THE OLD HOME DEADON D. Marri	Adamson

THE LORD OF THE MANOR.

By FRED M. WHITE.

CHAPTER I.

ME was when the Castlerayne estates marched for miles along the Yorkshire coast. Not so long ago the Castleraynes were people of importance; indeed, the head of the House could claim that distinction now.

On second thoughts, he did not so much make the claim as look upon it as a natural and indisputable right. As a matter of fact, the vast estates had been thrown into the crucible of change; they had gone as lands and fields will do under the sway of three generations of spendthrifts. The 'First Gentleman in Europe' had been a friend of the present owner's grandfather, and, after that, little explanation of the family fallen fortunes is needed.

The old castle to-day is a mass of ivy-clad, picturesque ruins, standing high on the seaboard and commanding inland one of the most exquisite prospects in the North. So far as the passer-by can judge, the grounds about the ruins are beautifully kept, whereat the would-be picnicker wonders and envies, for none of his class are ever admitted within the sacred precincts of what had once been a great feddal castle.

If you are bold enough to explore the rugged walls, or fortunate enough to get beyond the sunken dike where the moat used to run, you will be equally surprised. You will cross a brown troutstream filled with great gold-and-white lily pads; ron will see a quiet stretch of velvet lawn, with the gim ivy-clad walls of the fortress for a background. Behind the ruins is a sloping hill covered to the summit with larches and birches and rowans—a marvellous setting to the picture. And then you will note why the ruins are so carefully guarded; ior, nestling amongst them, built from their very stones, and knit into their very frame, is a marvelloasly beautiful and picturesque house covered with creepers to the roof-ties. The house has every uppearance of great antiquity; it has latticed panes in the mullioned windows, the upper halves of which are stained glass. There is something very romantic and charming in this refined house, protected by the frowning fortress beyond; something very cooling in the brown stream where the lily pads flourish. Then, if you are discreet, you will make a bolt of it, being perfectly satisfied why the general public are excluded so rigidly from Castlerayne Towers.

As to the house itself, it is pure Elizabethan, though as a matter of fact it is not more than a century old. All the same, it was built—stone and timber—from the remains of the older keep; every bit of panelling, every carved ceiling and cornice, had come from the parent place. The house, together with some four thousand acres of sour, poor land, is all that remains of the Castlerayne property.

But, poor as the land is, it is wonderfully beautiful and picturesque. It lies for the most part fringing the North Sea, a rolling prairie of short thymy grass and heather, with here and there deep dells filled with bracken and blackberry, sand-dunes, and green lawns the turf of which has not been disturbed for centuries. Here and there are deep pits, with banks of refuse at the sides-refuse now covered with heather-where once the tenants of the estate extracted small doles of plumbago. But the plumbago vanished with the rest of the family prosperity, so that to-day there is no sign of commerce there. As for the rest, the greater part of the estates was useless save as a living for a few hundred hardy sheep. Still, the prospect was wonderful, the air brisk and bracing, so that folks came from Hardborough in the summer-time and picnicked there. The bathing was splendid-far more alluring than at Hardborough, the great fashionable and residential watering-place some few miles down the coast. There were still greater and more prosperous towns within twenty miles, and [All Rights Reserved.] DECEMBER 1, 1906.

there were people who avowed that Mr Rayne Castlerayne had the making of a fortune if he would but transform the Towers estate into a watering-place. But nobody ever ventured to make that suggestion to Mr Castlerayne, for nobody had the necessary courage.

For the man's poverty was only exceeded by his pride. For eight hundred years there had been a Castlerayne more or less ruling over these parts. They had been warriors, divines, statesmen, robbers, in turn. Rayne Castlerayne never forgot that; the reflection warmed him on cold days, and kept him from worrying about his creditors. The slight little man with the clean-shaven face and hooked nose was not in the least like the head of an ancient race; he was shy and diffident so long as you took no liberties and remembered what he was. His eldest daughter, Angela, on the other hand, was all that one might expect from the class of Vere de Veretall, dark, exceedingly handsome, the beauties of her face softened by a pleasing smile and a little mouth that sometimes had a pathetic droop in it. There was another daughter, May, who quite incontinently was a Radical. Nobody quite knew where her sentiments came from, whence sprang the spirit of modern commercialism—those terrible ideas. For the rest, she was a pretty blonde, with charming easy manners, and no idea of the family

As to the household itself, it was greatly swayed—one could not call it ruled—by Miss Gertrude Castlerayne, sister of the head of the family. Miss Gertrude was small, a little faded and nervous; the face was relieved by a pair of dark eyes and abundance of silver hair, the rich silver that has gold flecks in the sunshine. There are certain old maids who are as beautiful and charming as their younger sisters, and Miss Gertrude was one of them. Nobody called her aught but Miss Gertrude, and all loved her, as was fitting they should.

There was a canker in the rose, of course—there always is; and the canker in this rose was a prosaic inability to make both ends meet. The metaphor sounds trite and vulgar in the case of such exalted personages, but that is what it came to. The poor land and the equally poor sheep made but scanty provision for the Castleraynes; the scattered tenants on the estate with difficulty paid their rent, though the spirit was willing enough. As May frequently said, things could not go on like this much longer.

'What is the use of our fine old name?' she demanded. 'It does not pay old Morris for his milk and butter; it does not prevent us from owing Mrs Lacey more than we can ever pay for meat. Dad is fond of saying that honour and integrity no longer form part of the character of the English people. And then he goes on to tell Sutton that he will send him a cheque next week for those seedpotatoes. Now, he knows perfectly well that there is not the slightest chance of paying Sutton next week or next year. And perhaps Sutton will make

his arrangements on the strength of that promise. Angela, I ask you, is it honest?

Angela sighed gently as she proceeded to tie back a refractory verbena. The garden was a blaze of sunshine; the wide stretch of dune and heather and bank was flooded with it. The whole place might have been Tennyson's 'haunt of ancient peace.' If the canker was here, it was certainly not in the hearts of the crimson roses.

'I calculate that we are six hundred pounds in debt,' the remorseless May went on. 'We are living at present on the charity of Aunt Gertrude. And I know for a fact that she has spent all her money but a thousand pounds. And here is a chance of making a steady five hundred a year for the rest of our lives. It drops into our laps like a godsend, and dad puts it aside as if some horrid brewer had offered to turn the old house into a tavern. We can't afford to be independent.'

'I call it gross presumption,' Angela said with dignity. 'Surely you have not given the proposal proper consideration, dear. For some time past we have tolerated the visits of trippers and the like from Hardborough, who make use of the common. They come here with their baskets; they leave a horrid litter in the heather'—

'There are a great many rich people in Hardborough,' May interrupted; 'and a good many nice people too. They are not all trippers. Hardborough is the queen of watering-places. I should very much like to live there myself.'

Angela very properly ignored the atrocious senti-

'Our father put an end to that kind of thing. He has been too lenient. Then he gets the offer you speak of from the Imperial Hotel Company. They are desirous of taking the old Dower-House on a repairing lease, and opening it as a high-class hotel.'

'Well, why not? The Dower-House is at present in ruins. Put it in order and reduce the grounds to something like form, and there need be no more charming spot in England. It would not interfere with us in the least; it would only mean that the visitors had the right to reconnoitre on the sacred common, and we should be five hundred pounds a year better off. We should be able to pay our creditors then, and look the world in the face. And the pensioners would not have to go to the workhouse.'

Angela blushed slightly, for May had touched her on a tender spot. For the pensioners in question were dependent on the family bounty—a sacred thing, a tradition that had come down the grooves of the centuries. High up on the common stood ten small houses in which were ten old men and women who had served out the measure of their strong years on the estate; and those almshouses went back to the seventeenth century. To a certain extent, the common was theirs; it had been given them by the founder of the hospital as a means of revenue for keeping up the hospice, subject always to the rights of the Lord of the Manor. In those

days plumbago had been found on the common, and the proceeds from the sale thereof had endowed the outages. But the plumbago had failed, and the peasoners had fallen back on the hospitality of the family.

South to say, the pensioners were having an exceedingly hard time of it at present. Besides the plumbago, there had been a certain well or spring d water containing mineral qualities, a well which had a place in history, a stream with a romance of its own, and the better class of visitors from Hardborough and the like had come there and drunk the water and left largesse behind, so that week in and week out there was as much as keep body and soul together in the hospice. And now the well had suddenly fallen away because, so May said, of the prome fact that the new owner of the estate adjoining Carlenyne to the north had been draining his property along the fringe of the sea. May brought up the fact now. She was terribly practical in her arguments.

'The offer ought to be accepted,' she said, 'if only for the sake of the hospitallers. For all practical purposes, the common belongs to them—I mean those kw hundred acres of it—and they can do what they like with it. My dear Angela, I could not possibly si down and see a chance like this thrown away. It will be no fault of mine if the chance is lost. I have taken the bull by the horns and written to Mr (Liford Warrener.)

ingle blushed pink as the verbena she was still training in the way it should go.

'Mr Warener is almost a stranger,' she protested.
We only met him a few times during our visit to
looke in the spring. And he is actually engaged
a trade, May.'

Son. May said cheerfully—'household soap.

Liter all, that is an honest occupation. Soap is a

nimble seet in the nation's balance-sheet. Any
ry, I've written to Mr Warrener, and he has

esgraphed saying that he will be here to-morrow

tizmoon.'

CHAPTER IL

HOLD in my hand,' Mr Castlerayne said oracularly, a most extraordinary letter. It is from a firm of solicitors in Hardborough, and refers to the offer of the but company as to that preposterous suggestion to the opening of a licensed house here. be policitors are instructed by their client, Mr hand Craggs, to oppose any such action, and the that the rights of the common are vested in is inspitallers under the deed of 17th December This deed I am prepared to admit; and here the strange part of the letter. The hosrailen will resist any attempt to infringe their in and they claim the free lease of the common ader the said deed; and, further, they claim that in a systed the sole authority to admit or prevent

any building on the common or the use of the said common for any other purpose save the right of sheep-grazing. In other words, they claim that the common belongs to them. Really, my dear Gertrude, your protégé Sam Craggs is going too far. For a Radical cobbler to oppose me like this!

Miss Gertrude flushed faintly. If the expression might be permitted about so impeccable a lady, there was the suggestion of guilt about her.

'Samuel is eccentric,' she admitted; 'and he has dreadful revolutionary ideas. He is fond of reading Carlyle and Adam Smith, and all kinds of formidable books. Still, he would never have gone into the hospital had it not been for the rheumatism that crippled his hands. And, like most people, he had no desire to starve. I don't know who told him about the proposal from Hardborough, but he had heard of it some time ago. It was he who gave me the first intimation of it.'

'And, of course, he was heartily in favour of it,' Mr Castlerayne said bitterly. 'It is just the kind of Radical progress idea to please Samuel.'

'Those people are living on my bounty, and they know it,' Miss Gertrude reiterated. A retort with her was so rare that she blushed at her own temerity. 'Fifteen years ago I wanted to close the hospital and send the poor creatures to the workhouse. But you would not hear of it, Rayne; the family dignity prevented you. Craggs may be all that you say; but the bread of charity is bitter to him; he does not like the flavour of it. He would like to see the offer accepted; he would like to feel that his weekly dole comes from people who paid honestly for a remunerative privilege. And he was equally certain that you would refuse to entertain the offer. He had a rod in pickle for you, he said.'

'A rod in pickle!' Mr.Castlerayne groaned. 'For me? He actually said that?'

'He did. I am afraid that Samuel is no respecter of persons. This he told me. He has been looking up the family archives; he has been to Lancaster, and examined the deeds relating to the Crown lands and the manors of East Yorkshire. He says he is quite sure of his ground, and that the commoners here have a vested right in the income to arrive from that part of the common whence the plumbago originally came. On his own initiative he has placed the matter in the hands of those lawyers in Hardborough, and they advise him that he has a good case.'

'Ah!' Mr Castlerayne went on, with one of his rare flashes of illumination upon him. 'As I know to my cost, the lawyers are expensive friends. And Craggs has no money. Who has been providing him with funds for this disgraceful litigation, I should like to know?'

No reply came to the question. Miss Gertrude's head was bent, a little red spot on either of her pallid cheeks. It was perhaps fortunate that the head of the House did not repeat his question. He muttered something to the effect that he would have to consult his own lawyers. He had not the

slightest intention of accepting that hotel company's offer, nor was he disposed for a moment to admit the claim of the preposterous and revolutionary Craggs. The bare idea that an old tenant on his own estate should take this step filled him with pain.

Angela had listened languidly to the discussion. On the contrary, May was deeply interested. Her blue eyes sparkled with amusement. It was evident that her dignity was not touched. Sooth to say, the Radical cobbler was by way of being a favourite of hers. Dreadful as it sounds, those two had much in common. May placed her arm affectionately through that of her aunt and drew her out into the sunshine.

'Come as far as the trout-pool,' she said. 'I have something serious to say to you. Aunt Gertrude, you are a wicked old woman who is deliberately conspiring to upset the peace and dignity of a once happy family. It is a good thing that dad is so dazzled with his dignity that he can't see as far as I can. To save you from prosecution, I am going to make a double charge against you. It was you who found the money for Craggs's action!'

'He didn't tell you?' Aunt Gertrude exclaimed.
'He never so far forgot his promise'—

'Not a single word did he tell me. But you are such a transparent old darling! When you blushed just now I guessed it like a flash. Not that I blame you, dear. Ah no! It would be nothing less than downright dishonesty for my father to refuse this offer. And yet he is so blind, so eaten up with his family pride, that he would not hesitate. I only hope that Craggs is right. He is an obstinate old thing, but he is as honest as the day. The idea is to force dad into some compromise. And if he fails'—

'He will not fail,' Aunt Gertrude whispered. 'Everything is absolutely correct. And I found him the money. I have promised to let him have five hundred pounds. Only, you must not tell this to anybody. I dare say you will think that I am a poor, timid creature, and that I should have told your father everything. But he can be very hard when he is roused, and-and I am very fond of Angela and yourself, dear. I hate the idea of having strangers here as much as anybody; but, as you say, it would be criminal to refuse this offer. I have urged your father to sell the place; but nobody would buy it at anything beyond the landvalue of the house, for the land around is so poor. I had thought it over day and night, and I have prayed to do right. I think I have done what is right. At any rate, I have done what is best for the happiness of the people here. And not one word'

'Not one,' May said solemnly. 'And now, go back to your jams and preserves, and let me take a hand in the business. I hope you won't be shocked, Aunt Gertrude; but I am going up to the common to meet a young man. You have heard me speak of Clifford Warrener?'

'The gentleman you met in London?' Aunt

Gertrude asked. She spoke in a studied prim and cold voice. 'I should say that it is hardly the proper'—

'Oh yes, it is. Mr Warrener is a business man. We were great friends in London in the spring. We are all the greater friends because he does not admire me a bit, and because he is very much in love with Angels. She refuses to look at him because he is in trade. Just as if that makes any difference so long as the man is a gentleman! Well, I gave Mr Warrener a good deal of our family history. You see, he told me all about Angels, and that established a bond of sympathy between us. And he said that some day he would like to come down and discuss a proposal with dad when he had time. He seems to know all this part of the country very well. And he seemed quite familiar with the name.'

'That is quite possible,' Aunt Gertrude said quietly. 'You see, I was engaged to his father at one time. They were dreadfully poor at that period, and Mr Warrener incurred great odium by going into trade. I believe he made a mess of it, poor fellow! but I never saw him again. Still, as a girl I was very fond of him. How foolish I am!'

May bent and kissed the cheek of the faded little figure by her side. She knew the sweet nature of Aunt Gertrude. She knew the life of noble self-sacrifice her aunt had always led. And here in these few simple words was her life's romance, the turned-down page she had hidden from everybody. And May knew at last why Aunt Gertrude had never married.

'You are a darling!' she said; 'and I love you better than ever. Good-bye, dear.'

May went up the slope past the hollow where the ruins of the Dower-House lay, with its magnificent range of scenery inland and to the sea; past the trout-stream and on to the common, where the wind was blowing fresh and sweet, and her feet were deep in the purple heather. Away at the back, behind a stretch of great pines, lay the hospital.

It was not all gorse and bracken and heather here; there were wide gaps and tracks made ages ago by the workers in plumbago, and turf eaten short and thick by generations of sheep. The grass was wonderfully thick and level, broken here and there by banks of undergrowth, little ravines full of sand, and heathy rainpits where the plumbago had been mined. To the left was the glorious sea, to the right a panorama of the kind that only the British Isles can afford. It was an ideal spot, and May sighed as she looked at it. On the whole, despite the mutual advantages, the hotel idea was not pleasing.

A tall figure in Harris tweed came towards May and raised his cap. The sinister hand of trade had left no stain on Clifford Warrener. It occurred to May that her sister was an exceedingly fortunate young woman, if she had only the sense

to see it. Then, without further preamble, May plunged into the subject that was nearest her heart.

'I am deeply interested,' Warrener said—'far nore interested than you are even aware of. Let as walk as far as the Dower-House and back to that turf yonder. And you can tell me everything. After that I may have a proposal to make.'

May talked vivaciously and well. The dark eys of her companion watched her with admiration. He smiled from time to time. Before the recial was finished the empty shell of what had been the Dower-House was reached. Below it was a keel plain like a platform formed of heather and gorse, and there lay an even patch of grass, the bents growing compact and thick like the foliage of the carnation. There were acres of it there.

'So the Radical is abroad.' Warrener smiled.
'I fincy I shall be able to find the way to bring Caggs to reason. When I was quite a boy he instructed me in the art of poaching—fish-poaching, for he was too honest to touch game. If I were to make Craggs listen to me, I could make the istane of your family at the same time. All this poor land'—

'Int is the trouble,' May said dryly. 'If it we rich land we could let it. As it is, the while four thousand acres is worth nothing. In my imagination I try to think what would happen if we were to find gold here.'

'I also have an imagination.' Warrener smiled. 'It is a mistake to think that the business man is devoid of imagination. On the contrary, some of the richest men I know have made their money by the exercise of imagination. Some people call it foresight. Well, I have had a fine flash of foresight so far as this place is concerned. Look at that levely turf, those rolling hills, the little brook with its feathery ferns; look at those sand-dunes over there. Take in the lovely prospect from the Dower-House. My dear Miss May, I can see the gold fairly bubbling out of the ground. I can see all that fine fringe of gorse and heath and heather over there by the sea selling for its weight in silver. The whole thing came to me when I was waiting for you. There is the fortune crying aloud to be picked up and dropped in your pocketa.

'Coal!' May cried. 'Dirty gray coal! The hideous blotting of the landscape'—

'Nothing of the kind.' Warrener laughed.
'Nothing shall disturb the peaceful serenity of the scene; nothing shall move the firmness of the prospect. Let us go to the top of the common, and there, under the seal of secrecy, I will tell you of my discovery.'

(To be continued.)

THE TRAFFIC PROBLEM OF LONDON.

By Captain George S. C. SWINTON, L.C.C.

S in the frame of the animal, so in the body politic of the city, nothing is of more paramount importance than free circulation. In both, stoppage or even stagnation means disease and death. The largest the supples

and death. The larger the surface, the more complicated the functions, the more impartive it is that there should be ample facilities it the rapid passage throughout the whole system is life-blood. And the life-blood of a great mannity is its stream of labourers and of the int of their laboure

On this small spot of the earth which we call laston, all trades, almost every calling, by which as live and prosper have through the past come seather for their mutual gain, in order that they get the communicate the easier. It is interesting to use how and why a city grows. The waterway of it hanes invited a scaport, and the building of a large across that waterway fixed the site of the lowest hand the protecting shelter of the fortress of its lover gathered the trade. The Government is town and the trade prospered. Not only did to the country made London its headquarters, and its town and the trade prospered. Not only did to be controlled to the greatest. She grew to be the greatest

capital of the freest people, and the crowds gathered to her from far and near. Remember, always for their mutual advantage. Then came the railways, and with them congestion. Alongside their tracks there may be solitude, but at their halting-places, much more at their junctions, much more still at the termini, where all that they carry is shot out, thicker and thicker becomes the crush.

There arrives a moment when the advantage ceases. We have got to the position when our London is too swollen and too expensive. She has outgrown her arteries, with the result that the streets have become overcrowded to a point which hinders traffic. Intercommunication has become difficult; it takes too long; and the advantage of living in community has gone. Our problem to-day is to look to the restoration of that advantage. If we do not, trade will go and fashion will go. Every man and every industry to which time means money will move out. For what do they gain by remaining? Land and labour are cheaper outside, and rates are lower. Why should they stay? In the past, enterprise brought the best of everything to London. There is a danger that in the future enterprise will lead both brains and capital elsewhere. But the poor cannot easily migrate, and they will stay to starve.

This may sound a somewhat overdrawn picture; but it is necessary to look ahead, and no one can view the increase in the cost of living, the non-employment, and the poverty in our central area without grave disquietude. On the face it is ideal, this moving out of the great industries into healthier surroundings, if it were not that only the best workers go. The residue (the older people, the infirm, the weaklings) remain behind to find fresh work if they can, but anyway to face the ever-increasing burden of the rates. Therefore, whenever we talk of London problems the one paramount consideration which we should put above all others is the preservation of our trade. We must fight that nothing should be done to injure it, that everything should be done to increase it. With all the difficulties with which she has to contend, it is only on the very soundest finance that London can continue to thrive.

This is more especially the case because in all matters of locomotion we are to-day face to face with a revolution. The railways, running along expensive tracks huge trains which stop only at few points, have been, as I have said, the most fruitful cause of congestion. The electric-car on the railroad, even more the electric tramcar proceeding along the common thoroughfare, will help to spread the people, and in a smaller degree the workshops; but the results of both will be infinitesimal compared to what we may expect from the commercial motor-car of the future. Remember that it is still in its infancy, that the forces of science are only now getting to work upon it, and that it will become cheaper and more reliable every day. The motor is going to restore the pre-railroad conditions of an open land; with the further advantage that, whereas the horse's range back or fore was limited to some ten or twenty miles, its range is illimitable. It is not only fast, but untiring. It will bring into profitable use for industrial purposes, and for housing purposes, fresh land far and near. It will cause the formation of new ways of commerce and new centres of both work and pleasure. And it may well sound the death-knell of some of the older centres, where the conditions of life and trade have become difficult and costly. It is time that we woke up.

Now, what are the cheapest and the best ways of keeping London up to the mark, so that trade and fashion, with all the wealth which follows in their train—wealth for the masses as well as for the so-called classes—shall continue to use it as their fountain-head? We must undoubtedly rectify the congestion. Travelling has got into the blood. People wish to be in and out and about. And they demand to move fast. If we are to compete with the world in these days we must have no waste. We simply cannot afford to take twice as long as is necessary to get from place to place. A man's time, whether he be a plutocrat, a salaried official, or a workman at the trades-union rate of wages, is too valuable.

It is a question as to whether much can be done to increase the uses of our great waterway. The unfortunate results of the County Council's experiment in steamboats are not encouraging. go to show that the experts were right who said that passenger traffic on a tidal river cannot compete with the more up-to-date methods of locomotion along its banks. The estuary of the Thames will always help to feed London trade, but the distribution from the docks must take place mainly by land-carriage. On the river carriage may be cheap, but it must inevitably be Also, in nearly every case there must be With the railways, also, there transhipment. must perforce be much costly handling of goods. The deliberate action of Parliament in early days prevented the railway companies from coming in to the centre, and we shall for all time pay the penalty of this short-sighted policy. The ideal city would have a mighty railway junction at its heart, with lines radiating in every direction. We have to content ourselves with a series of connections by circles. We already have two, the Inner and the Outer, and we are now promised yet a third, farther out still. At the heart of the town our London clay has come to our rescue, and so far as passenger traffic is concerned the linking up of these different localities where country travellers arrive will shortly enable every man to compass the distances, though not under the best possible conditions. Nobody will spend his time underground for choice. Nor will it be very easy, though undoubtedly in the next few years it will be seriously attempted, to make any great use of the tubes for the carriage of goods. By the use of carriage-lifts it may be possible to obviate some of the cost of handling; but there will be difficulties to overcome. We must all, however, appreciate the private enterprise which has sunk sixteen million pounds in the depths of the earth to give us a hundred miles of fast service, and wish it a good return for its

It is when we get off the private tracks on to the public thoroughfares that we see the tendency to go back to first principles. In the streets of London, as it will soon be in the streets of all cities-one might almost say as it will soon be on the roads, big and little, of all civilised countries -we are face to face with a conflict of methods of transportation. Horses are going; what is to take their place? Is it to be rails or no rails? Are we to have vehicles dependent on a connection, run on a track and tied to that track, practically street railroads, cheap and comfortable for passenger use but of little value to commerce, of necessity slow in crowded districts, and a source of serious congestion? Or are we to have vehicles carrying with them their own motive-power, quite independent, capable of being employed on any errand, starting anywhere, going anywhere, stopping anywhere, ending up anywhere, as liquid as

vater, and, some would say, as unstable? From which are we going to get the best value, the most comfortable, the fastest, the cheapest service, and the least obstructive to other forms of traffic? In the interests of trade we must always consider the last. We must not sacrifice everything for the convenience of passengers.

There can be no question that the tramcar must be more comfortable than the omnibus, and safer. Equally there can be no denying that a tramway waten must be more obstructive to other vehicles. The rails on which it runs are useful and economical to the tramway, but harmful to everything cise, while the cars themselves cannot give way; nor can they pass each other when full, or run express. The slowest car sets the pace of all, and a breakdown of any description across the line, whether caused by tramway accident or any other spaces, blocks the whole procession. We must lay it down that in a congested district the motoroms, which can worm its way round all obstacles or change its route, must be the fastest.

There remains the question of cost; and that, so is as London is concerned, I believe resolves itself into the consideration of whether street widenings are or are not needed. Remember that a tramway is exceptional in that it requires at any rate a minimum width of fourteen feet for a double tack, and of nine and a half feet on either side for one line of traffic. That is the statutory width; but every really progressive reformer would hold that on either side there should always be room for two lines of traffic, so as to give the power of passing a vehicle standing by the kerb. If that ie admitted, then a tramway-road should be fifty lest wide, exclusive of the pavement, and I need bardly say that there are very few routes along which extensive widenings would not be necessary. have elsewhere pointed out that to widen the main streets of central London the width of a trancer works out at about half a million pounds a mile; and to show that this is not excessive I all quote two instances which came before the County Council in the space of one fortnight. To vien to an average of twelve feet, ten at one ad and fourteen at the other, a frontage of sixtyin feet in Piccadilly cost thirty-four thousand ponds, or at the rate of two million four hundred isonand pounds a mile. I shall be told that this in expensive central position, and has nothing b to with tramways; the other instance has. It at widening in Fulham High Street, some five the from Charing Cross, necessary in order that the transay should be run from Putney to Here, to throw one-seventeenth of a are into the roadway will cost sixty-four thouby pounds. When such figures as these have to e faced, even only occasionally, we are compelled Even the wealth of London cannot tad such luxuries as a complete tramway throughout the centre. As in most diffithe result will probably be a compromise.

In the suburbs, right out into the surrounding country, and along certain selected wide thoroughfares—it may come to making new ones, but for the moment the Embankment is the most notable instance—we shall depend on tramways. The linking up, the threading of the narrow streets, must be undertaken by something less obstructive, less costly, and more fluid.

When we have decided this we have at one stroke wiped out a nightmare of many millions. Instead of the inelastic minimum width, it becomes a question of dealing with a few points of congestion, with street-crossings, with individual trades; with the approaches to the railway stations, the docks, and the markets; with theatre traffic, and other considerations of fashion. In places costly widenings may still be required, but the money will be spent for the advantage of all kinds of vehicles with their varying uses. And much may be left to the police. They must be given fuller powers and encouraged to use them, while that encouragement must come from some permanent body always working quietly at the problem in all its changing aspects, a body which will look far ahead and far afield, up in the air and down into the bowels of the earth, dreaming of traffic and of how it can be improved. Such a body has been recommended by the Royal Commission, and a Bill on the lines they suggest has been brought in by Sir John Dickson Poynder, who was a member of the Commission. Unfortunately it will meet with much unreasoning opposition, principally, I fear, from County Council sources. Mr John Burns has already declared against it, saying that the Council can themselves do all the work. I hardly think that among his multifarious duties he has found time seriously to consider the question, for the arguments in favour of an independent Board are so overwhelming. It is only necessary to mention three. The work must be continuous, independent of the exigencies of party and the changes which are bound to occur in a body re-elected every three years. It will be necessary to look twenty years ahead, to anticipate movements of population and developments of property. Then the area to be considered must be far wider than that controlled by the London County Council. The Bill proposes, and wisely proposes, the inclusion of not only London but the whole of Middlesex, thirtynine parishes in Surrey, nineteen in Kent, and fifteen each in Essex and Hertfordshire. Lastly, and most convincing of all, the Council by taking over the tramways has entered into competition with every other form of traffic. A competitor can in no way be a judge.

When the Traffic Board has come into being a great step will have been taken to guard the future prosperity of London. It will be the Board's business to find facilities for every kind of vehicle to pass freely wherever it wishes to go. The question of the vehicles themselves, their comfort and their motive-power, above all their speed, we must leave to the inventive geniuses of the future.

APART.

By J. STORER CLOUSTON,

Author of The Lunatic at Large, Count Bunker, &c.

IN THREE CHAPTERS .-- CHAPTER I.

O tall beech, though it might stretch to touch the clouds and its boughs swing airily, was ever rooted more solidly to earth than Ralph Delane to the London pavements. He was Town incarnate—the Town of talk

and hum and gleaming carriages and brilliant crowds and shady parks and high club-windows. All through his life it had been his taste, or his destiny, rather to hear the mouse squeak than the lark sing; in many languages (for he had travelled widely) the voices of the busy world had buzzed in his ears since his early youth; among countless men and women he had walked on carpet and flagstone, as seldom silent and solitary as one of a cawing flight of rooks, till in his very smile there seemed to linger an echo of the voices he had heard, as a reminiscence of the ocean is imprisoned in a shell.

Till the age of twenty, the second son of a merchant-prince who collected pictures, endowed a chair of Medieval Music, and belonged to the Carlton; from twenty to thirty, a younger brother and dilettante author; from thirty to forty-one, sole possessor himself of the family fortune, he was now the most perfect man of leisure in London. Where so many are idle, this was high praise indeed; but had you seen him strolling through the summer sunshine, his slender figure perfectly habited, a smile-a trifle bored perhaps, but always kind-ever in his eyes and ready to descend to his lips at the first sight of an acquaintance, the touch of imperial (shot with gray) conferring on him a singular distinction where another must have pleaded a dimple to excuse it, you would begin to appreciate the description. had you further enjoyed his society for only halfan-hour, his charm of manner, his erudition in so many provinces of knowledge that no busy man could find the time to gather the half together, the detached philosophy of outlook and catholicity of taste impossible to a combatant in the arena—these would convince a Socialist.

Nor did the danger lurk for him which had waylaid so many of the leisured when the shadows lengthen—the emptiness of lonely age; for he was married to one of the most charming girls in London. True, she was even now but twenty-five and he one-and-forty; but no one among all their innumerable friends had seen a hint of difference, a symptom of discontent, on either side. Besides, it were too crude, too inartistic, to think of this fortunate couple as suffering from the mean anxieties of workaday mortals. They were rich and not conspicuously extravagant; so that the foundation

of all happiness was firm beneath their feet, they had no enemies, and they were even reported to possess the consolations of religion should any improbable mischance require their aid.

As a summer night was drawing in, this man so favoured of the gods paced westwards, through the hum of London and the glimmer of its lamps, arm-in-arm with his best of friends. Had they looked upwards they might have seen, in the lame of sky between the house-tops, a few pale stars piercing the perennial haze; but their eyes seemed more apt to study instead the flagstones that still exuded the heat they had gathered all through the sunny day—so apt that one would think their spirits drooped too. And this suspicion was rather confirmed than otherwise by the forced note of cheerfulness in his friend's voice when at last he broke a long interval of silence.

'Our world is not such a bad place after all, Ralph.'

'My dear Leonard, let us leave bad and good to the School Board. I say that I find it rather less amusing than Clapham Junction. That is all.'

'You merely mean you are bored.'

'Just as Charles the First might merely complain he was executed.'

'You may joke'---

'I was never more serious, Leonard. The parallel is exact, for I am being bored to death.'

He smiled himself, and it was Farrer who now looked doleful. This intimate and sympathetic friend was a burly, bearded man, dressed for warmth and decency without thought of the pain his sagging trousers caused an artistic soul, owner of a dreamy gray eye, and editor of an important periodical. He answered nothing, and in a moment Delane laughed rather sadly and spoke again.

'Surely there are enough ways of putting a man out of his misery without resorting to slow torture?' Farrer looked at him with the air of a family

physician.
 'Has it been going on for long?' he inquired gravely.

'For more years than I care to calculate.'

'My dear Ralph,' said Farrer earnestly, 'why not take up your pen again?'

'The motive, my friend—the motive. I am one of those who believe that if William Shakespeare had inherited one thousand pounds a year we should never have enjoyed *Hamlet*. And I have inherited a number of thousands.'

His friend pressed his arm persuasively.

'My dear Ralph, you know I can always make room for your things. For instance, those critical essays you used '——

'Used!' exclaimed Ralph. 'You have said it all. I used to take exercise when I feared fatness. Now that I know I am numbered among the chronically lean, have you ever seen me move at a trot? Not even to dodge a bus, Leonard.'

'What about dabbling in politics, then? It is

the idle Englishman's refuge.

'I am neither quite cynic nor quite fool enough.' 'But, Ralph, doesn't the thought of reputation'---

'I have seen how they are made.'

Or trying to do some good in the world?'

'I have observed the mischief that ensues.'

Farrer frowned thoughtfully. 'You have completely cut your connection with the business?' he asked

'That was my last serious intellectual exertion: againsting the sale of my interest in Delane and Son It was done within six months of poor George's death.' He looked at his friend quaintly. 'Do you know, Leonard, I believe my brother died to prove himself right. He always used to declare that I was happier as an impecunious dabbler in the arts than I'd ever have been as heir to our lather's fortune. For the same reason I feel conmed he kept himself a bachelor previously. Curious example of the pertinacious arguer, wasn't

For a few minutes Farrer made no reply. Then he mid, 'You hinted at taking some desperate

'Leonard, I am tired of this town.'

'Ired of this town!' cried Farrer. 'My dear fellow, you are this town !'

A busy man himself, basking in a fine evening's thenes, he could find no words adequately to upress his wonder. The delicious warmth, the arnad lights, the mysterious dark houses, the raispering young leaves, the spell of revelling samer London how they soothed and how they sired! While here was the essence of London

'Like Beelzebub,' smiled Ralph, 'London is trided against itself. Part-its silk hats and anibuses, its stucco and twopenny tubes-will tay where they are, near the Thames and not far me the infernal regions; the rest will retire to a er are and a leaky roof my father once bought I reland under the impression that his ancestors cold with a "y" and represented a line of

What! Not Bally-- What is it?

have no more idea than you. The last few riales will always elude me.

I thought it was a bog on the edge of the Linux.

'So it is.'

farrer stared at him.

What, in Heaven's name, will you do there? Think and breathe! You wouldn't imagine I a rest-cure ! My spirit does, Leonard-my an whatever you like to call it."

Leonard looked at him oddly out of the corner of his eye. Twice he seemed about to speak and then to hesitate. The third time the words came, blurted awkwardly as though his judgment knew not whether to let them escape or not: 'But-you haven't forgotten you are married?'

Delane seemed to stiffen his back a little.

'Am I likely to, with the name of Mrs Ralph Delane four times a week in the Morning Post, her photograph in three series of "Amateur English Beauties," and the bill for her last gown in my pocket at this moment?'

A look of physical pain passed over Leonard's face.

'Don't be cynical, Ralph, about '--- He hesitated.

'About marriage? My dear fellow, you talk as a reverential bachelor, standing beside the area railings of the happy Benedict's house and peeping enviously through the chinks in the curtains. It does look warm and comfortable inside-doesn't it? Never saw such a happy household before, did you?'

He laughed, but not infectiously. Indeed, it was in a very low and miserable voice that his friend said, 'I always thought your marriage perfect.

Ralph retained his perfect composure.

'Yes, it is true that there hasn't been a black eye yet between us. Negatively, Leonard, my marriage has been-as you surmised-perfect.'

'Is that really all you can say?'

At last Delane spoke as though he were moved.

'All I can say. What I feel-what I thinkwho can guess that has not loved so that the world's horizon was crimson with the fires of dawn, and then watched the colour slowly die out of the sky and the heavens change to London drab?'

Leonard pressed his arm more closely.

'Has anything happened-anything'-

'Absolutely nothing. She has danced in one direction, I have sauntered in another, till suddenly I have realised that between us we have covered several million miles. Now we are as far apart as an average pair of stars-or an average husband and wife.

On the surface, Farrer seemed the more moved of

'My dear fellow! my dear fellow!' were all the words he could frame; and then in a little, 'When do you leave London?'

'To-night.'

Farrer started.

'But Esther-I thought you told me she was going to Lady Wilsden's dance?'

'She will be putting on her diamonds at this moment.'

'Then she doesn't go with you?'

'I have not asked her yet. In fact, she doesn't know I am going.'

Leonard stopped short and turned himself to confront his friend.

This movement withdrew his arm from Ralph's; but instantly Delane slipped his through Farrer's and said in a tone of affectionate persuasion, 'My dear old Leonard, I have a very great favour to ask you. Of all my friends, you know Esther best. I want you to break this news to her.'

Farrer stared at him.

'What the deuce !--why can't you tell her yourself?'

'I hate scenes.'

'Do you imagine I enjoy them?'

'There will be none, I assure you. Esther is too well-bred to cause a scene with a man she isn't

Unheeding his friend's continued stare, he took a letter from his pocket and went on: 'In case you failed to turn up to-night I wrote you a letter explaining the situation. Take it, and quote any extract you please. It may make the iob simpler.'

'You actually wish me to do this?' demanded Farrer. 'You would leave such a thing to another man ?

'Leonard, old friend, don't you know me well enough to guess how impossible such a scene would be for me? I gave up shooting because I couldn't bear to see a wounded bird flutter. Do you think I can hurt Esther? When I contemplate itsaying the words I have said to you, tearing the veil of outward affection that has always hung between us and the dismal inward truth, I know I should break down. One tear, one cry of protest, and I should beg her pardon, kiss the tear away, and resume the old weary round. And we must get out of it somehow, Leonard. But how-but how? Honestly, I see no other way but leaving her. If she follows-well! If she doesn't-well again!'

Farrer gazed at him compassionately.

'Has she never realised all this herself?' he asked gently.

'No more than the dancing motes in a sunbeam realise it is frosty outside.'

'Ralph, tell me truly-do you care for her, or don't you?'

'I spoke just now as if love had died clean out; but would I feel so unhappy if it really had?

Farrer was silent for a moment; then he said, 'If I am going to see her, it should be at once. Suppose I turn up at Bertha Wilsden's? She's my cousin. I can tell her I want to study modern ballroom customs with a view to an editorial. I don't suppose she would mind much.'

'She will merely stipulate that you mention her by name in your article.'

Delane spoke like his quietly caustic self again; but as he pressed his friend's hand over the door of a cab his grip was more eloquent of gratitude than any phrase. All he remarked was, 'Don't forget your white gloves.'

'Thanks for reminding me,' said Leonard simply,

and drove off through the dusk in company with many thoughts.

'Man is certainly an odd kind of ape,' they ran. 'Here am I, a person of quiet tastes, a creature content in a library of books, an anomaly at balls, a foreigner to more than half the men at my club, and yet I am happy enough here; while Ralph Delane, the very essence of everything in town, runs away from it to meditate in a peat-bog. And all to escape from the most charming woman in England. Bachelors, beware!'

Meanwhile Ralph Delane strolled more and more slowly, as if he were lingering for some set purpose, till at last he drew near his home. This house stood in a long square where a fine show of tall trees and dark foliage towered in the midst of silent, white-walled mansions. A carriage stood by the kerb, and, as he approached, the vision of a white opera-cloak flitted from the house into it, the coachman whipped up, and a pair of horses rattled swiftly by him. He never turned his eyes towards this carriage as it passed; but when it was gone his step notably quickened.

His valet entered his study in answer to his ring.

'Mrs Delane gone out?' he inquired.

'This moment, sir.'

He seemed satisfied and not surprised.

'Nearly finished my packing?'

'Almost, sir.'

'That is all.'

He fell into a chair and took a cigar, but for a time sat there too absorbed in thought to light it. Then his eyes roved to the mantelshelf, and after gazing for some moments he rose and came up to look more closely. It was a small photograph that so riveted his fancy—the photograph of a girl. Delane stared at it, sat down, and then a few minutes later rose and stared again. Four times did he rise and sit, and then at last, moved by an impulse too strong for him, he picked it up and slipped it into his pocket.

'You fool!' he muttered, smiling wryly at his

He started as the door-handle turned, and placed himself instinctively to hide the gap where the photograph had stood. It was his butler who entered.

'A man to see you, sir,' said he.

'At this hour? What name?'

'He didn't give any, sir.'

'A gentleman?'

The butler hesitated.

'He might, sir, be described as such-nowadays.'

'What is he like?'

The butler hesitated still more.

'Begging your pardon, sir, he-he is not remarkably unlike yourself, sir.'

Ralph raised his brows and looked at his watch.

'All right. I shall see him.'

He returned the unlit cigar to the box and went down to the library.

(To be continued.)

FAT QUAIL

By 'SNAFFLE.'

OST people who are in the habit of passing through the streets of the west end of London must have noticed the words 'Fat Quail' posted up in the poulterers' shops; but few

of them have considered what is really involved in the existence of such notices. It used formerly to be the practice of such establishments to expose to the public view large flat crates, through the apertures of which the little heads of the smallest of the fowl-tribe were frequently protoided. This practice has, I believe, now entirely ceased, probably less from any humane notive than from an uneasy feeling on the part of the poulterer that he is undoubtedly breaking the law by being in possession of these birds at all

The law is often ambiguously set forth in Acts of Parliament; and to this fact the Acts relating to mimals and birds form no exception. Many readers will recollect the late Sir William Vernon Harcourt's expressed intention 'to put an end to all rabbit-trapping in the open' when he introduced the Ground Game Act. Yet the very first test can taken under the Act resulted in the decision that, as the preamble of the Act spoke of tenant-famers only, the provisions of the Act could not affect others; and there is to-day more trapping in the open than there was before the Act was passed.

In the same way there has been a doubt as to the construction of the Wild Birds Protection Acts, so is a they relate to the live-quail trade. In the first place, the original Act of 1880 undoubtedly sancioned this trade by making it illegal to expose wild and for sale unless the seller could prove that they bought or received from some person residing out of the United Kingdom. It was thus the law, however absurd, that a migrant bird, which would have arrived in England within a few hours, might raily be captured in Pas-de-Calais and sent to Lagand by the next steamer. But in the followof year this proviso was repealed, and a new time was passed which related to dead birds alone. therefore, the offences of exposing or offering for at or having control or possession of, any live bird recently taken have now no legal excepto that there should be no reasonable doubt is the London poulterer is liable, on a second contition, to a fine of five shillings for every live and on his premises. It is, therefore, not to be red at that they are no longer exposed to the view of the passer-by. But they are on the

There is moreover, a much simpler way to stop is illegal traffic. If the Society for the Protection is lively would make it its business to take action

at the docks where the birds are landed even concealment would be impossible. Rail and steamship companies would soon refuse the illegal consignments, and the trade must come to an end. The representative of the Protection of Birds Society might well be accompanied by an inspector of the Royal Society for the Prevention of Cruelty to Animals, who, I can assure the council of that society, would also find plenty to interest him in the crates. But this is a branch of the subject to which I will return later.

To come back to the question of law. The meaning of the words 'recently taken' has been disputed; but it seems to me clear enough. A bird recently taken is one that has been taken since the termination of the period during which it was lawful to take it in this country. It is sometimes difficult to prove that any particular bird is a wild bird, but less so with quail, which do not, I believe, breed in captivity. It has also been suggested to me that the 'taking' must be contrary to British law; but I think there can be no doubt that the Act of 1881 disposed of this point. The Act of 1880 made the exception which was expressly removed by that of the following year.

The quail is, as I have before mentioned, a species of the gallinaceous or fowl tribe. There are various kinds of quail, varying in size down to the tiny 'button' quail of tropical Asia; and of these the common quail is the largest. It may be well here to remark that the still larger 'American quail' or 'Bob White' is not a true quail at all. The common quail, which is found in most temperate parts of the Old World, is of course a British bird, though for reasons into which I shall presently enter it has become a rare one. The present writer, though familiar with the birds in many lands, has only once seen a 'bevy of quail'-this is the correct sporting term-in Britain. That was near Waddesdon in Buckinghamshire. But only last year he was fortunate enough to hear the bird's well-known call, 'Wet-your-lips! wet-yourlips!' within a dozen miles of London, in Essex. From its habits, the quail, like the landrail—which bird, by the way, the Germans quaintly entitle 'the king of the quails' (Wachtelkonig)-is more frequently heard than seen. I have often been amused by watching one of the enormously heavy, old-fashioned German pointers working backwards and forwards in a small potato-patch, with the result that perhaps two or three dead 'points' only resulted in one's discovering that the bird had crept off again. At last the dog would stand in a spot where there really hardly seemed cover for a black-beetle, but when one approached him, whirr! the bird got up. Quail-shooting, however, is but poor sport. The bird is not so much easy to hit as difficult to miss, so simple and straight-away is its flight. Moreover, if it does escape, it never goes far, and, with a good dog and plenty of patience, is sure to be flushed again. Every year a few are shot by our own partridge-seeking gunners, and, strange to say, more often in Ireland than in England. Some were so shot this year in Monmouthshire. As a rule, however, the lateness of the English harvest enables the bird to commence its southward migration before the gun is much en evidence in this country. In Ireland quail are legally protected until the 19th of September, which makes it quite remarkable that any should be shot there at all.

Quail winter, as a rule, to the southward of the Mediterranean, though I have met with a few birds right through the year in the island of Cyprus and elsewhere to the northward of that sea. Drawing together from the whole of upper Europe, the birds pass in great numbers-each flock being composed of one sex only, cocks or hens-along the peninsulas which project south, and then cross the sea, using the islands which dot the Mediterranean as intermediate halting-places. They are everywhere welcomed (?) by the local gunner; and, having regard to the time of year, one can hardly object to this. In fact, it comes under the head of legitimate sport, and if the birds were left alone on their southward journey, it would hardly have any appreciable affect on their numbers. Once across the sea, they may consider themselves fairly safe, though some are shot and snared during the winter in Africa, and especially by visitors to Egypt.

It was presumably in late autumn that the journeying Israelites fell in with the quails, which must have been exceedingly plentiful in those remote ages. Moses, as an educated man, would, of course, have understood, and even expected, the occurrence; but that the thing should strike the Israelites as wonderful seems quite incomprehensible when it is remembered that these people had been living for generations

in Egypt.

Centuries elapsed without in any way affecting the habits—which, indeed, are still unchanged—or the destinies of the quail. A certain number would be taken in nets and eaten, and some no doubt were despatched alive to figure in the banquets of ancient Rome. It is, however, improbable that even the general introduction of firearms much reduced their numbers. What did do so was the increased facility for rapid despatch to the great centres of population.

Let us follow them on their journey; and remember that it is a journey undertaken for the purposes of breeding—a fact which would, as a rule, extend the sympathy of the roughest classes of sportsmen to a bird. First of all they collect in Lower Egypt, and there the fellah is busy with his nets. But I propose to deal with Egypt separately. Across the sea go the little travellers;

and when they alight on the Greek islands they find them bristling with nets. In fact, a majority of the birds never do alight, but fly into the nets, and are promptly taken out and basketed. One of the first things that opened the eyes of the British public to the enormities of the quail traffic was a consular report showing the vast numbers of these birds annually exported from the island of Cerigo alone, an island not so long ago a British possession. It is said, and I fear with truth, that in the Greek islands the natives have a peculiarly cruel method of attracting the quail. The birds first caught are blinded and put in cages in the sun behind the nets, so that their cry may attract new arrivals. But where the whole traffic is so cruel it is hardly worth specifying any particular part of it. As a rule the quail-pipe is used to attract the flocks; and even this is not absolutely necessary, as if the nets are left quiet and undisturbed nature will bring victims to them. Many of those which escape the nets fall victims to the prowling Greek gunner; and indeed they are pursued ruthlessly right up the Adriatic shores. Once they reach central Europe they are safe for some months. Those who adopt the more westerly routes have equal troubles. They are netted on the coasts, and indeed inland. In Italy, to the eternal disgrace of a country calling itself civilised, battues are organised; and in April the Roman papers teem with accounts of the hundreds of quail shot by the Duca di - or the Marchese di it any wonder that, when we deduct the birds which stop to breed in France and Germany, few indeed are left to come on to England? Let us return to those which have fallen into the

seized-by hands not intentionally rough, indeed, for the live birds alone have a value, but hastyand crammed pell-mell into crates, which are shipped as quickly as possible on steamers and taken away. Some years ago it was said that France and Germany had agreed to prohibit the transit of live quail. Whether this was ever carried out I do not know; but if so, the birds brought to England come by the Bay of Biscay. In any case the obvious result of hunger, heat, want of air, and overcrowding is greatly to reduce the live contents of the crates. It would be interesting to have the figures of the live birds despatched and the live birds—out of the same crates—actually received in London. Yet I am told that 'to successfully prosecute for cruelty in packing and transit we should have to prove that it is "illegal" cruelty, and that it was done on our shores.' The idea of legal cruelty is, I confess, new to me; and if the birds are anybody's property when they land, that

owner should be responsible, and forfeiture of the

crates should be part of the penalty-one which

would catch the alien owner also. But, as I have said before, I am not without hope that the

existing law will put a stop to all consignments of

live quail to England. I am not sanguine enough

hands of the netters. The terrified creatures are

to expect to see the item of cailles-en-aspic disappear from the menu of all our summer 'functions,' beame, of course, it will be worth while to send a seamer with cold storage accommodation to a few principal points in April; but there will not be any market for live birds in England. And when we have put our own house in order, we can then with more reason approach other states. Italy has long been considered incorrigible in all matters relating to bird-life, and I am afraid with reason; but perhaps if we urge upon her the example of cirilised nations to the northward something may be done.

It has been said that, Egypt being to a certain citent under our control, England should interfere to sup the netting of quail in that country. In the first place, however, the entire administration of Egypt during the last quarter-century goes to show that we have always avoided as much as possible any interference with what may be called domestic matters in that country. In the second, if the Egyptian Government were asked to interfere,

they would no doubt point out that what they were being asked to do was to deprive their people of a certain amount of profit in order to increase that of the Greek peasants on the other side of the Mediterranean, but that the birds would be netted just the same.

The first thing to be done is to stop the traffic in live quails in this country, either by the application of the present law, or, if that prove insufficient, by the enactment of a new one. We shall then be in a position to approach Germany (a country always ready to enter into an equitable arrangement for the protection of game), France, and Austria. Italy would probably follow so strong a lead; and the thing might then be said to be done. No doubt once the netting of quail was put an end to an increasing number of these birds would find their way to our islands annually, though it is probable that some considerable time would elapse before our meadows and corn-fields would in spring everywhere echo the cry of 'Wet-yourlips! wet-your-lips!'

SOME HIGHLAND SUPERSTITIONS OF THE PRESENT DAY.

By D. MACLEOD.

N this solitary and exposed Highland hamlet by the North Minch where these lines are penned we are but little disturbed by the various public questions that agitate people in the great world. Whatever meagre

howledge we possess of the social, economic, and political problems that trouble the nations is gleaned hom the columns of our favourite weekly newspers. The clash of political arms that marked the last General Election reverberated for a time mong our quiet glens like the echoes of a distant hunderstorm, and created some little stir in the laid waters of our sequestered life. Then the Church question still forms a bone of bitter conention, especially on Sabbath-days, between neighbers who are in all other respects on the most rendly terms. As a community we are very constrative on all questions except those relatmy to the Land Laws, and on these we are red-hot dials to a man. For the rest, we are content blare things as they are. Innovation in any in we regard with suspicion and distrust. We mader it wiser to bear with the hardships and petr wornes to which we have grown accustomed than to invite others in a guise with which we are

Thus it is that we cling tenacionaly to habits and cutous of a past age. It is a common saying with a bat our ancestors were better men than we are, so it is a what was good enough for them is good enough for ma. But it is to be feared that this

philosophical dictum is often used to cover our apathetic attitude towards matters that clamour for immediate attention on our part. For we are by no means averse to changes that bring in their train greater personal comforts, so long as they do not exact too much individual effort. As a matter of fact, we are rapidly acquiring luxurious tastes and habits. This is one of the inevitable results of our position on the very fringe of civilisation. It has been said that the luxuries of one age become necessaries in the next; and we are proving the truth of the saying.

It is, however, in our beliefs and general habits of mind that our conservatism exhibits itself in the most marked degree. Our attitude towards religion is of the stern, uncompromising kind which the most extreme sect of the Covenanters adopted in the south of Scotland close on two hundred and fifty years ago. Our views regarding other aspects of the supernatural are being slowly modified by the spread of education. But we are still extremely superstitious in the vulgar sense. Not only do we believe in ghosts, goblins, and other products of second-sight; but we have among us a few old men and old women who can point out the hills and hollows where the fairies held their orgies when they themselves were lads and lasses, and they become quite garrulous on the subjects of waterkelpies, the 'evil-eye,' and various other uncanny things. If one had the time and inclination to write down the weird tales told by these survivors of a past age, one could easily compile a fat volume

of varied, and on the whole interesting, matter which would bring us wonderfully near the dark days when superstition held almost undisputed sway in this remote corner of Scotland. But for obvious reasons we must confine ourselves in this paper to forms of superstition that are still, or were until very recently, not uncommon in many out-of-the-way parts of the Highlands. We deal with three different aspects of the subject: the influence of the 'evil-eye' (to which was attributed many forms of illness), witchcraft, and second-sight.

'Bless you!' or its Gaelic equivalent, is an expression that frequently falls from the lips of a Highlander. It is not uttered as a mere purposeless exclamation, but rather as a genuine appeal to the Almighty in some one's behalf. Should you stumble when walking or choke in the act of swallowing a dry biscuit, your companion, if you have one, immediately shouts, 'Bless you!' The same words are also used to guard against the influence of the evil-eye. Indeed, they are equally potent in counteracting any malign influence that may consciously or unconsciously lurk in your own eye. If you comment on the size or beauty of a child, or count the individuals in a flock of sheep or in a herd of cattle, and not use the magic words, the chances are your hearers will look askance at you; and woe betide you should aught untoward befall the objects of your attention. Deiseil (sunwards, or turning from south to west according to the apparent course of the sun) has much the same significance as 'Bless you!' but in a limited sense. If, when you are in the act of eating, a crumb or other particle of food goes down 'the wrong way,' 'Deiseil!' is interjected as an antidote to any possible mishap. A Highland fisherman usually turns his boat (especially a rowing-boat) deiseil. At one time, when a birth took place in a family it was customary for a member of the household to walk seven times deiseil round the house, so as to oppose an invisible but impregnable barrier to any of the 'little folks' (fairies) who might have had designs on the new arrival. As a similar precaution, no fire or light could be taken out of the house before the infant was seven days old. A stye on the eye is charmed away by the use of a certain incantation in which the numbers one to seven and seven to one backwards are repeated without drawing breath, while the first finger of the right hand makes a pass over the affected organ as each number is repeated.

Most people have heard of the healing virtues attributed to a seventh son when no daughter has intervened to break the continuity of succession; but the cure for lumbago is perhaps one of the strangest, and to the patient frequently one of the most trying, that could well be imagined. The patient lies prone on his face, while one who has made an abnormal entrance into the world—that is to say, who has presented himself in the position in which human beings are usually conveyed to their

last resting-place—travels twice along his back, from the loins up to the shoulders, and back again to the starting-point. A few years ago the writer saw a woman of small proportions undergoing this drastic treatment, the leech being a man nearly siz feet high. Needless to say, he had his boots off. The experiment was tried in a field in the presence of several people, who seemed to expect great results from the remedy.

The cure for toothache is a species of faith-healing. In many of the crofting and fishing townships on the western seaboard of Ross and Sutherland, and in the Long Island, there is a 'specialist' in dental diseases. A friend of the writer, whose curiosity had got the better of his discretion, once visited a woman of this class with a pathetic account of his sufferings from toothache. The woman wrote some words on a piece of paper, which she then carefully folded up into small compass, and told the bogus patient to hide it where no one would be able to find it. He himself was threatened with pains and penalties should he either glance at the inscription or reveal the place of concealment. The prying rascal had no sooner got to a respectful distance from the woman's domicile than he eagerly examined the paper. In a sprawling, barely legible hand were written the words, 'Believe, Peter, and thou shalt never feel toothache.' As Peter was not the youth's name, he concluded that the magic sentence was intended to pass as a quotation from the New Testament. Bleeding from the nose or from a wound has also its 'specialists,' who, it is believed, can quench the flow of blood without even going to the trouble of seeing the sufferer. To prevent serious consequences from the bite of a mad dog, the wound is washed with water in which the animal's teeth have previously been cleaned. A somewhat gruesome remedy is that recommended for the cure of rheumatism. A live cock, the common domestic chanticleer, is cut lengthwise in two halves, and the ghastly pieces, while still warm, are applied to the affected parts. It is noteworthy that infectious diseases are not included in the list of ailments which are believed to yield to the influence of these novel methods of treatment. The omission is significant, for Highlanders are inordinately afraid of infection.

The sphere of witchcraft is a fertile field to explore, more especially that side of it which deals with the domestic animals. Of these last, the cow, being the most valuable, was naturally regarded as the most susceptible to the baneful effect of the evileye. The witch is a creature peculiar to no one country. The species is as cosmopolitan by right of birth and upbringing as the type is by virtue of her privilege to ride on the wings of the storm seated on a broomstick. Her mode of life differs with different countries. The power of aerial locomotion commonly attributed to her never, strangely enough, received recognition in Highland folklore; but she is credited with the power to transform herself, if the need arise, into one of the lower animals, a

hare by preference. The advantages accruing from being able to undergo a process of metamorphosis at will are obvious and manifold. Four feet can carry one out of danger more speedily than two, identification becomes difficult if not impossible, and a small object such as a hare can prowl about a cow-shed or among a herd of cattle grazing in the fields with a greater chance of escaping detection than a human being. A hare-that is, a witch in disguise-is invulnerable to an ordinary bullet. Nothing but silver can prove effective, and many stories are told of samekeepers having with a doubled-up sixpennypiece successfully wounded a suspicious hare which has proved itself bullet-proof. An incident of this kind which happened not long ago is worth telling. A crofter had reason to believe that one of his best cows had been bewitched, and being a notorious poscher and good shot, he loaded a gun with a bent supenny-bit and kept a patient and watchful eye on his cattle. For several days nothing happened. Then his vigilance was rewarded, for in the quiet dusk of an evening he surprised a hare moving in dose proximity to his cows. Taking careful aim, he fired and wounded the animal, which, however, impingly made off. Next day he learned that an oil woman who lived with a sister, also aged, in a small hut in the neighbourhood, and who had amed for herself an unenviable notoriety as a witch, The seriously ill. The crofter's suspicions were amply confirmed when it was discovered that the aster rigidly excluded all neighbours from the house until the patient had recovered.

But witches are generally too wary and too nimble to fall into a trap. So they must be met with rapons similar to their own. Baleful as is their power, its effects can be counteracted by pitting winst it an influence more potent still, but of a tind that acts for the good of humanity. It is the id, old story, as old as man, of good versus evil, and good eventually gaining the day. The usual remedy is a bewitched cow is as simple as it is efficacious a the estimation of its votaries. Silver is again he magic element in the ceremony. You put a alter coin or a silver ring into a basin of water, wi you sprinkle the cow with the sacred fluid. If it animal shakes itself—which it usually does, for are not over-fond of water except for internal *-you may reckon the treatment has been highly Rossful But you can never depend on bovine expensies, and once in a while it happens that a minal is either absolutely indifferent to the pention or follows it with large, pathetic eyes, tile elections the utmost care that the priceless type are not dissipated by the least movement on part. When this happens you substitute gold it siver, and repeat the experiment. Should the or sill continue obdurate there remains the final ad supreme remedy. You get a pail nearly filled The valer from a running stream, and into it you in teren blades. Note the frequent recurrence the mysic number. Should the cow remain iterent after a third shower, its case is hopeless in the extreme. But the probability is that the laziest and most docile type of the bovine species will resent so much embarrassing attention and shake itself dry. This last circumstance undoubtedly explains the reputed virtue of the 'water off seven blades,' as it is technically called. The blades in question are the cutting parts of seven different sharp instruments. The difficulty of securing such a large variety of weapons is avoided by the use of pointed instruments if necessary. Thus a pin, a needle, an awl, a knife, a pair of scissors, a sickle or reaping-hook, and a scythe-blade would complete the list. Instances have been known in which the goodwife-who invariably delegates to herself these rites-has utilised her husband's razor, and, omitting to dry it, allowed it to get encrusted with rust. The next time the husband attempted to get through the uncomfortable but necessary ordeal of the weekly shave, lurid language would permeate the house, and the goodwife would likely find it an easier task to overcome the pernicious effects of witchcraft than allay the righteous wrath of her husband.

The gift of second-sight may be put into a different category. While no special qualification is essential to the exorcist, only certain persons, the 'fairy-kissed,' possess the faculty of second-sight. Indeed, those who are endowed with the gift of prophetic vision are subject to eerie and unpleasant experiences. Few people, if any, are brave enough to meet a ghost—the spirit of a deceased person appearing in human form—without quailing; nor can one contemplate an encounter with a wraiththe spirit of a living person-with any degree of comfort when one knows that the prototype may, at the same moment, be a hundred miles away. Of ghost-stories there is no end, and those current in the Highlands are not materially different from those encountered in other countries. Belief in that phase of second-sight which consists in seeing wraiths or some event prior to its actual occurrence is not confined to any particular country or to the uneducated classes. Numerous instances could be given illustrative of the widespread belief among Highlanders in this form of second-sight; but two must suffice. Both are of comparatively recent date, and the writer is in a position to vouch for the accuracy of the main facts of each case. In a small township in the north-west Highlands there lives a young man who, on several occasions, announced to his startled friends that he had seen a vision. Two years ago a near relative of the youth was seriously ill. One night the latter, in the company of a friend, was returning home from a visit to his sick relation, when all at once he stopped, doffed his hat, and, to the awe and astonishment of his companion, explained that a funeral procession was marching down the road in front. He recognised and named several members of the ghostly company. A few days later the sick man died. On the day of burial the young seer, who with his companion of the night of the vision accompanied

the mourners, pointed out from among the funeral party the very men he had seen on the former occasion. This incident may perhaps be thus explained. The 'fairy-kissed' youth is neurotic and excitable, and a firm believer in second-sight. left his dying friend, his mind would doubtless stray towards ghosts and funerals. Likely enough he quite expected to see some vision, and his lively imagination did the rest. As to the individuals he recognised, they were near neighbours who would in all probability be present at the funeral.

But the most ingenious theorist will find it difficult to account for the following case. The scene is laid in Sutherlandshire. One evening a crofter was sitting outside his cottage door, when he saw a stranger coming along the high-road towards the house. He watched the man for some minutes till, leaving the main road, the traveller took a branch path leading to the crofter's door. The crofter then stepped inside for a moment to inform his wife of the approach of a visitor. On going out again he was more than puzzled to find that the stranger had in the brief interval completely vanished. The house stood, and still stands, on a slight eminence from which an unobstructed view can be had of the immediate neighbourhood. But though the astonished crofter looked on all sides he could see nothing further of the stranger. None of the villagers whose houses he must have passed had observed him. It is important to note that the crofter there and then gave a full description of the man to his wife and to a brother. In a short time the incident, uncanny though it was, was forgotten. Some months later a child of the same crofter was suddenly taken ill. The doctor, a young practitioner who had but recently come into the district, was sent for, and in the course of the day the father was standing at the door of his cottage waiting impatiently for the doctor's arrival, when at a bend of the road appeared the mysterious stranger of several months before. He turned out to be the expected doctor; but in features, dress, and appearance generally he was the exact counterpart of the individual who had formerly presented himself. On inquiry, it was ascertained that the doctor had never before been in the neighbourhood, and on the particular day in question had been in the south of Scotland. The crofter, his wife, and brother, most respectable and estimable people, are still hale and hearty, and fond of describing this remarkable incident.

It would be easy to multiply these examples of the varied character of present-day Highland superstition, the lingering symptoms of a darker age, the shortened, attenuated shadows of the morning which will vanish when the sun shall have reached its zenith. For education is slowly, but none the less surely, diffusing its generous, kindly light over the most solitary clachans of the Highlands and the most remote islands of the far Hebrides; and probably the next generation will laugh

at many of the strange customs to which their worthy, if untutored, forefathers pinned their faith.

THE EXILE.

THE wide and dazzling pinions crossed The moor and glen before my gaze. What mighty wind, what hungry frost, Has driven to the inland ways An exile through the hapless days, The sea-bird, lone and lost?

The sea-bird, wheeling o'er the plain, Or dipping to the tideless mere, Gives forth again and yet again-Forlornly strange upon the ear, In faltering sea-notes sad and clear-Its longing and its pain.

O sea-bird! though so fair appear The rolling moors, the pastures wide-With here a sounding stream, and here The splendour of the mountain-side-You hunger for the rising tide, For far horizons clear.

The rising and the falling deep, The tumult of the driven spray, Round coasts where winds and waters sleep In haunted caverns dim and gray: You hear the voices far away-Voices that call and weep.

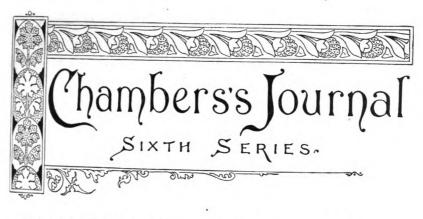

The glory of the lands have cast No spell to charm you to their rest. Strong be the tempest, fierce and fast, Shall seize and bear you on its breast Back to the wild and breaking crest, The tossing sea, at last!

What if the soul of man be blown O'er inland plains, bereft and lost; On faltering wings to soar alone, Flung from his far remembered coast, By some strange wind of fortune tossed, Some tempest all unknown?

How fair soe'er his fate befall, Far from these lands his heart is set; And restless sea-dreams still enthrall The soul whose pulse is thrilling yet, For spacious waters surge and fret Where sovereign voices call.

The secret hope he keeps entire Of high descent but half-divined, The spark of infinite desire That, fanned by some enchanted wind Through vast horizons of the mind, Flames to immortal fire.

Winds of the foam, give back once more The sea-bird to the ocean throng! Wind of the Breath of Life, restore The dreams that to the sea belong! O Winds of God, blow far and strong, And bear them to the shore! B. MAXTONE GRAHAM.

OLD ST PETER'S AND THE NEW ST PETER'S MUSEUM.

By Douglas Sladen.

AM able to announce on the authority of the most influential of the cardinals that the Pope intends to establish a St Peter's Museum like the Opera del Duomo at Florence and Sienna.

As the museum must consist chiefly of the remains of old St Peter's, I have been invited to recall all that is known of old St Peter's, and to sy something about the remains of it which are to be found in the crypt of the present church and elsewhere. The most important paintings of it are preserved in a little German capital, where a royal abless who was too infirm to make the pilgrimage to Rome was accorded the privilege of substituting visits to the church or convent embellished with these paintings. Various pictures of it, of course, erist in Rome, and there is a contemporary model of it preserved in the Vatican. But the chief ground we have to rely on for an idea of a museum of old St Peter's is the crypt of the present church. Until the present Pope's reign, the crypt of St Peter's was to the ordinary traveller a terra incogmia it was as difficult to see as the museum of the wealthy Torlonias, who, unlike the old Roman nobility, rigidly exclude the public from studyag their art-treasures. Leo XIII. for long would ther no one to visit it except by his personal emission. He believed that dynamitards wished a blow up St Peter's, though it is difficult to think but so holy a place would not be sacred even to a cuinal in search of advertisement; and any crimial though regardless of sacrilege, might be deterred by the superstition universally accredited that some threadous misfortune would happen to him who distanced the grave of St Peter. So firm is this bild that no attempt has ever been made to rethe to public view the glorious cross weighing one indeed and fifty pounds, of pure gold, which the Lapress Helena laid on the tomb sixteen centhis ago, and which Pope Clement VIII. (d. 1605) at all lying there when a portion of the roof

of the tomb fell in. Accompanied by Cardinals Bellarmin and Antoniano, he found that it bore the inscription, 'Constantinus Aug. et Helena Aug. hanc domum regalem (auro decorant quam) similifulgore coruscans aula circumdat.' He had at first the idea of clearing away the ruins and exposing the tomb, but was deterred, possibly by that superstition which is so universal at Rome that even if the Pope were to order the cross to be removed into the projected museum no Roman would take part in the work. Clement had the opening hurriedly closed and covered with a thick layer of masonry. This cross is the most valuable thing of its kind known to survive.

In Leo XIII.'s day the crypt could only be seen by torchlight, and it would have been easy for a miscreant to conceal himself in its dark recesses; but the Vatican authorities have now very wisely had it illuminated with electric light. Only—though proper persons are allowed to visit it—the regulations are so puzzling that few people ever achieve admission except under the wing of a high ecclesiastic or Mrs Pearde Beaufort, a persona grata at the Vatican, who lectures on the crypt.

The crypt of St Peter's is amazingly interesting, for the 'old grotte,' extending below St Peter's from the tomb to the entrance, are actually part of the original basilica of Constantine. You stand on the very pavement trodden by the feet of popes and kings and millions of the faithful for a thousand years. In it are preserved the grand old Gothic tombs of some of the greatest of the popes, and in it, fragrant with white roses laid on them by the adherents of the lost cause, are the tombs of the last three Stuart kings-James III., Charles III., and Henry IX.—unwieldy sarcophagi of painted plaster. These unhappy and unworthy princes rest here, and not beneath the elegant monument by Canova of an angel with tired wings, which George IV. had the good grace to erect to their memory on the first pier of the nave of St Peter's. When I say un-[All Rights Reserved.] DECEMBER 8, 1906.

worthy, I must record this in James III.'s honour, that had he seen fit to change his religion for the crown of England he would have reigned longer than any of our sovereigns, not excepting Queen Victoria, for he survived his father by more than sixty-four years. Not many in the history of the world have given up so much for their faith.

The 'old grotte' filling the space between the floor of old St Peter's and the present church will hardly let a tall man stand upright. Here are buried the great young Emperor Otho II. and such famous popes as Boniface VIII. (d. 1303), Hadrian IV. (d. 1159), Nicholas V. (d. 1455), Innocent III. (d. 1216), and Paul II. (d. 1471). The fine sarcophagi of Pius II. (Æneas Sylvius, the most lovable of the popes; d. 1464) and Alexander VI. (the least lovable; d. 1503) do not hold their bones; the latter never did. Hadrian IV., the only Englishman who ever grasped the keys of St Peter, lies in a mighty sarcophagus of Oriental granite. Paul II.—who had the finest tomb of all the Middle Ages, whose fragments, carved with incomparable grace by Mino da Fiesole, fill half the new grotte-lies in a plain sarcophagus with an inscription as close as a column of a newspaper; a very simple grave holds the first humanist, Nicholas V.; Otho lies in a plaster leviathan. Christina of Sweden, who gave up her crown to be converted, and Charlotte of Cyprus, who naïvely asked the Pope to make the conquering Mohammed II. disgorge her kingdom, lie under plain incised slabs. Only one woman not a queen rests in old St Peter's-Madame Agnes, the Colonna who married a Caetani.

The new grotte form the substructures of the dome, and are more in the nature of a museum than a cemetery. Most important in them are the frescoes of the old basilica and some of its glories, like the shrine of the Holy Lance. But there is a statue of St Peter older and more beautiful than the statue worshipped above. Its body was a Roman Consul, and its head was changed in the early days of Christianity. Near by is a beautiful inscription of Pope St Damasus-about the drainage, and the exquisite bas-reliefs from Nero's garden which were the inspiration of Mino da Fiesole, whose glorious sculptures, executed for the vast mausoleum of Paul II., fill, with the screen made by Matteo Pollaiuolo for the old confessio, half these new grotte. Mino never excelled his figure of Charity holding a chalice on Paul II.'s tomb. Matteo in his inspired moments approached Mino, in his uninspired moments was no better than Baroque. Beautiful, too, are the mosaics on Otho's tomb and the noble papal throne in which St Peter

What you can see of the tomb of St Peter in the crypt requires scant mention. You find nothing ancient, hardly anything medieval or worth remembering. It was inevitable that all its ancient features should be sacrificed to wealth and piety.

I must say no more about this rich museum of

old St Peter's. I must try to draw a picture of the basilica itself.

Like the Lateran, St Paul's Without the Walls, St Lorenzo, and St Agnese, it was one of the six basilicas erected by Constantine the Great. None of them have been suffered to continue in anything like their original state. Constantine (A.D. 324) made Christianity the official religion of the world, and his basilica lasted with ever-increasing splendour till after the Reformation. Eighty-six of the two hundred and seventy popes were buried in it, and one of them, Paul II., had the most glorious tomb in all Italy. I can hardly conceive a supreme artist like Bramante destroying it, but he did. He deserves his nickname of 'the ruiner.'

The church at Rome which gives us the best idea of old St Peter's would be San Clemente, if the Irish College kept the atrium open; but San Clemente, for all its beauty and immense antiquity, is a small affair. We can understand old St Peter's better by comparing it to the basilica of St Ambrogio at Milan. It was approached through a superb atrium (forecourt), which opened into a huge basilica consisting of a lofty nave terminating in an apse, four aisles, and a transept which projected slightly beyond the aisles and divided the nave from its apse. This transept was probably raised above the level of the nave, like the transept of the great friars' church of Santa Croce at Florence, and made the church a T-shape, not cruciform like our cathedrals. The nave was enormously high-one hundred and twenty-five feet-and lighted with a clerestory above the architrave, which rested on a hundred monolith columns of the most precious marbles taken from heathen temples. A double aisle on each side was divided by a row of columns; the roofs were of wood. The interior was a glory of mosaics and marbles, and in the preciousness of its materials, the flash of gold and mellowness of colour, must have rivalled the two gems of Christendom-St Mark's at Venice and the Royal Chapel of Palermo. Its facade was decorated with a mosaic representing the Lamb of God between animals symbolising the Evangelists; and at each end of its gable was a huge bronze peacock, the emblem of immortality. According to Klaczko, the atrium was filled with a profusion of flowers and trees-palms, cypresses, olives, and rosetrees-and ornamented on all sides with a handsome Corinthian portico. At the right of the church door rose a slender and lofty bell-tower of the age of Charlemagne, with a queer little pointed steeple; but its great feature was the famous cantharus, or fountain of lustration, in the centre. 'It was a magnificent fountain, surrounded by eight porphyry columns, and protected by a gilded roof with a great display of dolphins, peacocks, and dragons thereon. A colossal pine-cone in bronze, reputed to have been brought from Hadrian's mausoleum, formed the core of the fountain. Dante, to give a measure of the formidable Nimrod, the founder of Babylon, whom he encounters in the lowest circle of the

Iniemo, says that the giant's head appeared to him 'long and large as the pine-cone of St Peter's in Rome, and the rest of him to correspond.' This pine-cone and the peacocks are still preserved in the Garden of the Pigna, attached to the sculpture-galleries of the Vatican.

The atrium and narthez were used for those who were not full members of the Church, catechumens, penients, and others; the fountain was used for abintions, like the fountains in the courtyards of Tarkish meaques and Japanese temples. The nave and sizes were occupied at services by the laity who were full members of the Church, the raised transpt by the clergy and persons of distinction; the presbyters of the Church sat on a circular beach which ran round the wall of the apse, half to the right and half to the left of the bishop's throse, which occupied the exact centre, as it still does in more than one of the Roman basilicas.

The confessio, containing the tomb of the martyr (graerally sunk several feet below the level of the foor), here, as in St Giorgio in Velabro and other primitive basilicas at Rome, stood just in front of the spe. This is important, because the tomb of St Peter is, with the exception of the floor of the basica of Constantine, the only part of old St Peter's which exists undisturbed.

One must not imagine that the ninety-two superb gold lamps which burn in front of the burial-place of Peter, the rock whereon the Church was founded, or the glittering Oriental alabaster to be seen today, go back to the times of the old basilica, much less of Constantine; but the grille in front of the tomb, though not original, is of respectable uniquity, for it was put up by the last great pope, inscent III. (d. 1216), who imposed his tyrannical not only on our King John but on the mighty Palip Augustus of France, whom he separated hom his lovely and beloved Agnes of Méran; so re the Fenestella confessionis. Of the actual tomb d St Peter one can see nothing. It is more than the concealed since Clement VIII. had it walled or. It occupies approximately the spot beneath

The word basilica is only properly applied to the ucent Roman churches whose distinguishing mark the altar in the centre of the church, at which te clebrant stands facing the people, like the And altar in St Peter's. As a consequence, asing have their high alters at the west end. is the Middle Ages, Klaczko tells us, people were are very of endowing this tomb and alter with our maginable splendour of gold and gems; the tracrous spoliations they suffered from Saracen to even Christian invaders could not discourage is generous piety of the faithful. Narratives of keriod never cease dilating upon the immense tasares gathered there—tabernacles, ciboria, crosses, nes andelabra, cherubs, and statues. There was t pophyty belustrade surmounted by alabaster stams with an architrave of silver, decorated with win an architrave of silver, decorated with ven or so ventures, feur-de-lis, and translucent vases; in the had left its outline.

centre there was an arcade surmounted by a golden Christ attended by tall silver angels. The alabaster columns were spiral, and were surrounded by carved vine-sprays. Tradition said they came from the Temple of Solomon. It was these, says Klaczko, which gave Bernini the idea of his frightful baldacchino. He believes that Giulio Romano's fresco in the Vatican stanze, known as the Donation of Constantine, is a representation of the old St Peter's. 'The scene takes place in the old basilica. In the background, in front of the high altar, there are visible the twisted columns, standing upon a stylobate and supporting an architrave from which are suspended lamps. Is the reproduction exact at every point? This I should not dare to affirm; but it is the work of Giulio Romano and his companions; it dates from a time when the chancel was yet standing.' Raphael evidently had this balustrade in his mind in his tapestry of the Beautiful Gate of the Temple at Jerusalem.

Old St Peter's consisted then of a great courtyard, with a splendid fountain in its centre surrounded by a rich mass of vegetation as sad as cypresses and as gay as roses for its cloister garth, and with the cloister itself, like the narthex, filled with the tombs of ancient popes and kings. More than fourscore popes were buried in Sylvester's basilica, and it was only after the lapse of centuries that they were allowed to crowd into the church. The early Christians considered it irreverent to put tombs in the churches themselves. St Peter was buried in the ancient Roman fashion, alongside of one of the great roads leading out of Rome, the Via Cornelia, selected as the scene of his martyrdom. The façades of both atrium and church glittered with mosaics, like the façade of Santa Maria in Trastevere to-day. Against the exterior there was an applomeration of convents, minor churches, hospitals, and houses, clinging to it like barnacles to a rock submerged at high-tide. The whole stood on a lofty terrace approached by steps and backed by the towered and battlemented castle of the popes.

Inside the church the number of mosaics is inconceivable to those who have not seen Venice and Palermo, especially noteworthy, as we know from the paintings preserved of them in the crypt of St Peter's, being those of the Holy Lance. The mosaics of the great triumphal arch went back to Constantine, who placed upon it the inscription which recited the supremacy of St Peter. Five gates gave access to the nave and the four aisles: the Porta Judicii, by which funeral processions entered; the Porta Argentea, which was covered with silver plates; the Porta Sancta, only opened for a jubilee; the Porta Romana, for the women; and the Porta Ravenniana, for the inhabitants of Trastevere, whose ancestors were a garrison sent from Ravenna by the Exarch. The Porta Guidonea led to the oratory which contained the precious veil of St Veronica on which our Lord's dead face

Old St Peter's, with its atrium, was as long as the great church of to-day, and its width was not greatly less. It was venerable beyond all other churches in the world not only for its hoary architecture, majestic with the velvet touch of a thousand years, and its avenues of tombs of the great of the earth in mosaics and marbles; it was rich beyond all other churches in relics of martyrs and apostles-yea, even of the Saviour Himselfand the gold and silver offerings of the loyal and devout, which had accumulated in the centuries since the last sack of Rome. It was richest in sentiment and association, for it had been Christianity's Holy of Holies, where the successors of St Peter had been enthroned and had issued their messages to the world from the time, almost from the hour, that Constantine made Christianity the religion of the Empire over which he ruled. In it Gregory the Great (d. 604) was borne to the tomb inscribed with the conversion of England; in it Boniface VIII. (d. 1303)—who, though bound on a cross between two thieves by the Colonna, had survived with unbeaten pride-was laid in the incomparable altar-tomb by Arnolfo de Lapo which is still the glory of the crypt; and in it Innocent III. (d. 1216), while smiting Europe with a rod of iron, found time to leave noble monuments in bronze and mosaic.

Old St Peter's was the outward and visible sign of the Apostolic Succession. Here people could tread the stones trodden by the Christians in the day of Constantine, who exulted in the fulfilment of the prophecy that the earth should be the Lord's. It looked as if it had not been built by hands but moulded by time. The holiness which had accumulated in this building exceeded even the holiness of the Temple at Jerusalem, so many years, so many sacrifices, so many memories, so many remains of what was most sacred or most famous, had been garnered into it. It is hard to believe that any Christian man would have dared to lay his hand on the church where nearly a hundred of the successors of St Peter had been laid to rest till the last trump; but in the fifteenth century, the melting-pot of the Middle Ages, it began to be whispered that the old church was worn out and must come down. The best that can be said for those who repeated the whisper is that Nicholas V. (d. 1455), the founder of archæology, the first of all the popes to love and try to save the treasures of antiquity of which they were the ignorant heirs, believed it, and began to build a new church round the old. He broke off his work. Was it because his heart failed him? Julius II. (d. 1513) took up the work. To him nothing was sacred but the prestige of the popes. He was, like Nero, consumed with a desire to rebuild Rome on an unprecedented scale; and, by a curious coincidence, St Peter's stands on the site of the Gardens and Circus of Nero. Nero was accused of burning Rome to secure a site for his building operations. Julius II. did not go so far as that; he only broke up the church which had been the cradle of Christendom for a thousand years in such indecent haste that the tombs of eighty-six of his predecessors were reduced to rubbish-heaps. He could not even spare the masterpiece of Mino da Fiesole, the mausoleum of

With the destruction of old St Peter's the misfortunes predicted by the ancient superstition for any one who disturbed the tomb of St Peter overtook the papacy. Old St Peter's was the tabernacle of all Christendom, the present church is only the tabernacle of Roman Catholicism.

THE LORD OF THE MANOR.

CHAPTER III.

ERHAPS you will wonder why I tell you this, Warrener said finally. He had been speaking for a long time; there was a fine glow of enthusiasm on his brown

face. 'In the first place, I was pretty sure that you would be in sympathy with my idea. You did not expect anything so poetic from a business man?'

'Why not?' May asked. The glow on Warrener's face was reflected on her own. 'Two of the most delightful and fanciful books I know are written by business men. Take The Golden Age, for instance. And I suppose there is romance in business?'

Warrener laughed. He seemed to be very pleased with himself.

'Of course,' he said. 'Take my own career, for instance. We manufacture our commercial necessity

in a village. That was my idea—the ideal working man in the ideal village! That was laughed at as a dream. But there it is-over two thousand workmen housed in model cottages covered with creepers-roomy, airy, efficient! We even have a theatre. We give pastoral plays in the park. And my people are getting enthusiastic as to Shakespeare! All that from prosaic soap! Oh, I can assure you there is much latent poetry in commerce. It was my education in this direction that first gave me my inspiration as to the common. But it is to remain a secret for the present. It is very fortunate for everybody that I am in time to avert the plans of those hotel people.'

'My father would never have consented,' May

'Probably not. But, you see, the matter is out of his hands. I am afraid that I am mainly

repossible for this Hampden-like attitude of Samuel Craggs. I had quite forgotten the place of my birth. I had hardly visited it since I was a boy. Pardon my egotism; but it is necessary to tell you these things. My early memories are not pleasant; there is too much sordid poverty in them. Do you know that at one time my inher wanted to marry your Aunt Gertrude?

'I only learnt the fact to-day,' May explained. 'That was a real romance for you! My people were as poor-well, as you are. It was the most dreadful kind of poverty. My father had the apportunity of going into business, and he took it. It was a shocking thing, of course, degrading and all that. And your father had no alternative. He was conscientious according to his lights. But he runed a very pretty and tender love-story. The tragic side of the medal lay in the fact that my lather was not in the least fitted for business. It was only a long struggle against the black wolf of ankruptcy. I learnt the lesson that my father hild to grasp. I threw myself heart and soul into the concern; I became a master of detail. And to day I have two thousand of the happiest employés n England and a fortune that is sweet and honest. Then I met you and your sister in London, and I iell in love with the daughter of my father's old head And when the time comes I am going to make Angela my wife."

There was a clear ring in the last part of the spech, a challenge in the flung-back head that May did not fall to notice. Really, Angela was a very intuate girl if she had only sense to see it. Yet lagels had been coldly polite to this highly scoomful trader; she had tolerated the emollient for the sake of the old family friendship. Angela squit as proud and foolish as her father. Warrener flung back his head and laughed at his wan theer conceit.

There, he said, 'I have made my confession; and I am not in the least ashamed, knowing what he sap has done. It has given my mother her all in the south of France, the only air that she as breathe; it has given my erstwhile little brother that Harrow and Cambridge can afford; and here are other things. Is that not better than the say contemplation of the family dignity and a set a supply the same of the same of

Mothing of the kind, sir.' May laughed. 'I like at all the better for it. But you have not told laded I haded I.

indeed I have. I have told you that I am sage to marry your asset. And I told you sometime of the romance of Aunt Gertrude. And the I discovered that Angela was the one girl see, I began to ask questions. Oh, I know all the industrial about the struggle to lay the ghost of is family pride, about the poor people at the instal I came down here and made friends in Sam Cragga. I found the emollient of the roses possible assistance then. The hotel pros-

pect I heard of in London. Then the Great Inspiration came on me like a flash. We could dispense with the hotel programme, which is by no means a pretty one. I bring back prosperity to the family at the same time, and that without spoiling the lovely spot or interfering with the seclusion of anybody. I may admit that Craggs gave me the first germ idea. For a long time past he has been pretty sure that your father would not listen to my suggestion. And yet I think that I have convinced you that here is a veritable goldmine.'

May nodded thoughtfully. She had been absolutely convinced. She was also absolutely convinced that her father would have nothing whatever to do with it. Still, if Craggs was right, happily Mr Castlerayne would not be in a position to interfere.

'Let us go and discuss it with Craggs,' Warrener suggested. 'I will tell him that you have come over to the side of the angels. He is very fond of you.'

On the crest of the hill, beyond the belt of pines, the hospital lay, a series of stone buildings with a chapel in the centre. The place was quite two centuries old; the stone part was ruddy and violet and saffron with the beating of bygone storms; on the green in front two good old cedars slanted in from the direction of the sea. There were hammerediron railings in front, with the device of the Castleraynes worked into them. There was something purely feudal about the idea of these pensioners on the bounty of the head of the clan. It would have been much purer still had the income been a regular one and not a precarious dripping of doles from the overlord, who was little better than a pauper himself.

Under one of the slanting cedars, guarded from the sunshine, sat an old man reading a big volume by the aid of a pair of round iron-rimmed spectacles. His face was grooved and knotted, filled with crossed lines like the rind of a melon. He had bushy eyebrows and a chin of aggressive obstinacy. His hands were drawn and knotted by chronic rheumatism. He put aside his book with a palpable sigh as he saw his visitors.

'Well, Craggs,' Warrener said cheerfully, 'I have brought Miss May to see you—brought another convert to the Great Conspiracy!'

'She always had the brains of the family, did Miss May,' Craggs said bluntly. 'Not that I'm going to say a word against Miss Gertrude. Spending her little fortune, she is, on we folks here, and makes me downright mad to think on. But these poor creatures here as would never go to the House, nor should they be asked to, seeing as the place rightly belongs to we. It was all right so long as the plumbago lasted; it was not so bad till our mineral spring gave out; but latterly it's the bread of charity, and right nasty stuff it is. But I'm going to stop all that.'

The speaker brought his knotted hands together

with a snap. The village cobbler seemed to be terribly in earnest. The others let him run on for the time.

'I found things out,' he said. 'This common belongs to us; and it comes hard if we can't get a living out of it and be independent of everybody. Time was when every rood of ground maintained its man. That's Goldsmith, as wrote the Deserted Village—a proper Radical he were, surely. And when I found out as every rood here belonged to us, I began to rack my brains for a way to turn it to account. Not as I liked the hotel idea; I liked it so little that I said nothing further, as the squire would have to put a stop to that. And then Mr Warrener here comes along with a good notion as tickles me dreadfully. I don't know whether he said anything to you about it, miss.'

'Mr Warrener has been so good as to take me into his confidence.' May smiled. 'I regard the scheme as a distinct inspiration. I wonder it has not been thought of before. But you are going to

be the man to bring it all about, Craggs.'

The old cobbler flushed with pride. The gray eyes twinkled under the bushy brows. Given scope and opportunity, Craggs would have been a great reformer, he would have been a good parliamentary debater; he had a rugged eloquence of his own. Strange that so great a Radical should have been in so uncongenial a soil. Yet he was conservative enough to dislike the idea of anything like constitutional change in the environment of his birth.

'I love the old place,' he said. 'For seventy years I've lived here. I buried my wife and my two children back yonder; and I came to the hospital feeling as I had earned my rest, not to eat the bread of charity. It lies too cold and sour in the stomach for me. What I want to see arising from the place is income; the unearned increment does not appeal to me. And yet I don't want to see the place cut up and spoilt. This is a place made by God Almighty for people to breathe the

fresh air and be grateful for the gift of life—a kind of sanatorium made natural. And Mr Warrener has found the way to do it, which comes of education and a proper use of the brain as Providence has given him.'

'That is very nice of you,' Warrener said gently.
'Your dream is pretty certain to come true, Craggs, provided that you are right as to your reading of the charter. According to your argument, the common belongs to the hospitallers to do as they

please with.'

'Not to sell it,' Craggs remarked. 'Let's be fair. The chief rights belong to the Lord of the Manor, which is Mr Castlerayne and his heirs for ever; but to work the place to the best advantage and to apply it to any legitimate purpose by means of which we can derive benefits by way of income. That's what my lawyers in Hardborough say, and they are prepared to fight the matter out for me. And the squire will fight us for certain. I've got five hundred pounds to go on with.'

Craggs paused and looked uncomfortable under the close gaze of May Castlerayne. He had a shrewd idea that she knew where the five hundred pounds

had come from.

'It won't be wasted, miss,' he said almost penitently. 'Like bread cast upon the waters, it will come back after many days—ay, and not so many days either., That money came from an angel, if ever there was one, and every coin of it is blessed. And who's the squire that he should stand like a stone in the path of progress?'

The latter question was flung like a missile at the head of May. She had no answer to the challenge.

She smiled in a pleased kind of way.

'When Craggs falls back on that frame of mind I always fear him,' she said. 'Let us go back to the house, Mr Warrener; you will come and have a cup of tea. My father would never forgive me if I allowed you to go without something, even if it is only a cup of tea.'

(To be continued.)

THE DIET OF THE FUTURE.

By Josiah Oldfield, M.D.

HE diet-problem of the human race is a very complex one, and it cannot be solved by thumb and rule, as if men were the furnaces of a steam-engine into which fuel is shovelled by the ton and calories

are produced to order. Climate, occupation, habit, heredity, are all disturbing factors, and the personal equation is perhaps the most variable of all.

None the less, now, at the beginning of the twentieth century, we have accumulated such a wealth of experience from nations who have risen and fallen, who have fought and endured, who have rested and grown enervated, who have persisted like the Jews through countless decimations, or who have disappeared like the Maories and Red Indians in the presence of advancing aliens, that we can gather some broad lines on which to begin the foundation of a picture portraying the ideal feeding of the race of men.

I am always struck by one great fact in connection with the evolution of the dietary of the human race which separates men off from all other animals. I mean sentiment! Call it Art, call it Culture, call it Romance, call it what you will, the fact remains that as men develop there is a sentiment which becomes more and more potent side by side with their development. A cat or

og vill nose out a bit of garbage from amidst the most unsavoury surroundings, and enjoy it with as much gusto as if it had been served on a Sèvres china dish. No historian suggests that Caligula's horse showed any appreciation of his oats being gilded. A pig will enjoy his antrent acorn quite as much whether he finds it at the bottom of a tub of sour wash or picks it up from among those crisp, clean autumn leaves which carpet the forest and are the most perfect of primeval platters.

There are, therefore, two great questions that have to be considered in thinking out the diet of humankind. There is the physiological problem of what will nourish the body-cells, and there is the interlinked mental problems of what will satisfy the aesthetic and artistic side of their nature. Most writers on diet ignore this latter problem, and are quite satisfied to talk about tables of nutrition and percentages of nitrogen and carbon as if these comprehended the diet-question. Those, however, who have studied human beings as living personalities and not as cog-wheels have discovered that sentiment plays a most important part in det, and its influence increases and is increasing pur passe with the evolution of higher art and higher ethics.

We of the medical profession are constantly iced with sentiment set on edge, and we are often tared to the uttermost to harmonise the physiological food which we want to prescribe and the sentimental objection to it which the patient most acutely manifests. There is the common illustration, which every one meets a broad times in a lifetime, of the girl whose fractions need much fat, but whose stomach rebels it he very thought of fat meat. The mother ires persussion and entreaty and threats and pealite, but nothing can overcome the artistic that in the girl's development which makes her viols at the bare idea of putting the fat piece of the stream of the sentence of the sentence

But since it is fat that is needed, and not fat and the antagonism that exists between physiooccal needs and artistic sentiment is got over by are who are endowed with sufficient commonene by obtaining the fat from a non-meaty same! Again and again I have said to a patient, Now, what you want is more fat. You must take jean of fat, 'Oh, but, doctor,' is so often the tower, 'I can't bear fat.' 'Don't you like butter?' hely, 'Oh yes, I like butter.' 'Well, did you the me any lean butter?' is my rejoinder. 'Oh to; but I thought you meant fat meat.' When erpain that cream, or butter, or cream-cheese, a good Camembert or Salop or Cheddar cheese, a pinekernels, or almonds, or olives, or Brazil the or a host of other things, will supply the at which is needed quite as well as fat meat, ind of pleased relief replaces the air of disgust, and a keen interest in securing the physiological dense that are required replaces that attitude of hostility which had been previously evoked by the prescription of 'more fat.'

This illustration may well form the basis of my apologia for advising the adoption of a fruitarian dietary by all who are so sufficiently developed on the artistic plane as to be conscious of a sense of repulsion when they are bidden to take of the carcass of a cow or a sheep or a pig, and to feed upon it.

There is no doubt about it, hide it as one may, there is something in the very idea of eating a dead body which is repulsive to the artistic man and woman, and which is attractive to the hysena and the tiger. The poet who recognised that there was a tiger-side to man recognised, too, that it was the lower and the evanescent and the transitional, and that there was also an angel-strain in the human race, and that this is the higher and the progressive and the permanent. The tendency of an advancing evolution is to war out the ferocity of the tiger and the vacuous imitativeness of the ape, and let the creative grace of the angel live.

This law holds as good of food as it does of all other fields of human activity. We are, therefore, perforce driven to face the problem of evolution in dietary, and to ask ourselves in what direction and on what lines this evolution tends. To me, the development of humaneness and sesthetics necessarily makes for an increasing bias towards a humane and æsthetic dietary. Whether we search in the majestic language of the prophets, or in the sweet melodies of great poets, or in the weighty thoughts of meditating philosophers, or in the fairy visions of romancers, or whether we turn to the brush-pictures of inspired painters, or to the imperishable mementoes of sculptors' dreams, we find that the aspiration of the upward-gazing man is towards the simpler life in food, and towards a bloodless, guiltless feast, and towards the products of the orchard and the harvest-field, and the vineyard and the olive-yard, and away from the shambles and the stockyards and the gore-stained slaughter-dens.

My opinion, after a quarter of a century's study of diet, is that the future lies with the fruitarian, and that the practice of flesh-eating will become more and more relegated to the lower classes and to the unimaginative-minded.

If, then, the inner voice of art calls towards the bloodless feast, it is necessary for science to determine whether the call can be responded to without physical injury. It is essential that the fathers and mothers of the next generation, to whom are entrusted the treasures and glories that their ancestors have won, should themselves be built up sound in limb and tireless in vitality.

Is fruitarianism sufficient for all this?

One may go to the lands of the Orient or the Occident, to the island-home of Japanese heroes or the great continent of Indian ascetics, to the sunscorched sands of Egypt or the wind-swept steppes of Tartary, to the mild Finns or the fiery Scots,

to the athletic gladiators training to fight for their lives in the gory Colosseum or to the seasoned veterans of Cæsar's army campaigning in the rigorous climate of Gaul; from all countries and under all conditions of great stress and toil the same experience is obtainable: that it is from the peasantry of the land, whose diet is very largely or almost wholly obtained from the vegetable kingdom, that the thews and sinews and dogged endurance of the race is obtained.

Meat may be an occasional savoury addition to the diet, eaten as a luxury; but no one with an eye to proportion could claim for the infrequently eaten morsel any value from a staminal point of view. I never forget those hardy old fighters of Cæsar threatening to mutiny because he fed them on mutton. 'Give us corn,' they clamoured—'corn, the food of men. How can you expect soldiers to fight on soft mutton?'

Scotchmen have built up their hardy physique, their untiring determination, their intellectual supremacy, upon a frugal fare of oatcake and kalebrose; and it is only too evident a fact that the attractions of the Saxon beef are having a deleterious and not a beneficial effect upon the Scottish constitution to-day. The largely mixed feeding Scot of to-day is not the staminal equal of the oat-fed Scot of the past.

The Lady Margaret Fruitarian Hospital at Bromley in Kent is a striking testimony to the physiological value of the fruitarian dietary for restoring weakly and debilitated and diseased conditions. It is found there that medical and surgical and midwifery cases do so excellently well that it has now become the routine practice, as the result of experience, to put all meat-eating patients who are admitted for serious surgical operations upon a fruitarian dietary for three weeks before operating.

The classical experiment undertaken this year by the Daily Express to prove that any ordinary man would improve by being put on a spare fruitarian dietary not costing more than fourpence per day was so conclusive under the most rigid conditions that it cannot now be gainsaid that in this climate, and under severe conditions of physical stress, men of any age can be suddenly and immediately put upon a strict, frugal fruitarian dietary with the result that they will improve in tone, weight, spirits, mental capacity, and general fitness.

I, therefore, have come to the conclusion that the future of the best races developing along lines of physical capacity and artistic evolution will tend more and more to conform to a carefully selected fruitarian dietary, and that flesh-eating will become a disappearing habit among them, and will be more and more relegated to the lower classes.

What, then, is the first step in the transition? It is the disuse of flesh food in toto. For a considerable number of people the objections to the use of fish are much less potent, and I contemplate, therefore, the use of clean fish for food being per-

petuated longer than the use of flesh food. By the greater proportion of thoughtful and artistic people, however, fish will also be abjured, and a stricter fruitarian dietary at once adopted.

For recipes and methods of cookery and general and particular advice as to the selection of seasonable foods and dietaries suitable for different constitutions recourse should be had to the various cookery-books and guides issued by the Fruitarian Society (New Kent Road, S.E.) and by the Order of the Golden Age (Paignton, South Devon).

The food of fruitarians is selected from the great class of fruits and salads and storage treasures prepared by the animal creation. The following are fairly typical of their class, and are merely specimens of foods of which the varieties are countless and can be modified and selected to suit every condition and age and constitution and climate and occupation:

The fruits of trees—for example, apples, oranges, plums, bananas; the fruits of bushes-for example, grapes, gooseberries, currants; the fruits of plants for example, tomatoes, melons, cucumbers, strawberries, bilberries; the root-fruits of vegetables -for example, potatoes, pea-nuts; the fruits of grasses-for example, wheat, rice, maize, oats; the fruits of leguminose-for example, beans, peas, lentils; the fruits of the nut-tribe-for example, walnuts, chestnuts, coco-nuts, butter-nuts, almonds, pine-kernels; the treasure-troves of animal and animal cell-activity - for example, milk, butter, eggs, cheese, honey; the treasure-trove of vegetable cell-activity-for example, carrots, arrowroot, parsnips; together with salads-for example, watercress, endive, lettuce, which are eaten by every animal at one time or another.

By the scientific combination of mastication, digestion, cooking, malting, and pulverisation, every one of these foods can be made to yield a food ready for absorption and specially well adapted for the nutrition of the human body, together with constituents most valuable for dissolving and eliminating waste products from the system.

Nuts and cheese, which are two very indigestible foods when eaten in the ordinary way at the close of a meaty meal, become readily assimilable and blandly digestible when nuts are put through an Orange's nut-mill or malted (as in the preparation of meatose), or when cheese is finely pulverised or cooked with a sufficiency of milk or partly predigested (as in the preparation of Greenfield's cheese), or when soft goat-milk cheeses are used (like fresh Camembert), or when fresh 'lime-cheese' is made at home as required.

The solution of the problems of dietary is so fascinating, and the possibilities that lie before the human race as the result of pioneer dietetics so gigantic, that I sometimes wonder how any sane man can be content to say, 'Roast-beef and plumpudding were good enough for my father, and so they're good enough for me.'

From my own observations of the changes and

modifications that can be made in a man by a few months' dieting, I am satisfied that many of the problems of crime and insanity and intemperance and hoggishness could be largely solved if one could control the dieting of the race for a hundred years.

The diet of the people is a national problem of the gravest importance and of the most far-reaching results, and I am of opinion that the welfare of the race lies along the tendency towards a fruitarian

APART

CHAPTER II.

VER the quivering floor-fired by the intoxicating crash of twenty instruments, by the perfumes, by the beauty, by the very spirit of Pan; pausing breathless, resuming to the

challenge of a glance—there they danced till the stars should be dead and the sarrows twittering. The room was packed; people stood four-deep against each wall, and in the midst the dancers were like the bubbles in a fountain. It was hot as an Indian afternoon, and the air no pure than deep down an ill-ventilated mine, yet on could see scarcely an eye that did not shine with pleasure.

'Am I in Bedlam or the neolithic age?' said farer to himself as he stood in that crowd untouched by its thrill, unmoved by any impulse to do more than accomplish his purpose and escape.

Such an one thrust suddenly into the heart of a ball feels something like a sober man in a drunken red Yet when Leonard caught sight of the face he coked for, some emotion did certainly show in his quet eye and remained there, rather heightening than vaning while his gaze followed it through the throng Swiftly turning, that which he watched was at one instant a fair face, at the next a pile of surt hair flashing with diamonds, and then a face sain. By glimpses he could see now the whole graceful figure of a girl (for she looked little nore) dressed in black, with sparkling jet and a dean of scarlet flowers, and again only a white soulder. How gracefully she moved! he thought; by lithely, and with what a superb abandon, and nt how like a queen! The man she danced with -ull, fair, and sunburnt—set her off to a miracle. is worth coming only to watch them! On and a they went, in and out through the densest of the cord without check or scarcely even a slackening; wither ever tiring, and she always with a slight all lighting the fairest face (the watcher was say to swear) in all England.

The intoxicating music died away, the mesmeras notion ceased, the dancers slowly struggled orange the doors, and the light passed out of lungs eye. The thought hit him on the heart that the had danced his friend's happiness away. Involity, thy name is woman!' said he.

at length he reached her side.

Legard! Is it possible?' she cried, throwing as a smile over that white shoulder. 'What, stadly coming to dance with me! Oh, something important? Well, keep me in sight; I'll listen if you're importunate enough.'

But it was not till she had danced through two more waltzes that he found his chance and led her out of the densest crowd to a seat a little apart.

'Be quick, my dear Leonard!' she said. 'Get it over and let me dance! Some one to-night gave me only three more seasons before I should turn blasé. I have no time to waste, you see !'

He looked at her in fresh wonder. She had spoken with her bright, restless eyes turned full upon him; but now they were dancing to and fro upon the crowd that moved before them, and she seemed intent only upon watching that panorama. A smile sat continually upon her lips, sometimes tempered for an instant by a little half-humorous frown that seemed called up by nothing but a passing thought, and then approaching a laugh in its brightness. Were these things all she cared for in the world? he wondered. The fascination of watching her tempted him to procrastinate.

'Who gave you three seasons?' he asked.

'Oh, only one of our hereditary legislators; no one wiser than that. But he is right ridiculously often. A man who never thinks has a most unfair advantage; he grows as clever as a woman. Don't you think so?

'Perhaps.

And there he is looking for me again! I have an intuition it is for me from something in the way his brow is wrinkled-or his coat, I don't know which. Make haste, Leonard, and tell your tiresome news.'

'Are you sure my news will be tiresome?' 'Positive!'

He stroked his beard indecisively, and then hesitatingly said, 'I have come with a message from Ralph.

She turned and stared at him.

'From Ralph! Why on earth couldn't he come himself? Is he ill?

There was a note of anxiety in her voice that a little encouraged him.

'In mind he is,' he answered gravely.

The anxiety vanished, and she cried lightly again, 'I recognise his delicate touch. For fear of disturbing me by the announcement that my account is horridly overdrawn, he sends you with the news! What a man he is! Is that it?'

'Not quite.'

He was tugging at his beard now, and at last

abruptly he exclaimed, 'I don't know how to tell you. I'd better read a passage from his letter.'

'His letter?'

'In case I couldn't meet him to-night he wrote me a letter. It explains why he is leaving you.'

Her eyes opened wide.

'Why he is leaving? Where is he going?'

'To Ireland.'

'To that fearful unpronounceable place of his?'

'Yes.'

'He has always loathed the thought of it! Why, in Heaven's name, is he going there?'

'This is what he says: "See Esther and give her any version you think advisable. I dare not trust myself to write to her, much less to see her. I might say something that might conceivably lead to a scene; and at least we have had no scenes yet. Either she might understand me and turn angry, or misunderstand me, when I might. I have been in love with her, you see."'

The colour rose to Esther's face, crimsoning her

'Been in love!' she cried. 'Then-then he is tired of me, and so Oh!'

Believe me, it isn't that! He only meansthat-that'-

What does he mean?' she interrupted.

'I think he means that you and he have gradually drifted apart.'

'And to bring us together he runs away! What a happy inspiration!'

Her eyes blazed with a flame of astonished, contemptuous indignation; the heavings of her breast followed one upon the other at a gallop; but she said nothing more. Gradually she grew calmer; her gaze became absent rather than angry, and at last she murmured, 'So that is his cure for it!'

Leonard stared at her.

'Did you know how-how you were drifting?' She returned his stare with interest.

'Does Ralph actually suppose I didn't?'

'He never dreamt you noticed it.'

'Noticed it!' she cried in a despair that yet had something comic in it. 'Oh, oh, oh!-and they allow men to go loose among the animals!'

He began to wish that this delicate mission had been entrusted to another of Ralph's friends.

'Do you actually think it possible that I never noticed the slow extinction of our first deep intimacy, the gradual return of Ralph to his old interests and companions, the dying out one by one of those wonderful moments that make marriagewell, that just make it? Did Ralph suppose I was more stupid than his dog? It would have felt such a change. Oh Leonard, you are as discerning as a pair of policemen!'

'But, my dear Esther,' he protested, flushing a little, 'if you never said anything, how could you

suppose he guessed your feelings?

What did he say? And yet I didn't have to guess—I knew everything. Her face darkened and her voice grew vehement. 'He was too |

polite to be honest, too considerate to treat me as a woman of sense, too fastidious to risk an escape of human nature for five blessed minutes -for they would have been blessed! And I was too young at first to show him the way; and then I started drifting, just as he did. And now he tactfully sends a friend to break the news that he is deserting me!'

But he wants you to go with him,' he said

eagerly.

When does he leave?

His face fell.

'To-night,' he stammered.

She laughed; but it was not a merry laugh to

'You mean that he wants me to run after him! No, thank you, Leonard. I'll go on dancing. It will keep up the jest better.'

He looked at her gravely.

'You are willing to return to-night-and find him gone?'

'Don't try to be pathetic, Leonard. I choose to treat it as a joke, and nobody shall prevent me.

'As a joke, Esther?'

'What is our life-Ralph's and mine-but a delicate joke—a piece of polished humour? We have neither of us anything to do but amuse ourselves; and we really don't need each other's help to do that. The idea of treating such a marriage seriously is absurd. In fact, we have so little real use for one another that I begin to think Ralph is right after all. Only, he ought to have come and told me himself.'

For an instant her voice had become serious again, and he was emboldened by this to try that

vein once more himself.

'It was out of consideration for you, remember.' She laughed the same mirthless laugh.

'It was out of consideration for two delicate plants that might have shed a petal if there had been a breath of wind! And here's my next partner. Good-night, Leonard, and thank you.'

She gave him a touch of the hand and a quick, friendly smile, and was off on the lightest foot in the room. For hours after he had left, that charming figure danced tireless through every waltz. Night had become morning and the London stars were fading from the day-sky when Esther Delane, her eyes brighter than a constellation of them, drove musing home to rest at last.

CHAPTER III.

STHER softly closed the front door behind her, and the lustre left her eyes. The hall was filled with the ghostly light of dawn, the house so silent that the twittering

of sparrows in the square sounded as though the fowls of the air inhabited her mansion with her. She felt like a visitor to some deserted Indian

palace where apes and cockatoos have usurped the place of man. Her husband was gone; the shell of their home stood chilly to the morning; and Esther, a she moved through its emptiness, trembled. At the stairfoot she stopped to listen to the insistent ticking of a clock, and to her apprehensive fancy each tick-tack seemed to ask, 'Whose fault?whose fault ?-- whose fault ?'

Slowly, with soft rustle and frequent pause, she mounted step by step. Then of a sudden she stopped altogether and leaned upon the wall, her eyes wide open, her lips parted. For out of the half-opened door of Ralph's study streamed the faint glow of lamplight, still just a little brighter than the shadowy dawn. Had he left the lamp burning to rebuke her with memories of other aights? An impulse begot of the silence prompted her to steal more softly and slowly yet till her hand was on the door, and then to push it very gradually so that, perhaps, she might deceive herself with iancies the longer.

No need to fancy further! For that was either his back, or his ghost's, or Satan's in his guise, bent over Ralph's deak. He moved, but it was only to dip his pen in the ink, and then went on writing so industriously that he never heard her as she tiptoed across the floor till she stood by his very shoulder. Already, she saw he had covered several sheets of foolscap.

Was this phenomenon of flesh or fantasy? Gen:ly she touched his shoulder and said, 'Ralph!'

He leaped round to confront her. Then, as of Yore, his eyes smiled pleasantly.

'You startled me horribly,' he confessed.

With the familiar voice her air altered and grew older. 'Then you haven't left yet?'

It seemed to her that for an instant he looked a take disconcerted; but as quickly he was his sauve

'Not yet, Esther.'

When is your train?

It has gone some hours ago. Sit down, dear. let me take your cloak. A cigarette? Something

the shook her head, and, wondering greatly, come a chair on the farther side of the fire from halph On both, the habit of considerate restraint the so strong that though each betrayed the agitaa clearly to the other's eye, neither spoke nor ated as if greatly stirred.

got your message, she began.

Por Leonard!' he replied. 'I hope you forgave lib '

'l forgave him,' she answered quietly. That is all I can expect."

He took a cigar, and this time cut and lit it; Laber Fatching him in silence with a torturing carried that at last could be stifled no longer.

Tell me, she cried, 'what has happened? Why te you still here ?

Laber, aid he, I am afraid I must ask you to is prepared for unpleasant news."

What?

'I came in just after you had gone, and about half-an-hour later, while Evans was finishing my packing and I-I was waiting, a man called to see me. He gave no name, and I went down to the library a little mystified, as I dare say you can imagine.'

As he hesitated in an odd way for him, she said impatiently, 'I can imagine perfectly. Who was he ?'

'He was young, well enough dressed, though he wore his clothes a trifle awkwardly, and evidently in a humour inclined towards the aggressive. "Whom have I the pleasure-et cetera?" I inquired. I am sorry I cannot imitate the Canadian accent, but in plain English his answer was "Ralph Delane."

'Ralph Delane!' cried she. 'I didn't know there was any other. What Delane?'

'My nephew, it appeara,'

Her restraint had vanished now.

'But you had only one brother!'

'He is George's son.'

'His! Oh, I see.'

Ralph's voice became singularly gentle.

'I'm afraid, Esther, you don't quite yet. It seems that George made a marriage of sorts in one of his Canadian trips. This Ralph is legitimate.'

'Then why haven't we heard of him before?' she asked quickly.

'His mother died when he was very young, and it was only lately that he learned the facts of his parentage, and what they entailed.

He said these last words in a tone so significant that she started uneasily.

'What do they entail?'

He was sitting opposite to her, and though he only bent forward in his chair, she felt sure that had it not been for that evening's work he would have been very close to her side as he answered, 'I've told you, I think, that George died very suddenly during a business visit to the States. He died intestate, and I succeeded as a matter of course to everything he possessed. Esther dear, equally, as a matter of course, this young man takes my place.

'And gets everything?'

'Except the few hundreds a year my father left me.

'But-people often dispute these things, don't

'He showed me the certificate of his mother's marriage, proof of his own identity, and so on. He'd been well primed by some enterprising solicitor, I assure you. Of course one could make a fight; but I'd certainly lose in the long-run; and besides - don't you think a squabble with one's nephew for a fortune, which one knows in one's heart really belongs to him, is a trifle-undignified or unchristian-whichever you like to call it?'

'Does he actually want it all?'

'Can I ask him that? If you saw the young

gentleman I don't fancy you would. Frankly, I didn't like him.'

She said nothing more, but gazed into the flowerpiled grate with an air so thoughtful that her late partners would have found it hard to believe that this was in truth the gay Mrs Ralph Delane.

'Then,' she asked almost in a whisper, 'we shall

be quite poor?'

'Quite poor, Esther.'

He looked at her as though he longed to come to her, but was kept in his chair by some force too

strong for him.

'And you will have to give up this house—and lose Hazel Hall too—and—and your bog in Ireland'—he seemed to catch a gleam of humour for an instant in her eye—'and give up three or four clubs—and your dinners—and probably some of your friends.'

'Seventy-five per cent.,' he said quietly.

'And everything that made your life what it has been?'

'As you say, I shall have to give up nearly everything that made my life—what it has been. But, Esther, I have been thinking chiefly of you. Do you realise what it means to you?'

She hardly seemed to hear this last question, for

her eyes were turned to the desk.

'Were you thinking chiefly of me when I came

in?' she asked with an innocent air.

'I had been; and that suggested the necessity for doing something. So I thought I'd take advantage of our friend Leonard, and try to rub the rust off my pen.'

'Already?'

His eyes gleamed with a brighter light than she had seen there for many a day.

'The sooner one begins to toughen one's hands the better, Esther. Don't you think so?'

She shot him one odd glance, but answered

nothing.

'Of course,' he went on, 'everything depends on you, and how you'd like to live, and how we are able to manage. I needn't refer again to what you heard to-night from Leonard; you understand what I mean. I was a discontented idler. You can decide how to treat me. I leave everything in your hands.'

He waited for her answer, but now she seemed engrossed in contemplation of the mantelpiece. Then suddenly, with a quick and keen regard, she

asked, 'Where is my photograph?'

He slowly put his hand into his breast-pocket.

'Did you burn it?' she cried. From his pocket he took it out.

'I have it here. I only meant to take it with

She averted her eyes quickly, but not before he had time to see that their expression had strangely altered. For a moment they both sat silent, and then with a smile a little humorous, but chiefly sad, he resumed the discussion.

'Esther, I'm afraid I haven't had much experience of cutting according to my own—or any one else's—cloth; so you had better decide everything for both of us. But I am afraid you are tired, dear. Would you rather advise me in the morning?

Suddenly she fell upon her knees beside his chair

and threw her arms about him.

'Dear Ralph!' she cried, 'at last we need each other.'

THE END.

GREAT MEN AS COMMERCIAL ASSETS.

REAT men are an extremely close corporation, and their commercial value to the country appears at first sight to be so microscopic as to be quite overshadowed by their literary or scientific value. But if the body

of 'great men' in its widest sense is comparatively small, the subject is inexhaustible; and the more it is considered the more clearly it appears that there is a distinct commercial value in that long roll of honoured names of which we are apt to say, with the pride of safe mediocrity, 'He was too clever to make money.' We associate money-making with anxious plodding, with a level-headed directness of outlook, with an office stool and a monotonous daily routine; not with poet's dreams or scientific speculation, not even with accomplished work outside the daily mill! These have their reward in honour, not money; but in this estimate so many side-issues crop up that it is worth while pausing for a moment to consider them. And in regard

to literary men at least, it is certainly true that during their lifetime their monetary value is very generally a negligible quantity, and it is only succeeding generations who realise that they are in any way a commercial asset.

We who have grown accustomed to the thousands of visitors who make their yearly pilgrimage to Stratford-on-Avon-not because of its intrinsic beauty or for its Elizabethan buildings, but because Shakespeare was born there, and went 'unwillingly' along its streets to the old school, and made the cottage at Shottery immortal-can hardly realise what the demure little country town would be like if all remembrance of him could be swept away; or, to go a step farther, what a national loss it would be, not only of fame but of money, if the names of all our great men could suddenly be blotted out, with the places that they had rendered famous! How the towns and villages would sink back into unimportance, and the tide of travel be dried up at its source! Except for natural beauty,

there would be nothing to mark out Stratford-on-Avon from Ealing or Matoppo from Portobello, and no one would dream that either one or the other could be made a paying investment, except by the prosaic growth of flats and villas. Shakespeare himself would be probably quite as bewildered ss any one else if he could realise that he had dowered his country with an ever-increasing commercial value, if he could see the careful treasuring of the relics of his simple life in the town that is sacred to his name. Great literature does not always pay those who create it, but it always pays its heira Many painters of great pictures have lived unrewarded; the writers of great poems have sold their copyright for a bare subsistence, and been thankful to get it; and we can often only measure their commercial value by contrasting the places that produced them as we know them with what they would have been without them.

So the value of Scott as a commercial asset has risen enormously since his death, and is steadily increasing, until the hordes of visitors who follow in his wake seem fairly to rival the standing population. The sentiment that clings to Abbotsford has spread through the length and breadth of Scotland, and at the touch of that magic pen the Sleeping Beauty has been stirred to life and has become a living, breathing soul. The Wizard's rod made of dead places a great and haunting radity-Melrose and the Trossachs, Abbotsford and Edinburgh, have felt that powerful influence; and now the Wizard himself, after the awful threr of his later life, lies sleeping peacefully enough in Dryburgh Abbey. To the Scotch were committed those ten talents of his genius, and, like the thrifty men that they are, they made of them ret ten other talents, not hidden in the ground, but bearing interest a hundredfold; but so great to them appears Scott's literary value that perhaps ther do not fully realise how enormously he counts

The royal road to Edinburgh is a pilgrims' way transled by the jealous footsteps of the lovers of bott; and though his value to literature may perhaps be tested by the great company of his ration, his commercial value is altogether incalclable. Posterity would have paid the claims of as creditors in a very short time by the profit from us books and the gate-money of Abbotsford alone; or nost of those who knew him in those days of porty and hopelessness and failing health were at the seeing enough to prophesy it. He was eakrapt, and it is common knowledge that literain does not pay.' Time has proved the fallacy. lit countripped his compeers and won the race; the Saul, he stood head and shoulders above his chorn, and it may fairly be claimed for him that to be outreached all other writers since Shake-Pare. He vitalised the characters he created, and take them living beings more real than the men ad women we meet and pass on the road of everyar lik. He wrote in pain and trouble, sometimes

with the haste of an impressionist, haunted by dreams of his creditors, and very likely he gauged his own success, as others gauged it, by the sums paid to him for his novels; but long after that 'romance in stone' had ceased to keep open its hospitable doors, long after he had reached the limits of his endurance and lain down to rest, the pilgrims of his genius trod, and are still treading, the way he went.

What is there to mark out from the ordinary labourer's cottage that small house near Ayr where Burns was born? If he had not written immortal verse, would one person in a hundred have turned aside to visit the village or the Kirk o' Alloway, which still echoes to the hoof-beats of Tam o' Shanter's mare? Perhaps the monetary value of his association with Ayr is hardly appreciated, so great is his literary value. He was a genius and a Scotchman. Could Scotland ask more of him than that? Though farming did not pay him particularly well, and though in the Excise his salary never rose to more than seventy pounds a year, still literature does not 'pay,' and it was only what his worshippers expected. They were proud of his poems, of his genius, of his poverty; and yet now, by the mere magic of his name, he has directed into the small community in which he was born and laboured, a tide of travel that is a direct and enormous gain to his country.

So, also, the 'cult of the Brontës,' which in Haworth has taken to itself some of the mystery and the strength of the mysterious moorland on which the sisters lived and died, gives thousands of worshippers to that shrine on which their genius conferred not only immortality, but also a definite monetary value which increases year by year.

And so the living streams swell into a river, and pour their tributary waters into that ocean of accomplished work, the Poets' Corner of Westminster Abbey. There great statesmen, great divines, great poets, all that we include in the idea of great men, jostle in sculptured marble and in enduring brass; and, amongst the thousands who visit the place, very few are attracted by its architectural beauty or its artistic expression. They go to stand bareheaded amongst that vast company of the great whom England has delighted to honour. It has a value quite its own, of which dry statistics give ample proof, equal to the literary and scientific value of that tremendous roll of honour which includes all great lives, great thoughts, great heroisms.

Beyond and above the great men of literature and of art there are, of course, great men of science and practical great men about whose monetary value there has never been any doubt, who pay directly into the Exchequer of their country money forged with their brains and stamped with the superscription of genius. The man, for instance, who made three blades of wheat to grow where one grew before not only deserved well of his country, but paid her well. The man who affirms that in

the near future he is going to prove that the old, clumsy method of farming by means of a rotation of crops is absurd and obsolete, who by a bacteriological injection into the roots of cereals will introduce nitrogen direct into the soil instead of by the system of leguminous crops, where the land lies fallow, with a waste of one year in three—that man is going to be a far-reaching commercial asset.

The thinkers of great thoughts, the writers of great books, and again the books about books, the biographies, the lectures, the cheap reprints, the reproductions of splendid pictures, all express the monetary value of great men, and are part of the fortune they have bequeathed to their country.

And so, to sum up, it appears that life and death—the birthplaces and the tombs of the great—form their principal asset from the commercial point of view. Great men may starve in Grub Street, or in its modern equivalent; they may struggle against

disease or live in bad climates through a weary lifetime, wresting the jealously guarded secrets of Nature from her unwilling hold; but whatever life may have meant to them, death will set things square. Great literature will become classic, and time will only increase its value.

Sometimes this does not appear to be the case. We see the apparent failure of great hopes, great powers, premature death, and obscure graves which hide the tragedies of genius; but each fleeting dream may have meant a nearer approach to an ideal that will be realised by-and-by: the indirect influence on others of some suggestion, traced perhaps to a forgotten book that never even paid for its printing; the first impulse towards some great discovery, obscure fancies; all the trivial, unremembered, unrequited labour which helps towards the finished building—these are all impulses towards the stream of accomplished work which, though it does not always pay the workers, pays such immense returns to other people.

THE LOST 'LEAD.'

THE STORY OF AN EXTRAORDINARY MINING VENTURE.

By J. L. HORNIBROOK.

aine no

ACK in the early eighties, two travellers—miners, both of them—were tramping across the great plain which lies to the south of Cañon City, Colorado. Being what is commonly called 'down on their

luck,' they were heading towards the latter city in the hope of striking something there. They were destined, however, to 'strike' something on the way, and that of a very surprising and remarkable description.

During the midday halt, and while they were speculating rather dolefully on the somewhat precarious prospect before them, one of them happened to pull up a tuft of rank grass. Judge of his surprise, his gasp of astonishment, when he found beneath it a shining white substance which proved to be a nodule of almost pure silver. He held it up to his companion, who immediately sprang to his feet. They had made an unexpected, an astonishing discovery. Both men were fired by the thought that silver—silver in an almost pure state—lay around them in unknown quantities.

Needless to say, they went no farther. They set to work at once, pulling up the tufts of grass with feverish haste; and under almost every one of them they found little lumps of the same precious metal. The place seemed to be literally teeming with silver. They had only to pick it up like pebbles off a beach. That night, after toiling hard all day, these two homeless wanderers lay down with the comforting assurance that they were worth something like one thousand pounds.

They talked over their remarkable discovery, and of course decided to keep it secret. To prevent others from encroaching upon their rights they staked off a claim where the silver appeared to be richest. They had, as they conceived, an immense fortune within their grasp.

They were not, however, left long in sole possession of this silver field, as it may appropriately be termed. In some way, news of the extraordinary 'find' leaked out, and people came hurrying from Cañon City and all parts around; they arrived in units, in batches, until the whole place was overrun with eager searchers. In a very short time there were thousands on the spot. Speculators, too, with gangs of miners at their backs. made their appearance on the scene, staked out claims, and started what is known as 'surface' mines, for the ore was never found at any great depth. With almost incredible swiftness a busy town sprang up, connected by a railway line with Cañon City. The place was not inappropriately named Silver Cliff.

A considerable quantity of silver, amounting in value to some fifty thousand pounds, was extracted from these surface mines, and then, as if by magic, the ore gave out. Experienced miners on the spot declared that it was merely a 'pocket,' and their conclusion proved to be right. Ore was only found within a limited area, deposited amongst soil which had all the appearance of being volcanic. The supply, so far as could be ascertained, was now at an end.

Still the main body of workers did not despair.

The search was continued; 'prospect' holes were driven into the ground in every direction, and miles of trenches dug. Ore was found at a distance of some miles, but it proved to be of very inferior quality, and totally dissimilar to that which had given Silver Cliff its name.

The prospectors ranged farther afield. The hills in the vicinity were explored and tunnelled, and every effort made to trace the source from which the silver had originally come. It was in vain. They failed to discover the lost 'lead.' Finally, when abour and money had been freely expended, the search was abandoned, Silver Cliff deserted, and in a few months' time the last of its inhabitants had quitted it for good.

Several years passed, the story of the lost 'lead'
vas almost forgotten, and Silver Cliff was reduced
to a mere rubbish-heap.
Then a new figure appeared upon the scene.

This was one Caleb Johnson, a miner from California, and a miner, too, of great knowledge and experience. He had heard of the lost 'lead' and the vain quest of those who had laboured to find it. The story appealed to him. He determined to take up the search himself.

Johnson, though he had started as a rough miner, was a man of considerable ability. He had gained a lair knowledge of geology, which had often aided in in locating a rich vein, and was looked upon as an expert in all questions relating to mining. Moreover, he was noted for the dogged persistency with which he pursued any enterprise he happened to take up. He journeyed to Silver Cliff and proceeded to examine the disused workings. He provide about there day after day studying the soil and the surroundings, and endeavouring to solve the mystery of the lost 'lead'—a mystery which had baffled so many others. At last he trivied at a remarkable and distinctly novel coaclasion.

From his observations he was of opinion that the ore had come from a considerable distance; that, in fact, at some remote period it had been that, in fact, at some remote period it had been like the forth from the fiery throat of a volcano. Similarly high into the air, it had described a long it to the south, and settled in the stream of lava which had flowed down into the plain. There it had remained hidden for centuries until accident reals it to the two minera.

Following up the theory he had formed, his ten problem was to discover this extinct volcano. It calculated as closely as possible the arc which it or must have described through the air, and calculy piched upon a rugged hill seven miles ally harled.

He proceeded to explore the hill in question, but here, as yet, he found little to support his beet. There was no evidence to show that it really was an extinct volcano. The crater, if there ever was one, had been choked up long ago. You did the ground, which was broken and

rocky, display any indications of the presence of silver.

Still he held firmly to his opinion. So great was his belief in it, indeed, that he journeyed to Boston, and laid the whole matter before one or two mining magnates in that city. They listened to him with the closest attention. His story was fascinating. The idea of a prehistoric volcano which, instead of stones and ashes, poured forth masses of silver appealed to the imagination. If this man's theory was right, enormous wealth lay hidden somewhere in the heart of that mountain. Finally Johnson said, 'The silver is there. You may take my word for that. We may have to bore a mile into the hill before we find it; but, once we do, we can quarry it out like stone. It may cost thousands of pounds before we strike the ore. I admit that it is a chance. We may fail or we may win. The chances are that we shall win.'

His earnest, straightforward manner, the facts which he brought to bear, carried conviction. A syndicate was formed, and Johnson was sent back to Colorado to commence mining operations, with ample funds at his disposal.

He began by driving into the hill a tunnel fifty feet wide and eight feet high. It was slow, laborious work, for in many places they had to bore through the solid rock. But as yet there were no indications of silver. And then, after months of labour, when they had penetrated several hundred feet into the hill, the first surprise came. One day Johnson picked up a small nodule of silver, weighing perhaps an ounce, and of almost pure quality. He hastened to compare it with a specimen found at Silver Cliff. They were identical. It was enough for him. It proved conclusively that his theory was correct. He immediately suspended operations and hurried back to Boston. Laying the specimen on the table before his principals, he said, 'This shows I am right. The silver is there. Now we can go ahead and search for it.'

Before they give their sanction, however, the books of the syndicate were produced; and it was found that something like thirty thousand pounds had been expended in procuring that single ounce of silver.

Nothing daunted, the members of the syndicate determined to persevere; for by this time they were ready to pin their faith to the bold miner, more especially as he had produced such striking evidence in support of his theory. Johnson was practically given a free hand, the whole direction of the enterprise being left to him.

Before returning to the scene of his labours he displayed a map of the mountain, and showed where he proposed to sink his shaft; for he had made up his mind to abandon the tunnel. He stated his belief that they would find indications of ore at a depth of about fifteen hundred feet, but would probably have to penetrate to more than double that distance before striking the lode. It was agreed that he should be allowed to bore to a depth of five thousand feet before there was any question of the enterprise being abandoned.

Backed up with ample capital, Johnson returned to Colorado and commenced operations on a new scale. He procured air-drills and other mining machinery, erected a shaft-house, and engaged a staff of seventy-five experienced miners. The men were to work in eight-hour shifts, twenty-five at a time; so that the sinking of the shaft was to go on without intermission night and day.

That was at the end of the eighties. The work went steadily on month after month, year after year, and people flocked from all parts of Colorado to see this wonderful mine. The powerful drills were grinding continuously through the rocks, though as yet there was no trace of ore in sight. Down, down went the big shaft, two steel cages passing each other day and night.

For five years the work was continued without interruption, and a little settlement grew up around the mine. Then came the slump in silver coinage in the States. The members of the syndicate grew alarmed. Johnson was summoned in haste to Boston. Would the mine pay now? Johnson, sanguine as ever, declared that it would; for in his mind's eye he still saw those masses of solid silver buried in the depths of the hill.

Again he went back to the scene of his labours. The limit of five thousand feet had not yet been reached, and until then he would not give up hope. Even after all these years he had still implicit faith in his theory.

A year or two later a great streak of silverbearing mineral was discovered. Men were set to work upon it, and followed the dip of the vein for over one thousand feet. Sometimes the ore was rich in silver, sometimes it hardly yielded any. It is estimated, however, that about fifty thousand pounds was brought back to the coffers of the syndicate, though exact particulars were never allowed to leak out. The officials at the mine, including Johnson himself, were extremely reticent. Even at the headquarters in Boston no information was obtainable.

Eight years ago the shaft had reached a depth of over two thousand feet. The vein had not yet been exhausted, for it was found to have many windings; and it is supposed that the silver brought to the surface was enough to recoup the syndicate for their initial outlay.

And so, presumably, the work goes on to the present day; though whether Johnson's dream of those solid masses of silver down below will ever be realised it is impossible to say.

WAR.

LIAU-YANG.

Swift through his antercom the sun Strides to his throne from out the east, And in one short-lived dawning hour Day opens like some gorgeous tropic flower.

Wakes now to life a little farm, That crowns a hillock overgrown With orchards all fruit-laden yet— An isle midst seas of golden corn-fields set.

Beyond, a circling stream that flows
Through rocky gorges in and out
The ridges that enclose this scene,
And hold a thousand such their crests between.

And this the checkerboard on which Th' unhallowed game of war is played, Leaving a desert seared with fiame, Torn by the ghastly customs of the game.

Here, stretched in long, thin lines of black, Across the descrated fields, Men wait for death with pride or fear Till, flung from far, red death is busy here.

Here men must stand, or swiftly move, As ordered by some unloved man; And even break God's law, and kill, Till they themselves lie stained with blood, and still. What glory do these soldiers gain
That fight not knowing how or why;
The coward ranking with the brave,
All heaped unknown into a common grave?

Men play with death and men as pawns—
By some mad king the game prepared;
Nor rue they in their eager play
Th' unnumbered thousands that must mourn some day.

And while the pawns drop from the board The fields in distant lands are bare, And starving children cry for bread When he, for whose return they pray, lies dead.

The battle to the north has rolled,
And Pain and Death stalk grinning here;
The bodies in the trampled wheat,
And burning farm with ghastly mirth to greet.

How slow the burning sun sinks down!
For thirst the wounded cannot cry;
Yet still the tide of men streams past,
And leaves no help for those here dying fast.

No matter. It is ended now.

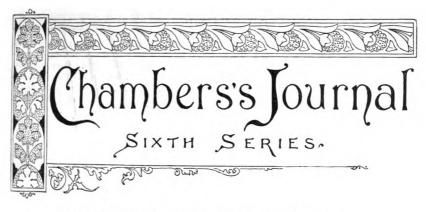

Swift night, with cool and kindly hand,

Draws her dark veil across the ground

Where these at last their prayed-for peace have found.

N. B.

THE THOUSANDTH WHALE.

By J. J. BELL.

PON the moderate swell rolling into the ice-formed bay from the open Arctic Sea the *Thorgrim* lay and swung in a sullen fashion, her ninety feet of dingy-green hull dipping into the gray water till the scuppers gurgled.

Across her narrow deck the clammy mist was blown like smoke, while the bitter wind drew longsustained tenor notes from her slim ochre funnel. To starboard, the shape of a small berg, perhaps thirty feet in height at its highest point, was dimly visible, and Sigurd, the mate in the steering-box of the Thorgrim, found no other object as he slowly turned his keen eyes round the limited circle which the fog left to them. Yet less than five hundred yards away rose the sound of breakers, the rhythmic crash of the surf against the edge of the ice, the mosning echo from the icy waste that stretched through scores of miles to Greenland. The moaning echo is a weird thing, but Sigurd the mate was used to it. He listened for nigh a minute, then sharply jerked the cord of the fog-horn.

\$-\$-poop! cried the horn shortly, and the ice gave back echoes innumerable.

Almost immediately the captain appeared at the door of the tiny deck-house above the cabin, and made his way to the steering-box. He received his mate's report, verified it by listening for himself, and nodded. The mate took the wheel, and called down the speaking-tube to the engineer. For five nimits the Thorgrim moved slowly ahead, then take to rest and resumed her rolling.

Tell Ové to take your place, and come you to the cabin, said the captain as he descended the expendicular steps to the deck. 'Tell Hansen to bring coffee,' he added. 'We shall soon have work to do. The weather will clear within an hour.'

In an hour, kaptan! exclaimed the mate, taring; but the other was already entering the dek-house.

The time was two o'clock on the last afternoon of August, and the *Thorgrim* had lain in and catiously dodged about the ice-bay since the even-No. 472.—Vol. X.

ing of the 23rd. Storm had forced her to seek that precarious shelter; fog had helped to imprison her there. She was about seventy miles north of the mouth of Isafjord, the great indentation in the great north-west promontory of Iceland—so the captain guessed, and the mate hoped he was right. The business of the *Thorgrim* and the eleven Norwegians on board her was to chase, kill, and capture finner-whales, and tow the carcasses to the company's station, with its flensing-slips and oil-factory, in Isafjord. But the hunting season, which begins in mid-April or early May, was now at its fag-end. Indeed, the 15th of August had seen its close so far as the majority of the competing companies were concerned.

When Sigurd the mate came into the cabin, which was heated to a high temperature by the almost red-hot stove, he flung himself without a word on the port locker, loosened his muffler, set his pipe going, and began to read a Norsk illustrated journal, ragged and stained and four months old. Kaptan Svendsen did not like to be disturbed when he was playing 'patience,' for he gained inspiration as well as mere amusement from his wellthumbed pack of cards. Now his strong, steady hand laid down card after card, while his fine blue-gray eyes-under their heavy, almost white, brows-watched each one as if for some important development. Presently Sigurd threw aside the journal, every word of which he had read twenty times, and began to watch also, resting his forearms on the edge of the small triangular table, with its peg-holes for use in rough weather.

A puff of cold air rushed into the cabin, and the cook came cautiously down the steep and narrow stair bearing a tray.

'Coffee, kaptan,' he said, handing a large mug half-filled with the fluid to the card-player.

'Tak!' briefly returned the old man.—'Sigurd!' he said without looking up.

afternoon
n in and
the even[All Rights Reserved.]

The mate took the mug, laid it within reach of
the captain's hand, and secured it on the table with
four wooden pegs which he found on the ledge of
DECEMBER 15, 1906.

the bunk at his back. Then he took in turn his own mug, a basin of sugar, and a tin of condensed milk from the tray, pegging each to the swaying table.

'Biscuits,' murmured the captain, holding out an

impatient hand.

'The fine biscuits are finished, kaptan. I have nothing but these,' said Hansen, laying a wooden bowl of ordinary ship's biscuits on the table.

'What?'

'We have been at the sea twelve days. It is not usual,' replied Hansen sulkily. 'The milk also is finished—all but what is in that tin. There is also but little beef left, and you cannot have any more sweet soup—nothing but brown bean, and the beans also will soon be done.'

But Kaptan Svendsen had gone back to his cards. 'It is all right, Hansen,' he said pleasantly, without looking up. 'We shall be at the station in time for dinner to-morrow. It will be clear weather in less than one hour.'

The cook took his own mug of coffee and a biscuit, and seated himself on the locker beside the mate.

'So, kaptan?' he said. 'But if we leave in an hour we shall be at the station in time for breakfast.' He spoke as if the captain required to be humoured. 'For breakfast, kaptan,' he repeated.

Sigurd nudged him to be silent. The old man appeared to be making a calculation from the rows

of cards in front of him.

At last he looked up and bundled the cards together, laughing as he did so. He put sugar in his coffee, added milk from the jagged hole punched in the top edge of the tin, and took a long draught of the almost cool mixture.

'For dinner, Hansen,' he said quietly. 'The

Thorgrim will have a whale in tow.'

'Kaptan,' said Hansen, respectfully enough, 'we saw no whales all the four days before we came into the ice. Are not all the whales gone south by now? Besides, it is ill weather for hunting. And —and the food grows scarce. Ten—eleven days—it is unusual. I—I was not warned.'

Sigurd nudged him admonishingly; but Kaptan Svendsen took his cook's remarks calmly.

'You have food for all for eight days yet, according to the rules of the company,' he said. 'Have you not?'

Hansen began to stammer. He had known that this was to be the last trip of the season. He had been led to understand, also, that it was to be a run to the ice and back, only one day to be allowed for looking for whales. He had considered one-half of the usual stores more than sufficient. He said a great deal more, but all to the same effect.

The old man let him finish.

'So!' he said, and turned to the mate: 'Sigurd, go on deck, and bring me word of the weather.'

'Ja, kaptan,' answered Sigurd, and, knotting his muffler, left the cabin.

'Hansen,' said the captain, gazing earnestly at the sullen middle-aged man opposite him, 'do you sail on a whale-steamer next year?' 'Unless anybody prevents me,' muttered Hansen.

'I will not prevent you, but I require your promise—your oath—that you will never again break the rules of the company. You promise? You swear? Good! I know you will not fail again.'

'I am sorry, kaptan,' murmured the cook, honest

regret in his voice and expression.

'That is finished, Hansen. We speak of it no more. It is our last trip together.'

'Ah! You do not come again to Iceland, kaptan?'
'Nej. I retire,' answered the old man, smiling.
'I stay at home with my children and grandchildren in Sandefjord. I kill no more whales—but one. One more. My—— Well, Sigurd?'

The mate entered quickly, beaming. 'The weather clears, the wind falls, kaptan!'

Svendsen nodded with a pleased air. 'I shall soon kill my last whale—my thousandth whale! May he be a great bull—a king blaa-hval!'

'A thousand whales!' gasped the cook.
'Nine hundred and ninety-nine have I killed for my company,' said the old man proudly. 'Shall I go home to rest and tell my grandchildren of my life before I kill the thousandth—Sigurd—Hansen?'

He held out his great hand.

Sigurd shook it, laughing. 'The glory will be mine also, kaptan. I have told you so before.'

'Ah, yes, you knew it was to be the thousandth whale this trip, my Sigurd.—But you, Hansen—you will wish me luck?'

But the cook smote his hand on the table and cursed himself. What if his carelessness in the matter of provisions should force a return to the station ere the thousandth whale could be captured?

'Have I not told you that I will kill my whale before night?' said the old man, still holding out his hand.

Shamefacedly, Hansen took it. 'I have plenty of flour. I will bake extra bread now,' he muttered as he rose.

'If you like, Hansen—if you like. But it will not be required.'

For a moment the cook looked at the mate. Then he saluted the captain and left the cabin.

'Let us go on deck,' said Svendsen five minutes later. 'You and I will load the gun. Do you get forward the new harpoon that we took on board last week. I will not use an old one on my thousandth whale.'

The wind had dropped, and the sun was already piercing the mist, which was thinning so rapidly that bergs and sheets of ice came into view like objects on a photographic plate in the developing-bath. The crew appeared on deck smiling; but the smiles vanished when they saw the preparations for loading the gun. They had counted on a quick run back to Isafjord.

Kaptan Svendsen, fondling a cotton bag containing about a kilogramme of powder, nodded pleasantly as he passed them on his way to the bows. To two of them he gave instructions to

remove the tarpaulins from the powerful doublewinch immediately abaft the foremast, and to see that its machinery was in perfect working order.

Sigurd was already waiting on the foot-high platform in the bows beside the short, thick-set, sariet-painted cannon, the horrible harpoon on his left shoulder, a ramrod and a supply of wads in as right hand. Kaptan Svendsen examined the harpoon-every inch of its five-foot slotted shaft, in which ran the ring for carrying the cable; each one of the four hinged barbs, now lying against the shaft, but ready to open umbrella-wise within the victim. So far the harpoon was without a point.

The captain expressed himself satisfied, and Signed laid the hundredweight of metal on the platform. Then the gun was uncovered and unashed, and slewed round on its pivot for loading. lasly, Sigurd went below, to return speedily, bearing something resembling a torpedo in shape, tet about twelve inches in length, and sharp-nosed. This was screwed on to the end of the harpoon, we projecting from the gun's muzzle; and the arpoon was complete—pointed with a bomb that would explode shortly after striking.

it four o'clock the Thorgrim left her refuge, iolging the larger fragments of half-rotten ice, saouldering aside the smaller. Outside the bay, and for several miles from the ice-sheet, ice-pans hom one to a hundred square yards in extent based on the still heavy swell, their surfaces descring white, their sides glowing sapphire above is rater-line, and pale, cold green just below it. The ware-tops were brilliant in the sunshine, and every plunge great clouds of spray burst over the Theorems bows, battering the canvas shelter of a steering-box, rattling and hissing upon the innel and flooding the deck to the very stern. i srendsen laughed aloud as he guided the little camer among the pans southward. Ove, the exceed mate, who was steering, caught the infection the high spirits and came out of his sulky

The sea falls, kaptan,' he remarked cheerfully. We have luck with us.

Sgard, muffled to the eyes, his hands in heavy rollen, fingerless gloves, was already in the long, and barrel high up on the foremast. No eyes this could be trusted to detect the rising or conting of a finner on that tumbling expanse. Take he had little hope of seeing another pearlyby 'pout' rising from the water that season, and his captain's confidence and enthusiasm, he arched the surface of the sea as he had never artief it before. For surely the thousandth this rould be a very great thing for the old man and grandchildren.

and even as he thought of it, behold! two miles the solur n of watery vapour rose twenty feet the air, and as it began to drift away there had above the surface, moving leisurely westnga tounded, glistening, dark object—the back da whale It sank

Sigurd turned in the crow's nest and roared 'Hval!' at the steering-box, following up the word with directions to the steersman. Then his eyes went back to the sea.

Almost immediately the whale came up again, showing first the crown of his head, which was submerged ere the back appeared. He sounded as if melting into the water, only to reappear three minutes later. At each of these risings he blew, but not so heavily as on his first appearance. Then he went down once more, and Sigurd did not expect to see him again for fifteen or twenty minutes. But he had judged his course, and already the Thorgrim was doing her twelve knots and executing a flanking movement.

Svendsen had taken his stand on the gunplatform, and was making final tests of the bearings upon which the weapon rested. He smoked in an unemotional fashion.

'Kaptan!'

The old man looked up.

Sigurd was grinning over the edge of the barrel. 'It is the thousandth whale!' he cried. 'And it is as you desired—a blaa-hval, sure!—a great blaa-hval !-- a solitary--a bull !'

'So!' said Kaptan Svendsen contentedly.

The cook came forward and saluted apologeti-

'Well, Hansen, how goes the baking?' inquired Svendsen merrily.

'I come to wish you good luck, kaptan,' said the other. 'Also, there is little coffee and no sugar for the men. I-I am afraid of some of the men, kaptan.'

'Are you afraid to tell them that there is no sugar, and that there is also ten kroner for each man from myself when we reach the station? I ask you to tell the men that, Hansen.'

Hansen's reply was incoherent.

'Tell the men also,' said the old man, 'that yonder is my thousandth whale. They will understand and have patience with their kaptan. Go now, Hansen.'

Hansen obeyed, and having told the men, retired to the galley and resumed the manufacture of bread as if his life depended on turning out so many loaves ere nightfall. He was thinking of all the whales he had seen escape.

The whale rose again, but he had quickened his pace during his submersion, and appeared farther west than the mate had anticipated. The course of the Thorgrim was altered, and the engineer managed to cram another half-knot on to her speed, whereat her excited quivering was increased to frantic quaking, and the waves burst heavily over her bows, drenching Svendsen to the waist. It was no weather for hunting, thought Sigurd as he described great irregular arcs in the air, but one could not expect to choose the weather when fortune had sent the Thousandth Whale.

An hour passed, and still the 'blue' unconsciously dodged his pursuers, changing his course of speed, so that once Sigurd thought him lost, and five minutes later beheld him in such a position that the Thorgrim must have actually passed over him. Moreover, it was a race with time, for the light would soon be failing, and Sigurd smelt snow.

The captain kept his stand on the bowplatform, his drowned pipe in his teeth, his face running with spray. From time to time Hansen brought him dry gloves, for a numbed finger at the critical moment might mean a bad shot. The men attending the winches stood stolidly at their posts, thinking perhaps of the ti kroner which each would receive, and-perhaps not so selfishly-of the old man and his thousandth whale.

Suddenly Sigurd shouted and pointed. The 'blue' was rising not a hundred yards away on the port bow. The wind dissipated the cloud of vapour from his blow-hole as his head went down and his enormous back heaved up amid the waves, slid forward, and was submerged. Already the captain's left hand had shot up, and the steersman had called to the engineer for 'dead slow.' The course was altered ever so little, and the Thorgrim moved slowly forward, and then lay wallowing, awaiting the second rising of the 'blue.'

Captain Svendsen's gloves were gone; his big hand gripped the short stock of the gun; his forefinger was crooked on the trigger. His pipe was still between his teeth.

And then, not five yards distant, and almost straight ahead, with a snorting, hissing sound, the head of the 'blue' broke the surface. Two seconds later the gunner let fly, aiming-if that were possible in such a sea-for the most vital region six to ten feet behind the flipper. A whale stricken nearer the tail may give trouble for many hours.

So the gun crashed out its dreadful bolt, and the monstrous tail of the 'blue' rose high in the air, fell, and disappeared in a boiling whirlpool. And almost at the same instant Kaptan Svendsen turned on his heel in the smoke, signed to the men to clap the brakes on the winch, and left the platform. Without a look to right or left he walked swiftly aft.

Sigurd came down from his perch, his face set, and took charge. He had seen the harpoon glance across the 'blue's' back and plunge into the sea fifty feet beyond, the bomb bursting like a silly rocket. Somehow he had never dreamed of the captain missing his thousandth whale-not even in a hurricane.

In silence the men hauled the cable and spent harpoon on board, while Sigurd saw that the gun was covered and lashed in position. On his way to the cabin he looked into the galley. Hansen was sitting with his face in his floury bands, weeping.

'Bring coffee,' said Sigurd quietly, and passed on. He found the old man playing 'patience,' and sat down without speaking.

Presently, with his eyes on the cards, the captain

said casually, 'If the weather does not change, we shall be at Isafjord for dinner to-morrow.'

'Ja, kaptan.

Svendsen laid out another row of cards, and Sigurd picked up his tattered journal.

'The course is sou'-sou'-east,' remarked the captain after a silence. 'Order full speed now. I will come on deck soon.'

The mate left the cabin. At the top of the stair he met the cook.

Twenty minutes later the twain, accompanied by the engineer, entered the cabin. The old man was still fingering his cards.

'Why have you not ordered full speed?' he asked. Then, noticing the engineer, 'Is anything wrong?'

The engineer shook his head. 'The engines are all right,' he said, 'and there is coal for twentyfour hours.'

'Kaptan,' said Sigurd, 'the men say that they do not wish to return to the station yet. And we say

'I-I do not understand,' said the old man, staring at a ragged queen.

'Ah, kaptan, kaptan,' cried the cook, his voice fluttering, 'your thousandth whale-you must have it yet, kaptan.'

The cards dropped from the old man's fingers.

'So!' he said very softly.

'I go to bring coffee,' said Hansen abruptly, and fled from the cabin.

'So!' murmured the captain again, and a pleased smile came to his lips. But the smile faded. 'The risk is too great,' he said gravely.

The engineer spoke. 'If the Thorgrim does not reach the station to-morrow they will send the other whaler or the big steamer to look for us. It is quite safe.'

'And when would they find us, my good Olaf? In many days perhaps.'

'Hansen has bread for about four days,' put in

Sigurd. 'We are all content with bread.' But if the bad weather comes, and we have to

wait in the ice?'

'Let us hunt for one day more, kaptan.'

The old man wavered. The temptation was very

'I will speak to the men,' he said at last, rising and gathering up his cards methodically.

Ere the long twilight ended in black night the Thorgrim was once more idly rolling in an ice bay, waiting for another chance. And that chance, thanks to a grievous change in the weather, was full three days in coming.

'They will be searching for us now,' said the men one to another, and scanned the sea anxiously, for bread and water is depressing diet within the

Arctic Circle.

During the fourth night the wind died, and early the following morning the Thorgrim left the ice for comparatively calm water. The captain went into the steering-box to relieve the mate.

'Turn in, Sigurd,' he said. 'There will be

acting to do on deck. Hansen will give you the last up of coffee. I thought it was finished, but be found enough for two cups this morning. He is like a baby, is Hansen.'

'I do not need coffee. I will turn in there,' the mate replied, pointing to the crow's nest.

Srendsen lifted a protesting hand. 'It is no use-no use,' he said sadly. 'We go as straight as we can to the station. We shall all be starving when we get there. May the fog keep away!'

Sigurd descended to the deck. As if it were an aterthought, he remarked, 'I will look out for the stamer and the other whaler,' and went forward.

'That,' said the old man, 'is a wise thought, Sigurd.' He gave a direction to the steersman, and at down in the corner of the box, gazing listlessly shead.

But Sigurd, in the crow's nest, kept his eyes on the near waters.

At midday the sun came forth, and Svendsen took is slitted and worked out the Thorgrim's position. He was about forty miles farther from home than he had guessed. The discovery annoyed rather than alarmei him, and he was about to summon the mate from the masthead when the latter threw up his arms with an exultant yell:

'Hval! Hval!'

In less than a minute the old man was on the pation uncovering and unlashing the gun. To its suprise, it was already unloaded. He heard Sgud's laugh, and he looked up and laughed in reum.

'My good Sigard !'

Hanen, looking like a ghost, peeped from the galler, and the men took their places by the

The whale rose again, and Sigurd yelled that he was bigger than the one which had escaped. The hangy men at the winches grinned. They were sect to whale-hunting; but this—

Kaptan Svendsen set his pipe going. He was kinself again. He fondled his gun.

At Signut's direction, the steersman had sent the Region right about, and she was now running before the smooth waves. On board excitement, are my to patience. The captain called Hansen, but despatched him to a locker in the cabin, there is find a tin of cocce—the last food on the *Thorgrin*. I mag for every man,' said the captain.

About two o'clock the whaler had been maceurred to within striking distance of the talk The 'blue' rose on the starboard bow, and rose again nearer, sank, and finally rose so doe under the Thorgrim that the gun when fired to the talk at an angle of forty-five degrees.

The cable flashed over the bow-wheel for thirty sonal; then its speed slackened, and the brakes were gradually applied to the winch until it stopped maning. The cable between the winch and the way was rigid as steel, but the *Thorgrim* street not. Her nose was deep in the water and

her propeller showed a dry blade. Death hung deep in the sea at the end of the cable; no wounded life struggled there. The shot had been a sure one. A hundred tons, perhaps, of living matter had plunged madly for the depth, and, plunging, had died, heart and lungs wrecked by the exploding shell.

Three hours were occupied in hoisting the carcass to the surface, lashing it alongside, cutting the mighty flukes from the tail, and inflating the body with air pumped by the engine through a hollow lance. Then a chain was rove through and around the tail-stump, and the carcass was cast astern, attached to the *Thorgrim* by thirty fathoms of a twelve-inch hawser. Already hundreds of sea-birds were screeching above the dead, while Greenland sharks took their toll beneath.

'Full speed!' cried the captain down the tube, and immediately the homeward run began.

But the old man's triumph flickered out.

He went down to the cabin, after summoning the engineer.

'How many hours' coal have you now?' he asked.

'Fourteen and a half, kaptan,' answered Olaf, who had just been figuring it out.

'And we are about twelve hours from the tation.'

'Good!' said the engineer.

'Twelve hours going at full speed, Olaf.'

'I have full speed now, kaptan.'

'Ja. Your engine is doing full speed, but the Thorgrim is doing little more than half. It is the whale'——

The engineer's face fell.

The mate looked out of his bunk.

'We are farther from the station than you thought, kaptan,' said he.

'I meant to tell you, Sigurd,' returned Svendsen, 'but the whale came. When the whale came I forgot everything else. I was foolish to take the whale, and now I must let it go. It is no use. We cannot take the whale to the station. Let it go now, and do you take charge, Sigurd.'

'But, kaptan'--- began the mate.

'I say it is no use,' interrupted Svendsen. 'Do as I tell you—now. Leave me. I am tired. I am an old man, and an old fool. I have been risking my men and my ship for my own conceit. I tell you that, Sigurd; and you also, Olaf. I thank you and every one for standing by this silly old man, but I will take no more risks. Go now. I would sleep. It is long since I have slept well.'

'I beg to know what distance we are from the station, kaptan,' said the engineer respectfully from the doorway.

Svendsen told him shortly, and waved him and the mate away.

In a little while the *Thorgrim* stopped, and the old man in his bunk heard the tramping of feet above him.

'They are casting off my thousandth whale,' he

said to himself. 'So!' And soon with sheer weariness he fell asleep.

Sigurd the mate stood in the crow's nest. It was growing dark, and the wind was bitter though the sea was calm. Sigurd had been up there for four hours, which is a long spell for a well-fed man. For the third time he sent for the engineer, who for the third time came to the foot of the mast.

'How long now, Olaf?'

'One hour-no more, Sigurd.'

'Kaptan is still sleeping?'

'Ja. Hansen watches him. Wonderful Hansen! He has discovered one more cup of coffee for the kaptan! It is cold up there?'

'Ja.

'But no one else has your sight. I will tell you when the time is up.' The engineer departed,

Sigurd drew his muffler over his mouth and resumed his search. The stars came out, and a fine, dry snow drifted down. It soon ceased, but Sigurd knew there was much more to come erelong.

The time, despite his miserable situation, passed all too quickly, and the engineer's voice came up to him, saying, 'The hour has gone.'

'Can you not allow half-an-hour longer, Olaf?'

' Nej.'

'Quarter?'

'Nej, nej. We can do no more.'

'Then it must be,' said Sigurd, struggling with his cramped limbs, and taking a last look about him.

A cry broke from him. 'Quick, Olaf! The blue light! I am frozen here. I cannot move yet. Fire the light, and help me afterwards.'

Soon the *Thorgrim* and the sea around her were bathed in a ghastly glare. The engineer swarmed up the rigging to assist the mate, and even as he reached him an answering flare, small but certain, appeared away in the east.

'It is the steamer!' yelled Sigurd. 'Tell the

kaptan. Do not wait.'

But the engineer insisted that it was Sigurd's duty, and so five minutes later the latter staggered into the cabin where the old man was sleeping, watched by the cook.

'Kaptan, the steamer comes. I have signalled her, and she has replied.'

'So!' said Svendsen, getting up slowly. 'If I had been sure of the steamer I would not'-

The cook could contain himself no longer.

'You have the whale still!' he cried. 'Oh kaptan, you have your thousandth whale!'

'Mutiny on my last trip!' said Captain Svendsen when he learned from Sigurd how his officers and crew had arranged, against his orders, to keep the whale in tow till the last possible moment. 'Mutiny on my last trip!' But his eyes were kind.

As the *Thorgrim* steamed to meet the rapidly approaching steamer the old man stood on the afterdeck peering at the huge, dim shape wallowing

astern.

Hansen approached.

'The last of the coffee, kaptan,' he said respectfully, presenting a steaming mug.

'Then you will drink it yourself, Hansen.'

The cook protested.

'I have now drunk the last of the coffee five times,' said Svendsen. 'When did you taste coffee last?' he suddenly demanded.

'Four days ago, kaptan. It is nothing.'

'So! Then you have saved your own coffee for me! Have you any more left?'

Hansen looked guiltily miserable. 'Enough for two mugs,' he stammered at last.

'For me?'

'Surely, kaptan.'

'Then I drink this, and you will go now and take the two mugs yourself. The steamer will give us plenty soon. Now, go. No more mutiny.'

The cook went, but halted half-way to the

galley and retraced his steps.

'Kaptan, you—you will soon be telling your children and grandchildren about your thousandth

'My thousandth whale,' said Kaptan Svendsen, smiling reflectively. He laid his hand on the other's shoulder. 'Yes, it will be a fine story to tell. But I think, my good Hansen, the finest part of the fine story will be about my men on the Thorgrim.'

And Hansen retired, rubbing his eyes, yet so pleased with all things that he divided the last of the coffee between Sigurd and the engineer.

IS ARGENTINA'S PROSPERITY PERMANENT?

By HERBERT H. BASSET.

BOUT eight years ago, when the aftergloom of the Baring crisis still hung heavily over the land of Argentina, I ventured to write an optimistic article in these columns on 'The Coming Revival of South

America.' Argentine Government bonds were then selling at a discount of from 20 to 30 per cent., and

are now over par; Buenos Ayres and Rosario Railway shares were about 65, and are now 118; whilst land companies' shares which were bought at a few shillings apiece have jumped in value to many pounds. These comparisons are made for the purpose of indicating the enormous change in values during the past decade. Equally marked improvement has been shown in Chile, Brazil, and

Peru, and in the Central American states, as well as in Merico. As the interests of British investors in Argentina and South America generally now run into some hundreds of millions of pounds, it is well worth a moment's thought in order to analyse the causes of the change and to estimate the permanent character of the prosperity which now rules throughout the South American continent.

Argentina, with which republic we are mainly concerned, as British capital is invested more largely there than in the other states, owes all its prosperity to a remarkable series of bountiful harvests. Much is attributed to the absence of revolution and civil warfare, but this was not the original cause of the prosperity. It is poverty which begets sedition and revolution; and volatile s the Latin-American may be, yet he has no desire for revolution when his granaries are overflowing, his cattle growing in number day by day, and his stancia generally a picture of increasing wealth and content. There have been ample excuses for revolution if the desire had been there. The increasing taxation of the labouring classes in Buenos Ayres, such as exists to-day, would ten years ago have bred a provincial outbreak in a very short time; but, despite the presence in the 'Queen City' of some scores of the worst class of European labour agitators, the political and civil world is comparatively untroubled. The profits made by the farmers, stock-breeders, and merchants have natly increased their spending power, and they have laid out large sums on new buildings and improved agricultural implements and up-to-date machinery, the great bulk of which has gone to the Intel Kingdom; whilst the railway wagon-makers of this country have been unable to keep pace with the big orders received from Argentine railway companies. The railway companies (all controlled by British capital) have made enormous profits a the carriage of the grain; indeed, there are ler departments of trade connected with the River Plate that have not been enriched as the result of the bumper harvests which have annually seconded each other for the past six or seven

It is unnecessary to observe that I claim no great breaght in having predicted this revival. To any the having regard for the existence of trade and unal cycles, it was obvious that but a few years pas before prosperity again came to the conting as a result of improved harvests. It is beause Argentina depends, not partially but wholly, n is gain producing and stock-raising powers that is well to consider its economic position at the Power time in order to gauge the future prospects the country. Bad harvests, even a succession of ben, nay occur at any time, whilst the locusts are drift an incipient evil, and rinderpest is not an BLOWN Scourge Is Argentina's financial and traomic position such that it could pass through misfortanes without any serious depreciation thing place in the enormous capital which the

British investor and manufacturer have lavished upon the country?

In order to answer this question satisfactorily it is necessary to assume the existence of the troubles mentioned. The first year would doubtless pass lightly over the estancieros, as reserves hidden away during the days of prosperity would prove ample to meet any difficulties; but a repetition would at once necessitate a limitation of expenditure, the reduction of labour, and the consequent curtailing of employment throughout the country. Whilst this would not have been a serious matter ten years ago, it would have an important bearing on the position to-day. During the past decade thousands of Italians, Germans, and peasants from southern Europe have poured into the country, and there has been a constant flow of immigration from South Africa since the Boer war. There is probably a more mixed population of nationalities in Argentina to-day in proportion to its total strength than in any country in the world. There has been no restriction placed on the class of immigrants admitted to the country; and, whilst it is believed in official quarters that there was no need for this restriction, it is yet a matter of common knowledge that a very large proportion of the worst class of immigrants has not gone beyond the city of Buenos Ayres, whilst many of the better-intentioned immigrants have been caught by the beauty and riches of Buenos Ayres, have spent their little capital in the Parisian attractions of the place, and have become one of a great mass of flotsam and jetsam that seeks a doubtful livelihood in the 'Queen City.' Any restriction of employment in the provinces would cause a general drift to the city, and here there are so-called 'labour leaders' and political office-seekers only too ready to use the unemployed in any time of trouble in order to foment agitation and political disturbance.

The economist will point out that such incidents are common to the development of every new country, and their effect may be alleviated by sound government, especially where, as is the case in Argentina, the nation has amassed considerable cash resources. Thus we are brought to consider the question of how far the Argentine Government has used or is using the immense wealth which has flowed into the Exchequer for the purpose of consolidating its financial position and rendering a repetition of the Murrietta failures and pre-Baring days impossible. If the reader can conceive of the Imperial Exchequer of Britain overflowing with gold as the result of years of prosperous trade, whilst the Manchester and Liverpool Corporations are defaulting in the payment of interest on loans borrowed from German investors, he will acquire some idea of the anomalous position in which the Argentine Government stands to-day. The Argentine Government claims that it is not responsible for debts incurred by the provinces. Nor is the Imperial Government of Great Britain responsible for the payment of the debts of Manchester or Liverpool; but if the British Government were seeking to rehabilitate its financial position and national credit in the eyes of the world, it is inconceivable that it would not recognise moral responsibility for the debts of its children, and take such steps for control over their future borrowings as might be necessary. Yet the Argentine Government has refused to recognise either legal or moral responsibility for the defaulting states of the nation, or to introduce any legislation by which a repetition of the disgraceful Cedula default might be made impossible. In industrial matters its legislative activity has been equally non-existent. Labour troubles are more or less to be expected; but no effort has been made to remedy the treatment which has more than once been served out to British companies operating railways in the republic, when the Government has openly encouraged strike movements. Those industries, which were welcomed in the days of Argentina's gloom, are now being used by the provincial authorities for the purpose of raising money by taxation. As an example of the heavy taxation, it may be mentioned that bread is more expensive in Argentina than in those countries to which it exports its surplus wheat-stock of about two and a half million tons. First of all, there is the tax on the transport of wheat, then comes the millers' tax, and the heavy charges that the bakers have to pay, all of which mount up to a considerable item in the cost of an ordinary loaf of bread. Taxation of this kind can be understood when the national Exchequer is hard pressed to find funds, but it is not an indication of sound government when the country has some millions of gold locked up in the national till.

In social matters it is only necessary to point to the existence of the 'white slave traffic' of Buenos Ayres, and the constant comments which appear in the local press on the impossibility of any lady passing through the streets of Buenos Ayres city without molestation. In public works there has been neither enterprise nor wisdom exhibited. Whilst the Government has expended money in constructing handsome and palatial buildings, it has done nothing towards remedying the many evils under which shipping arriving in the port of Buenos Ayres suffers, whilst it can with safety be said that there is not a single highway throughout the whole country that would not become impassable after a few hours' rain. It has, on the other hand, outlined a lavish programme by which it proposes to spend six million five hundred thousand pounds in building large warships and providing floating batteries along the River Plate-bellicose move-

ments highly unnecessary and impolitic in view of the Government's agreement a few years ago with Chile, when the navies of the two countries were simultaneously reduced. Every movement of the Government of Argentina points towards a personal or national aggrandisement without consideration for those necessary measures of wise statesmanship which are vital if the country is to secure that solidity which alone can carry it through a period of non-prosperity.

Argentina is, as I pointed out in my previous article, a country full of natural resources. When Nature shines upon it all is well, and Nature has shone upon it of recent years with unparalleled generosity. But what will happen when drought, the locust, and cattle disease play havoc with the natural productions of the country? Looking through a copy of an Argentine paper to hand by a recent mail, I observed that the locusts had invaded one part of the country, and a stock-raiser had set out in figures the approximate amount which he had been forced to expend on dry food for cattle. I reproduce the figures as given:

IUI Cature.	2 2 0 P 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	•		
	maire at 50 della	ars per ton	15,000	dolla
300 tons or	limize at 40 dollar	s per ton	6,000	**
150 tons of	pran at 40 donar	dollars per ton	13,500	**
450 tons of	ary allalla at to	on, &c	5,000	н
- 1 !			3,500	
Labour, &c	s of troughs at 3	dollars per mètre	3,000	, ,,

46,000 dollars.

The correspondent concludes: 'Add to this the value of our own twenty-eight stacks of alfalfa and the purchase of steam-engine and maize-crusher, &c., and you have got what a seven months' drought and a visitation of locusts means.' The locust fiend is the most dreaded evil among the estancieros. They sweep across large tracts of verdant grass covering an acreage equal to Great Britain; and, unless a strong wind drives them onwards and maybe out to sea, they leave behind them in a very short space of time devastation of pasturage and possible ruin to the farmer.

In investment matters there is a time to buy and a time to sell. The man who can select the psychological moment does not exist. But it is well that British investors, who have at stake in Argentina many millions of pounds, should recognise that this is not an injudicious moment to scan their investment risks in this quarter of the globe. If my previous article resulted happily for those readers of this Journal who embarked capital in Argentina eight years ago, it is possible they may be glad to have this short summary of what I believe to be the outlook at the present moment in the land of La Plata.

THE LORD OF THE MANOR.

CHAPTER IV.

Snatters turned out, Clifford Warrener was destined to something besides the conventional meal temptingly offered by May Castlerayne. He had come down to stay for a day

or two with some friends in the seighbourhood; he had telegraphed to say that her might expect him about dinner-time; his kitbug had gone on in advance. Outside the gate of the Towers a messenger awaited him with a note. It appeared that the telegram had been delayed, the which is a pleasing malady with the average railway sation telegraph-office, where labour is scanty and electric message importunity of little favour. There vas nobody at home at The Haven, and the butler, who had been away all day, had taken the liberty st opening the telegram. A wandering gamekeeper ad chanced to see Mr Warrener, and thus his movements had been recorded. Meanwhile, the inhag and its contents awaited the good pleasure d the owner thereof.

Veryawkward, Clifford muttered. 'The Marchnonts are all away. I did not know that when I degraphed last night. Perhaps I had better have my lag sent over to the Royal Hotel at Hardlowegh. There is a train about six, and '——

'indeed, you will do nothing of the kind,' May aid with decision. 'We will send the donkey-cart lick your bag, and you will stay here to-night.—

'int Gerrude, will you be so good as to neglect par precious flowers for a moment? This is Mr Warrene, who is belated and stranded by the way, the past for the sole of his dress-slippers, so to sak tome and persuade him to dine and spend is night here.'

Aunt Certrude came slowly down the grass path klor the rose-bushes. There was a flush on her ple fac, a questioning in her eyes as they fell may Warrener's tall figure. She seemed to be ioning into the past, beyond the events of the cold, and year. She breathed just a little faster; her is true parted.

an glad to see you, she said. 'My dear boy, to we very, very like your father.'

Warener took the alim hand extended to him his dit to his lips.

I am more than pleased to meet you,' he said. have heard so much of you from my father. He said a dilude so frequently to the Towers. He spoke it as one of the most charming houses he had set been in, and I am bound to say that he did so traggerate. After the rush and fret of a great war, this is utterly restful and soothing.'

Called spoke with a deep sincerity in his voice. Is gate wandered from the short, thick turf at his to the rose-garden, and from the garden to the cap talk of the house in its frame of deeper, more

frowning gray, and the vivid trees beyond. Verily, here was a place to be envied. It looked as if trouble and war could not live here, as if the burdens of the world had been left on the other side of the stream.

But Warrener knew better than that; he knew of the grim poverty that lurked behind the smiling flowers. He knew of the pride that pinches, the pitiful arrogance of the decaying race. And he was in a position to alter this with a wave of his wand. He could scatter aside all those carking cares and take the wrinkles out of Mr Castlerayne's brows. He would not have been sanguine but for the forces arrayed behind him.

'Mr Warrener is going to stay here to-night,' May said. 'There has been a mistake over a telegram, and he is stranded here. I will send the donkey-cart over to The Haven for the luggage.'

'Of course,' Aunt Gertrude observed as if it were the most natural thing in the world, 'it is a genuine pleasure to have a Warrener here. Your father and my brother were such great friends in the past. Come into the hall and have some tea.'

Warrener hesitated. It was hard not to see Angela again; it was equally hard to stay there and partake of the hospitality of a man whose prejudices the guest was going to violate ruthlessly and mercilessly a little later on. But the great oak door of the hall opened at the same moment, and Angela stood there with the amber light of the fading sun on her face. She stood there tall and fair and stately, a slender figure in white. She started, and her face coloured strangely as she saw Warrener. It seemed to him that her look was one of cold surprise.

'I did not expect to see you down here,' she said.
'We are ever the sport of circumstance,' Warrener replied lightly. 'I have been over the Common with your sister. My idea was to stay with the Marchmonts to-night; but I find that they are away from home. Miss Castlerayne has very kindly offered to put me up this evening. I feel like an intruder, really; but'—

Angela smiled gloriously. Whatever her feelings might have been, a lack of hospitality certainly was not one of them. A Castlerayne could not possibly have been guilty of that failing. The girl extended her hand to Warrener quite warmly.

'Of course you will stay the night,' she said. 'I was just coming to call the others in to tea. You have certainly arrived at the psychological moment.'

Warrener passed into the dim hall, full of cool brown shadows and sweetly fragrant of roses. The light filtered through the stained-glass windows; it fell on the dainty tea-service, flickered on the facets of old silver that shone as only old silver can. There were comfortable lounges here and there, the suggestion of comfort that only a refined English

home can give. Warrener abandoned himself to the exquisite pleasure of the moment.

Mr Castlerayne was glad to see him when he came presently from the study. It was a great pleasure to him to have the son of his old friend under his roof. Perhaps the host was secretly surprised to find that contamination with trade had left no brand on Warrener. Perhaps he had expected to see a man in loud clothes, with a loud voice, who talked a jargon of discounts and par values and the fluctuation of stocks and shares. So far as Warrener was concerned, he, like Gallio, might have cared for none of these things.

Tea came to an end at length. There was a lovely hour spent in the garden, and then dinner. It was a plain dinner, though the wine was excellent; so, too, were the peaches and nectarines gathered fresh and ruddy from the ripe south wall of the garden. Warrener lingered afterwards over a cigarette and a glass of claret the like of which he had never tasted before. He felt just a little ashamed of himself; he was a kind of traitor in the camp. He wandered off presently to the drawing-room, where the lamps were not yet lit. Angela was alone there, playing some soft and soothing melody on the piano.

'We did not expect you quite so soon,' the girl said. 'The others are in the garden. Shall we join them? Really, it is a most exquisite night.'

It was indeed an exquisite night, full and warm, and gently lighted by a crescent moon. A pearly diaphanous mist was rising over the Common. Beyond it the great belt of pines loomed out like the masts of ships in a summer sea.

'The Common always looks like a pearly land at this time,' Angela said. 'It seems almost a pity to get near enough to destroy the illusion.'

'All people do not take the same view of it.' Warrener laughed. They had paused before the old sundial. Angela stood leaning on it with an arm that gleamed like ivory in the moonlight. 'I am told that there are prosaic eyes on the sacred spot.'

'I suppose you got that from May,' Angela said a little coldly. 'Some people in Hardborough want to start a hotel here. Of course the idea is preposterous. Fancy our Common being made the abidoing-place of Saturday till Monday people, who smoke cheap cigars and drink beer! My father would never listen to such a suggestion.'

The speaker looked proud and scornful in the moonlight. Lady Clare Vere de Vere might have presented no more contemptuous a figure. She seemed a being of another world, a race apart. And yet in its way it was not devoid of cheapness, the juggling of theatrical show. Angela had no sympathy with the lower classes, yet she did not so much mind being dependent on these creatures for little things she could not pay for.

'Is your father likely to have the last word?'
Warrener asked.

'Well, really, I suppose so,' Angela said. 'I dare say May has told you everything. There is a man

called Craggs who has advanced some preposterous claim'——

'I would not run away with that idea if I were you. I believe that Craggs and the hospitallers are quite within their rights in this claim. I have gone into the matter carefully. To do Craggs justice, he is as much averse to the hotel idea as you are. At the same time, he naturally looks the Common to provide the money income to keep up the hospital. Poor old Craggs is just as proud in his way as you are.'

'My dear Mr Warrener, does the moonlight always make you talk nonsense?'

'I am talking no nonsense,' Clifford repeated. 'Do you know what I would do with you if I had my own way? I would make you get your own living amongst the people whom in your heart of hearts you so despise! You should go amongst them and discover for yourself that there is as much pride and dignity in labour as there is in the caste. I have seen enough of it, and I ought to know. When I was quite a young man I lodged for a time in the cottage of an artisan—I could afford no better quarters. That man taught me more than I ever learnt at school. His feelings and sentiments were those of a refined gentleman; his wife was his equal in every way. He is one of my managers to-day, respected and liked by all who know him. It is only a matter of refinement and education. Craggs would have been a statesman and a Cabinet Minister if he had only had the chance of the modern boy. If you took a little girl from the slums of London—the child of the gutter, I mean-and educated her properly, do you suppose that anybody could guess what her parentage had been?'

Angela smiled faintly, with her proud head uplifted to the stars. It was strange how this man always thrilled her, how exalted she always felt in his company. The girl regarded his lapse into trade as an obsession, the backsliding of a gentleman. Perhaps it was contamination with soap that made him talk in that way.

'I should not be in the least interested,' she said. 'I am quite content with my lot.'

'But how long is it likely to be your lot?' Warrener proceeded. 'Forgive me if I speak too plainly; only recollect the interest I take in your future welfare. Have you ever thought what is likely to take place if anything happens to your father? He may die at any time—we all have to die sooner or later. I understand the estate'—

'It is very polite of you to call it by that name,' Angela said with some bitterness.

'Goes to the next of kin. It passes from you altogether. Angela, have you'----

The girl faced round on Warrener almost angrily. Her eyes were blazing.

'Really,' she said—'really, Mr Warrener, you forget yourself! Your only excuse'—

'Is the excuse that every man has in the presence of the woman he loves. I have never told you that I cared for you, for the simple reason that there is so necessity. You know it. If you can look me in the face and say honestly that you did not know it'—

'I think that will do,' Angela interrupted. 'We had better go and find the others.'

She flung her glorious head high in the air. The dignity of her manner was queenly, and yet down in her heart was a certain wealth of gladness; her lips, red and full, were curved in a little smile.

(To be continued.)

CURIOSITY-HUNTING.

By R. A. GATTY.

HE rage for collecting was never more fully developed than at the present time. No matter where you go, every one you meet seems to have some craze after things beautiful

and rare, from postage-stamps to problem, and curiosity-hunting is a recognised form of sport. Nevertheless, there is perpetual grunbling on the part of collectors that things grow scarce and dearer, while frauds and fakes abound on all sides, demanding greater care and cation on the part of would-be purchasers. This sall very true in a general sense; but it must be remembered that the world contains more treasures than erer it did, for each generation in turn bequeaths its valuables onwards, never removing anything as it passes away, but always adding to the world speak speak store.

It will be found that fashion is answerable for a good many of the fluctuations affecting the curiositymarket. Some one brings forward a fresh idea, sch as old pewter, and farmhouses and cottages are assacted, and a boom begins, till the prices run m to a preposterous height far beyond the worth d the article. In the same way, what was once at the top of the market may find itself displaced by one fashionable craze, just as Chippendale now the precedence of old oak furniture. The coleder never knows how long public favour will or what will be its next development. This particularly refers to letters and relics of distinraised persons. A few years ago no one would an imagined that an unsigned letter of Nelson's, ration to Lady Hamilton, would realise over one bound pounds at public auction; and it will be toned that a good many Nelson relics have changed and lately owing to this rise in prices.

is a wonderful what quantities of curiosities at discovered each year by excavations, notably a Egypt; and when you think what has been lost a kepst, it is curious that so little seems to be smelled in England, which has always been largely produced. The real fact is that nobody looks, and a tarthing ever is picked up it is due to a chance and it is a labourer in the fields. Some years ago, a Vortabire, a man went to a farm for a day's toright with the farmer. In the morning, as they as smoopany them. The sporting friend noticed is; attached to the dog's collar was apparently

a brass ring, which the farmer explained his servant had ploughed up the day before and tied to the collar. When the ring was removed the friend pronounced it to be gold, and he offered to take it into town and get it valued. The farmer assented, but he said he would rather have some silver spoons than money. These the jeweller readily agreed to give, and he afterwards sold the ring for twenty pounds. The next time the ring changed hands it fetched three hundred and fifty pounds, and it is now in the British Museum. It is a Saxon ring, having in enamel the words, 'Ethelswyth Regina.'

It may be said that this is quite an exceptional case, and a man might live to be a hundred and never get such a chance; but how many people ever make the attempt? It is slow and tedious work to walk up and down the furrows of a ploughed field, or to pace methodically an autumn-sown wheat-field that has been well washed by the winter rains; but it is not altogether fruitless. I have never known flint implements fail, even in districts far removed from the chalk in which flints are found; and the following is a list of things I gathered from a particular field, but not all on the same day: I had more than two-score flints and several arrowheads among them, a few gun-flints (bringing the use of flint up to modern times), a coin of Constantine (showing that the Romans had probably been on the ground), a shilling of Charles I. and a shilling gun-money of James II., a prehistoric jet ornament, a stone spindle-whorl, and a penny token of 1788. In places where Roman camps have been, or Saxon villages, remains of both periods are turned up again and again by the plough, and quite a nice collection might be made if people only searched the ground.

It is certainly easier to frequent curiosity-shops in town; but to be able to do this with satisfactory results you must be an expert. It is not much use merely to be a perfect judge of one thing which you may collect. To get any good out of curiosity-shopping you must know something about everything worth buying; in fact, you must know more, if possible, than the dealer from whom you are about to buy. I remember once being in a well-known jeweller's shop, and while I was looking at some old rings and trinkets my eye caught sight of a ring which had in it a stone with a lion cut on it, and above the lion a single star. I knew it

1

as a Roman gem, and it was the constellation Leo. When I asked the price the dealer hesitated; and, looking hard at me, he asked me if it was a Roman gem. I replied that was what I wanted to know from him. He tried all ways to get me to confess I knew about such things, and when I presently put down the ring, and was going out, he told me he wanted thirty shillings for it as it was, but if it was a Roman gem he wanted more. I took advantage of his offer and bought the ring.

It is always advisable to turn over the loose stones you sometimes see exposed in the window of a small jeweller's shop, generally lying in a saucer. They represent the stones taken from rings at various times, when a customer has sold or parted with his ring in exchange for some other ornament. If you know an antique gem when you see it, you may possibly come across one in such a place, as I have done more than once. It is impossible to say who may have gone into the shop and parted with his gold ring. The stone would be certain to be removed to ascertain the weight of metal, and thrown into the saucer. That stone may have come from Greece or Italy, and may be worth pounds. The jeweller is pretty sure to be ignorant of the fact, and he will let you take any stone you like for the modest sum of one or perhaps two shillings. I got in that way a head which was appearing out of a bath. The stone was a yellow carnelian; but just where the neck was there was an accidental streak of brilliant red in the stone representing blood very faithfully. It proved to be a Roman gem, and is now, I believe, in the Ashmolean Museum. Antique gems are not commonly met with even abroad, and this way of picking them up in England is worth trying when you are hunting up curiosities.

It may be generally taken as an axiom that dealers have some weak point on which their expert knowledge is at fault. If you are cleverer than they are you may be able to get things at very little cost; but, as I have said, you must have an all-round education. Perhaps you are not collecting gems, and you may not trouble about them, or china, or Sheffield plate; but surely if you can secure a valuable article which you can sell again, or exchange, it is worth while buying it.

I was one day bargaining for some bits of old silver, and I noticed what I thought was a sort of medal. It was not in my line, but I was attracted by seeing a lighthouse upon it, and below the words, 'Eddystone resurgit.' The price was only five shillings, and I added it to my purchases. The medal proved a very curious thing. When the Eddystone lighthouse was being rebuilt, the pressgangs used to seize the workmen who went out from the shore each tide to work on the foundations. This became a great nuisance, and hindered the progress of the lighthouse; so an appeal was made to the Government, and silver medals were made for the foremen and officers, and copper ones for the ordinary workmen. I had lighted on one of the former, and the London dealer to whom I sent it, and who paid me as much for it as I had given for all my silver purchases, informed me he would give much more if I could secure a copper specimen, for these were particularly rare, as the men had neglected them and thrown them away.

Many years ago it was not uncommon to see in out-of-the-way homesteads old Delft plates in the kitchen, showing that this Dutch ware was formerly imported into this country in quantity. In the same way a good deal of English ware crossed the water into Holland. A member of the great Wedgwood firm told me that in their old books were entries showing how their best manufactures had been sent abroad, and he had a theory that Holland might be ransacked with satisfactory results, and it might be possible to discover some of their best work hidden away in that country. I tried once in Amsterdam, and found an old Dutch shop which had a room upstairs full of discarded English porcelain, which the owner was ready to sell for an old song. Unfortunately I could find none of the blue-and-white Wedgwood; but I got a good deal of the black ware, and three large crates were sent over to England containing a miscellaneous assortment, including both Bristol printed ware and some nice old Worcester. I was astonished to find the value the Dutch put on old Delft ware which I was accustomed to buy in England very cheaply. To them, no doubt, it was enhanced by being the manufacture of their own country, whereas a perfect Worcester tea-set with the Dr Wall mark was priced at one guinea.

Times have altered since then, and the Dutch dealers are now wide awake, and understand English values as well as their own. Sometimes even now you find an unsophisticated dealer, and I happened recently to be in a shop in Antwerp where, among some old brass pans and kettles, which were shortly to be beaten out into antique curios, I saw three very black-looking breakfast-dishes which I recognised as old Sheffield plate. I was offered the lot for fifteen francs, and was pleased with my bargain. A few days afterwards, when I visited the shop again, the dealer told me he had since been at a sale where he discovered people bidding high prices for this same old Sheffield plate, and he laughingly told me I had made what he called bon marché.

I have always found it the best plan never to show your hand when you enter a curiosity-shop. Look at everything and speak of anything but the article you are really after. If a dealer thinks you want a thing you may be sure its value will rise as your desire is shown, and he is also led to believe there must be something more in it, otherwise you would not be so anxious to have it. You may be certain you will not hurt his pocket, but he may very seriously damage yours. It is distressing sometimes to see how people are taken in. This is nowhere so common as in Egypt, where scarabs made in Birmingham and bronze deities forged by the cartload in Germany are purchased by tourists recklessly, when a little previous education in such

matters would have saved them from loss and disappointment. It would be a grand thing if our museums could be used as training-places for collectors, and a course of such education would be invaluable for those who take up curiosity-hunting. It is a mistake to suppose there is any real dearth of good things. We none of us hold our possessions for long, and there is a perpetual ebbing and flowing of collections, which become spread and squandered all over the world. I am not writing about great works of art, which are all well known and earmarked, but the commoner treasures which the ordinary man of small means pursues with as much kenness and pleasure as the millionaire who can write cheques for everything he fancies. If we come to analyse the feelings of curiosity-hunting, they are really composed of a kind of sporting instinct, of a desire to capture something which rquires skill and sacrifice of time and money. This is very different from the order given to a saler to attend an auction sale and bid up to a certain sum for a particular book or picture or piece d plate. I really think the pleasure of collecting is more in the pursuit than in the thing itself, and the passion is not merely one of sordid acquisitheness or miserly sentiment.

There is always a difficulty over controlling the sope of collecting. You begin, and as time goes the accumulations become almost burdensome. it is only by experience that you find out what rou ought to buy and what you ought to let alone. The great thing is to make up your mind, and stick le otte particular line, whether in furniture or china anything else, and follow it up. Imperfect colctions are of little value, whereas a complete series lustrating a certain period will always fetch a good

l remember that many years ago, after some revotion in Japan, when, I believe, a form of worship ru changed, a quantity of religious offerings were out of the temples. The captain of an lag th ship over there bought as old metal tons d bronze looking glasses and other articles, which rere shipped to Liverpool. A friend of mine hapand accidentally to see these being taken out the ship and thrown on the dockside, and he remaind a considerable amount very cheap. I rat to Liverpool shortly afterwards, and found at the price had gone up considerably, and what

was at first sold by the ton was now selling for so much per pound, for the bronze votive mirrors were recognised as works of art. They were some of them more than this, for they had a peculiar socalled magic property, as they threw the shadow of the figures or decorations on the back of the mirror from the silver polished front when held in the light. I believe no satisfactory explanation has been given of the property of these mirrors, as some experts think there is a faint impression under the silvered surface of the front, and others say the sides of the mirror have been treated with a distorting rod, and the angles so formed that the image on the back is able to project itself. However this may be, it stimulated me to acquire some of these bronze curiosities; but as I never was able to pursue the collection of Japanese things, they remain as mere specimens of metal-work.

I think everybody goes through phases of curiosityhunting. Coins are things which young people take up, and in a way they are highly educational and of great assistance in acquiring a liking for history. I found Roman coins particularly useful when reading the Decline and Fall of the Roman Empire. It inspires you when you have a good first brass coin of Domitian or Nero to refer to while studying the events of these emperors' reigns. But later on, when I had taken up other interests, I stopped my pursuit of Roman coins, with the result that the Imperial Roman series was never finished, and in consequence the collection is of no value at all. I think you come to realise in later life that you have to specialise, and make up your mind to stick to one line only, otherwise your house becomes merely a curiosity-shop, and you find things will not mix and harmonise. Nothing is nicer than a room furnished with old oak; but when Chippendale chairs and sideboards are mingled with sixteenthcentury furniture the result is not artistic. It is a pity, however, not to know something about everything worth collecting. It adds an interest not only for your own benefit, but wherever you go you find kindred spirits glad to exchange ideas with you. Curiosity-hunting is an education in itself; and though there may be people who sneer at what they call a silly craze, they none the less envy your taste, and probably wish they possessed the beautiful things your skill and experience have gathered together.

A STUDENT SCION OF THE SOMERSETS.

HUNDRED years ago it was somewhat unusual to find scions of the aristocracy wholly given over to study and self-improvement, so many instances could be more easily given wherein they were wholly given over h and that was less elevating. Many afterwards Singuished men went direct from Oxford to the

more bracing and stimulating atmosphere of Edinburgh University; John W. Ward, afterwards Lord Dudley, whose Letters to Ivy (Mrs Dugald Stewart) have only recently appeared, was one of them, and gives sure reasons for so doing. To the Bishop of Llandaff he wrote in 1814 of that enormous evil of which for so many years Oxford was the cause: that of teaching little else but idleness and drunkenness 'to half the young men in the country.' Besides Lord Dudley, Lord Lansdowne, Lord Melbourne, and Lord John Russell, as it has been remarked, approached statesmanship with knowledge acquired from Edinburgh professors. Henry Petty-Fitzmaurice, afterwards third Marquis of Lansdowne, came with Lord Ashburton to Edinburgh on the advice of Jeremy Bentham. He attended Professor Dugald Stewart's lectures with Henry John Temple, afterwards third Viscount Palmerston.

We have another example in the recently published Correspondence of Two Brothers: Edward Adolphus, eleventh Duke of Somerset, and his Brother, Lord Webb Seymour, 1800-19 (Longmans), edited by Lady Guendolen Ramsden. The volume is of some historical and literary importance, although each reader must reconstruct from trifling facts and stray hints the picture of the studious and the ducal lives herein only broadly hinted at. The letters are printed mainly from the archives at Bulstrode. Lord Webb Seymour went to Edinburgh in 1797, as he thought for a few years, for purposes of study and congenial society; he remained there for the most part until his too early death in 1819. Every letter and entry in his journal bears witness to the perseverance he exercised in the pursuit of knowledge and of companionship with men who could best help and stimulate him. And yet, beyond these letters and a few scentific papers, the intellectual fruitage of his life is slender, save for the excellent example to his friends and contemporaries, which is well worthy of being perpetuated. According to Henry Hallam, a love of truth and desire for self-improvement were his distinguishing characteristics, and he was a man of the most untainted honour and scrupulous integrity, of the greatest benevolence and warmest attachment to his friends. He seems scarcely to have known anger or any of the violent passions.

His brother, Edward Adolphus Seymour, eleventh Duke of Somerset (1775-1855), was devoted to science and mathematics when at Oxford, was a member of many scientific societies, and president of the Royal Institution for many years. If with no outstanding ability, he was handsome, kind, and genial, and a patron of science and letters, as well as a model landlord. The chapter giving the Duke's 'Dreams, Visions, and Prescience' interest many. Lord Cockburn used to envy Professor Playfair and Lord Webb Seymour their walks and geological excursions from Edinburgh to the Pentlands and the Highlands. In his Memorials he records that Seymour was 'slow, thoughtful, reserved, and very gentle; he promoted the philosophical taste even of Horner, and enjoyed quietly the jocularity of [Sydney] Smith, and tried gravely to refute the argumentative levities of Jeffrey. His special associate was Playfair. They used to be called husband and wife; and in congeniality and affection no union could be more complete. Geology was their favourite pursuit.' This reminds one of the friendship of Tennyson and Arthur Hallam, about whom we hear something in the book. Horner appreciated Seymour's passion for knowledge and his habit of study, intense, 'almost plodding,' while they read Bacon's essays and scientific treatises together, or discussed philosophical questions.

Webb John Seymour was born in 1777, and at the conclusion of his studies at Oxford resolved to cultivate his mind according to his own preconceived scheme of study, which, as Hallam says in his masterly biographical sketch of him in Horner's Life, is rare in a young man of his rank, and was much more so at that time. His equals in rank and intelligence at Oxford thought him wanting in geniality when he did not attend their wine-parties and lived his own life. He read slowly and carefully, and retained what he did read; loved truth above all things, and was earnest in its pursuit. He acquired some knowledge of anatomy and chemistry at Oxford, as well as of philosophy, but had no natural bent for mathematics. The reputation of Edinburgh for moral and physical philosophy drew him to that centre in 1797, with the design of getting into touch with some of the remarkable men of that period. Practically the rest of his life was spent there, in the congenial society of the most learned men of the period. He had the society of Jeffrey and other early Edinburgh Reviewers; of Professor Dugald Stewart, Thomas Reid, Playfair, Francis Horner, Henry Mackenzie, and Sir James Hall; while he had an open door from his relatives in Hamilton Palace, at Dunglass, and many another Scottish seat.

The scare of a French invasion drew him south in 1803 to take command of a battalion of volunteers in Devonshire. He was back in Edinburgh by the autumn of 1805, but in poor health caused by weak digestion, which induced languor of mind and body. In 1810 he purchased the estate of Glenarbach, near Dumbarton, which he reckoned a snug retreat for himself, his books, and friends, for he had the idea that 'nobody can do anything in London.' He tried to sell it in 1812; but Glasgow was suffering then from a stagnation in trade and manufactures. Two years later he sold the estate for thirteen thousand two hundred and fifty pounds. 'In the course of the autumn,' he wrote to the Duke, 'I shall remove to Hailes, a place near the village of Colington, about four miles to the south-west of Edinburgh. It is an entailed place, belonging to Sir Thomas Carmichael, and I have taken a lease of it. The house is not large, but comfortable, and the country near it rather pretty.' In June 1815 it was full of workpeople rendering it comfortable for occupation. Before going to Hailes he dated from Princes Street or 2 Abercromby Place, Edinburgh.

As the editor of the volume does not say anything about Hailes, we have pleasure in giving a few details regarding it. The house, which is situated in the north-west of Colinton parish, between Slateford and Juniper Green, now belongs to an

Edinburgh lawyer. The plain mansion, dating from the end of the eighteenth century, is surrounded by fine, well-grown trees, and to the southast the ground slopes towards Colinton Dell, is the Water of Leith valley, and the Balerno nilway. There is a well-tower (disused) and some rains which lend colour to the statement that Hailes or Colinton Church was once situated here, and that it was the site of a monastery. It is in keeping with the irony of history that it is said that the Duke of Somerset's invasion of 1544-45 destroyed Hailes Church. Hailes was once inabited by Samuel Anderson, banker, who left a small endowment to the poor of Colinton parish. To the north once stood Easter Hailes, the residence d George Drummond, six times Lord Provost of Limburgh, who began that series of city improvenexus of which the end is not yet, and founded the Boral Infirmary.

Hailes Quarry, in the vicinity, when the building com was in progress in Edinburgh from 1820 to 132, produced daily about six hundred cartloads i the hard gray stone, yielding the proprietor that nine thousand pounds a year. The quarry in back for many years, but lately there has en a revival. Lord Cockburn set up his houseand gods at Bonaly, on the Pentland slopes, two way, in 1811. Colinton House, once the existence of Lord Dunfermline, on the opposite the Water of Leith, is the scene of In Oliphant's ghost-story The Open Door. Sir Alliam Forbes, once a resident, married Sir Walter Souts first love. At Colinton Manse lived Dr Lewis kallour, maternal grandfather of R. L. Stevenson, has perpetuated the memory of the valley and s grandiather in Memories and Portraits. Henry Arkentie was once resident at Colinton. Old House had memories of the stout siege ten the laird held out against Cromwell, who so inited his prowess that he let him go free. John whirter, the landscape artist, is a native of daging, the son of an Inglis Green bleacher. et Pollok, author of the Course of Time, resided a time with Dr Belfrage at Slateford. Emeritusdesor Masson was once resident at Juniper David Malloch or Mallet was a tutor to the of Dreghorn when he wrote the ballad of and Margaret.' Beyond the remark that accentry around was pretty, we have no wordfrom Lord Webb, who does gush a little a the English Lakes with Playfair, but is

the citior has missed a story creditable to Lord like sucressity related in Archibald Constable and like sucressity related in Archibald Constable and like sucressity related in the Dugald Stewart managed an annauensis to him, to whom he can be sucressed to give seventy or eighty pounds a year in his employment, and fifty pounds a venue in his employment, and fifty pounds a venue to working for him. He proved the provided when the provided him is the provided him is the provided him in the provided him is pages of abuse and insult, and called Lord him is the most penurious of men, although he had

paid him four hundred pounds for doing practically nothing. Lord Webb continued, while he lived, a payment of fifty pounds a year to the man, although out of his employ, but refused to recommend him to anybody else.

In a letter to the Duke in 1816 he asks: 'Have you the little old book which gives an account of the Protector's march into Scotland? It sells, I believe, at an enormous price. It has amused me sometimes as a mark of the change in the relation of the two countries to think that two places in which I have passed some of my happiest days in Scotland were both destroyed by my ancestor, Minto and Dunglass. There is now a villa upon the ground where the Protector encamped the night before the battle of Pinkie, which I looked over within these two years, having some thought of taking it.' The book he mentions is probably Patten's Expedicion into Scotland (1548). Minto is a seat of the Elliots, on the Teviot, four miles below Hawick, built in the Italian or Tuscan villa style. Dunglass, in Berwickshire, was the seat of his friend Sir James Hall, where he arrived once after his long tour in England with Playfair, and found himself 'in the enjoyment of every blessing that I can desire in the world. The time flew fast, cruelly fast.' Sir James Hall's son, Captain Basil Hall, brought home an Eskimo, whom Lord Webb went to Leith harbour to see manœuvring his canoe. Basil Hall was coming into fame as the author of Voyages and Travels. The track of Seymour's great ancestor the Protector, the Earl of Hertford and Duke of Somerset, sent to invade Scotland in 1545, was marked by desolation and the destruction of castles, monasteries, farms, and cottages. In pursuance of the policy to bring about a marriage between Edward of England and Mary of Scotland, Somerset crossed the Border and defeated the Scots at Pinkiecleugh, Musselburgh. Hence the references in the letter to Pinkie and the destruction of Minto and Dunglass.

Another residence in which Lord Webb was also much at home was that of Professor Dugald Stewart when he retired to Kinneil House, near Bo'ness. It was hither, on the invitation of a former tenant, Dr John Roebuck, founder of the Carron Ironworks, that James Watt came from Glasgow to develop his pumping-engine. The outhouse still stands which he used as a workshop. Kinneil, which belongs to the Duke of Hamilton, affords fine views of the Firth of Forth from the leads, but is now untenanted save by jackdaws. We find Lord Webb in Arran, and at Dunmore Park, where he met Patrick Nasmyth the landscape painter. When his brother the Duke bought Lord Rosebery's house in Park Lane, London, Lord Webb passes on the advice that it is best to buy some large estate sold in a lump by the impoverished descendant of an old family. Then he records having spent a morning at Barnbougle with Lord Rosebery, 'choosing the site of a house and planning improvements on the grounds.' The house would be Dalmeny Park. He reports in

1817 that 'there are now no less than fourteen steamboats upon the Clyde.' The practice of weekends is not quite modern, for a Glasgow steamer went to Inveraray on Saturday, remained over Sunday, and returned on Monday. The crowd she brought to Inveraray rendered it difficult to procure beds or anything to eat.

A letter is given from the Grand Duchess Catharine, who tells her brother Alexander the First of Russia that she could have been the wife of Napoleon. She writes the catalogue of his crimes, and gives, pointedly enough, her reasons: 'In order to show my determination is not the rash act of a light, giddy, and inconsiderate girl, I am under the necessity of trespassing a little on your Majesty's goodness. Although the blood-stained annals of modern Europe are in themselves the private history of Napoleon Buonaparte, I have endeavoured to trace more particularly the character and conduct of the man pointed out to me as my new Sovereign and future lord and master. Alas! Sire, in the long catalogue of his exploits not a single virtue is discoverable that could even extenuate his numerous crimes. He was already an assassin while I was yet but an infant, and every year of my advancement towards womanhood records his perpetration of some fresh and shocking atrocity on the innocent and unresisting.'

The Duke gives us this glimpse of Madame de Staël when in London: 'She was just going out as I got to the door; and but for Mr Rogers, who was coming out as I went in, I should not have gained admittance. There were many persons with her, and she was running about and talking as fast as possible. Her dress and manners are very extraordinary. The news of Lord Wellington's victory [Vittoria] had just arrived, and she descanted upon it with much animation. I cannot better describe to you the bustle she makes than by saying that after leaving her the streets of London seemed solitary.'

Lord Webb and his brother the Duke seem strangely indifferent to literature and literary men. There is no remark in the journal about Walter Scott after meeting him at Elizabeth Hamilton's. When the Lord of the Isles appeared Lord Webb was in no hurry to read it. Waverley, he thought, had many offensive errors in point of taste. He acknowledged merit in the delineation of Scottish character, but two or three of the characters seemed to him caricatures. The Duke liked his fiction best in verse, and when he dined with the Literary Society in London, heard nothing of Walter Scott's new poem but much of Southey's Roderick. Hallam also makes the inept criticism that he found dull parts in Guy Mannering and the Antiquary. Lord Webb mentioned that he had a high opinion of Jeffrey's conversational powers; the Duke retorted that his cleverness was not of the kind he most valued. He was more interested in the origin of language, and subscribed for Dr Jamieson's Scottish Dictionary.

Lord Webb was fortunate in his friendships. Lord Dudley said of Seymour's intimate friend Francis Horner, who, like himself, passed away all too soon, that he was the best and wisest man with whose friendship he had ever been honoured. Professor Playfair, mathematician and geologist, who had Carlyle as a pupil, was devoid of pretension, and a generous and cheerful companion. He felt at Lord Webb's burial service at Holyrood as if he had lost a son. With Henry Mackenzie Lord Webb would discuss legal subjects, and philosophy with Professor Thomas Brown; and when he met casually with Thomas Telford the engineer they talked of Highland problems. In a coach journey in England Lord Webb read Duncan's Logic; while at Keswick, before starting to climb Skiddaw at 12.30 A.M., he had been reading Ossian's poems. His friend Lord Dudley was immensely amused to find that Seymour's holiday reading at Worthing was Bacon's Novum Organum and the Edinburgh

We have too many books about books nowadays, and their multiplication keeps many readers from reaching the really great and good literature by master-minds. But the world is always the better of any truly noble example, which is the main thing left by Lord Webb Seymour.

THE INCOMMUNICABLE MESSAGE.

I stood by the dark margin of the sea,
Its waters weiled in summer dusk from me;
The unseen waves in rhythmic beat
Broke in soft murmurs at my feet,
While all familiar things were lost to sight
In a strange, unknown, empty world, devoid of light.

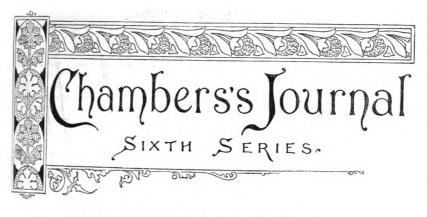

A chill night-wind the only other sound Voicing through space the mystery around; Its soft touch on my lips and eyes, With little sobs and stifled crica, Strove in unguessed-at ways to bring to me Some incommunicable message of the sea.

Cleaving its way through spaces vague and vast, That message reached me from the far-off Past.

It comes, I said, direct to me
From those who crossed this unknown sea—
From those whose barks set sail long time before,
And left me ever mourning on this hither shore.

But all in vain above the breaking wave,
I cried, 'Send back the answer that I crave.'
Hidden the winged mystery
That brooded o'er the unseen sea,
And in a language hard to understand
Was bearer of the message from that distant land.

And afterwards I knew that still despair,
Blown by the wind against my lips and hair,
Owed not to those bold souls its birth
Whose venturous boats had left this earth,
But was an echo of the ceaseless pain
From which my lonely heart will ne'er be free again
AUTHOR OF 'MISS MOLLY.'

HOW THE KING TRAVELS.

By HENRY W. LUCY.

NY years ago Queen Victoria, reaching Windsor after a restful journey from the Highlands, was so touched by the solicitude lavished upon the undertaking that she commanded

the issue of a circular letter to the managers of the lines she was accustomed to use, legging that 'the railway journeys of the meanest of her subjects' might be watched over with equal diligence. Precisely what answer was made by the milway managers to this characteristically thoughtful suggestion I do not know. Talking it over, even at this day, they loyally but ineffectually attempt to repress a smile. It was an observation, like several of Captain Bunsby's, 'the bearings of which lays in the application thereof.' the gentle reader is made acquainted with parimlars of royal journeys by rail he will be in a position to decide how far the ordinary third-class sanger may expect to be dealt with under similar

The accession of King Edward VII. to the throne narked a difference in the use of royal trains. In Vacan Victoria's time journeys within the United lingion ran on almost monotonous lines. The ven travelled either to and from Windsor to hallater for Balmoral, or between Windsor and Assort for Osborne. The latter has been absolutely bundoned as a royal residence, being transformed to a home for sick warriors, their helmets now time for bees.' Though Windsor Castle is retained ad kept in order in anticipation of a royal visit, k King is rarely seen there. When in residence, nd laving occasion to repair to London, he

This habit literally places on a siding the the directors of the Great Western Com-My specially built in commemoration of the completion of the sixtieth year of the late Senis reign. Infinite care and no end of money the lavished on the tribute. The royal train to composed of six carriages, coupled by gangoming a convenient corridor from end

to end of the train. Twenty-four years earlier a saloon carriage was built for the accommodation of Her Majesty when travelling to and fro between London and Windsor. With the affection for old familiar things deeply rooted in her character, the Queen insisted on retaining this old servant. It was a little difficult, since it was out of scale and proportion to the other carriages. The difficulty was got over by taking thought and adding eleven feet to its length. This train is at the disposal of His Majesty, and is kept swept and garnished, but is rarely called into use. If His Majesty travels by rail between Windsor and London, accompanied only by his private equerry, he makes use of the ordinary train, to which a special saloon is attached.

When the King goes to Scotland he travels by the North-Western Company's line. The limited, and therefore precious, area of Great Britain being cut up among the various railroad systems, it is not possible on the longer journeys to keep to one line. Nevertheless, the royal train being made up at the point of departure, it proceeds to its destination, changing engine and guards when it arrives at the terminus of one line and enters upon the territory of another. Going north, His Majesty always travels at night. The train is fitted not only with the vacuum brake but with the Westinghouse, so that if one fails the other comes into operation. Saloon and sleeping berths are lighted by electricity. Between each carriage and the guard's van there is electrical communication, in addition to a special cord placing the guard and the driver instantly in communication. In a carriage in the rear of the train rides one of the principal officers of the company and the carriage superintendent. They are in command of a full complement of artificers, ready to meet every one of the almost impossible emergencies that might arise on the jealously guarded journey.

As soon as the date and hour of the King's journey is fixed, the railway officials begin elaborate preparations. Every detail is considered with [All Rights Reserved.] DECEMBER 22, 1906.

anxious care. The locomotive superintendent personally selects the engine, having first informed himself as to the number of carriages that will constitute the train, the approximate weight of the luggage, and the number of passengers. These particulars before him, having intimate knowledge of the capabilities of the various engines at his command, he selects one most precisely qualified for the work. He also chooses the drivers and stokers, alike for the pilot-engine and the royal train, picking them out from among the most steady and experienced men familiar with every turn of the road.

Some idea of the extreme solicitude which watches over these railway journeys may be gained from consideration of a single fact. In Queen Victoria's time the saloon carriage built for Her Majesty by the Great Western Railway Company was kept at Paddington. With due notice it could be prepared and taken down to Windsor in time to receive the royal passenger. But Her Majesty had royal notions about time. In her opinion, it was made not for Sovereigns but for subjects. It not infrequently happened that only within the last hour before the train must start the Queen's private secretary, who on these matters communicated with the railway manager, was enabled to submit precise particulars of the journey. In order to meet this contingency, the Great Western Railway Company kept another royal saloon carriage at Windsor. Partly to avoid damage to its costly upholstery, partly to avert danger to the royal passenger from possible damp, it was kept all through the year in a shed, the temperature being maintained at a fixed height, just as if it were a rare orchid or a sick child.

In addition to the artificers, a gang of telegraphists, officered by the telegraph superintendent, accompany the royal train. They carry with them instruments and appliances whereby, in case of sudden need, communication can be established at any point of the line. The artificers include fitters, lampmen, and greasers, with plentiful store of grease and oil to be used in the carriage-boxes and the lamps. Like every one else connected with the service of the train that carries Cæsar and his fortunes, these men are the pick of the company's staff. While travelling they keep a constant watch on each side of the train, looking out for defect or irregularity in the running. Whenever the train stops they jump out, carefully examine the carriages, and test, and if necessary grease, the axle-boxes.

A lookout man stands on the engine-tender. Differing from the lookout man on board a ship, he turns his back to the approaching prospect, keeping watch towards the rear of the train, ready to note any signal that may be given. There are two guards, one in the front van and one in the rear. It would be supposed that with all these precautions, and others yet to be described, the royal train might be left to make its own way. That is not the view taken by those

responsible for the King's safety. Fifteen minutes in advance of the royal train runs a pilot engine. If there be any danger in the way it will bear the brunt, and timely warning will be given. A person of fertile, not to say criminal, imagination might suppose that, accidentally or designedly, the rail could be blocked within the space marked by the passage of the pilot engine and the arrival of the royal train. This would be found impossible. The intervening space, at distances not exceeding a quarter of a mile, is guarded by a line of platelayers provided with hand-signals and detonators. Each on his beat carefully examines the line before the royal train approaches. By an exaggeration of caution, the object of which is not immediately apparent, every man must remain at his post ten minutes after the royal train flashing by has disappeared in the mirk of the night. Each keeps within sight of his fellow on the right hand and on the left. So they stretch, a living link of the prime of British workmen, all the way from Euston station to Ballater in the far-off Highlands.

Even these elaborate precautions do not satisfy the anxiety of royalty's guardians. It will be seen that the line on which the King travels is kept under surveillance for at least ten miles ahead, the distance at which the pilot engine leads the way. But there is the possibility that a train passing southward as the King journeys northward may break down within the limit of this jealously guarded ten miles and obstruct the parallel line. The contingency is met by a simple peremptory edict. The up rail or the down parallel with that on which the King's train runs is temporarily devastated of traffic, not only at the actual hour the royal train will pass but for a precedent interval. For thirty minutes before it is due to pass a given point, no engine, train, or vehicle is allowed to proceed along or across the line. Heavy traffic is temporarily paralysed, it being decreed that for a similar period all shunting operations on lines adjoining the main road must be suspended.

When, in the early days of Queen Victoria's journeys to Scotland, these rules were drawn up, it was ordered that no trains or engines might be allowed to travel between any two stations from the time the pilot engine was due until the royal train had passed—that is to say, for a period of fifteen minutes. This regulation proved a little too drastic even for so loyal a body of men as those who sit at the board of railway direction. The order was modified by an exception in favour of passenger-trains and of fish-trains, with respect to which a special arrangement is made for rapid unloading at the termini. Obviously, it would be a serious thing for a train laden with cod and soles to be pulled up for a bad quarter of an hour whilst Billingsgate, only partially succeeding in mollifying the language of its commentary, was waiting for the contents.

But whilst these trains moving southward are

allowed to come between the wind and the King's regulty, the drivers are enjoined when approaching asy point towards which the royal train is advancing to bring their trains, whether containing fish or passengers—soles or souls—to a speed not exceeding thirty miles an hour. Moreover, they must refrain from steam-whistling when anywhere near the presence of royalty. Drivers of trains standing in sight waiting for the passage of the royal train must, on pain of instant dismissal, prevent their engines from blowing off steam or whistling. Ordinary traffic is finally paralysed by the bolting and padlocking of all facing points

or switches over which the pilot engine and royal train pass. As for the gates of level or grade crossings where there are no gatekeepers, they are locked one hour before the royal train is due, the county roadside traffic meanwhile getting along as best it may. Finally, the public are studiously kept out of any station at which the royal train may stop to take water or other refreshment.

Thus, over a desolated railway track, through barricaded stations, past a living hedge of ablebodied workmen, His Majesty King Edward VII. securely travels between his pleasure-houses.

THE LORD OF THE MANOR.

CHAPTER V.

ARRENER strode along by the side of his companion in silence. He was not in the least sorry for what he had said; he felt no dismay that he had angered Angela. He did not fail to recognise her good qualities,

www he blind to her faults. After all, it was a wish and useless life that she was leading. And, ann, it was one thing to be Miss Castlerayne of The lowers, but it would be quite another to be the anghter of the late Rayne Castlerayne. What wald the girls do when they had to leave their mostal home! These things troubled Warrener. is the same silence they walked down the garden, rih the house behind them. It stood out sharply the moonlight like a nocturne—gray, graceful, ithresque. The air was heavy with the fragrance the roses. Nothing was needed to make the Marcane complete. But all that Warrener could see or was the hollowness of it all.

A restic bridge led from the garden to the fringe the Common beyond. Something white flittered the gone, and Warrener made out the forms of and Gertrude and May. The upland slope was eler and saffron in the moonlight.

What a glorious evening! May cried. 'Posiinly it is a crime to go in yet. I am going as far it he pines to look at the sea.

Won't it be rather damp?' Miss Castlerayne

bit May waved the suggestion aside. With a accord they turned their faces to the slope, They came at length to the belt Ping Between the rugged boles and the shadow the silver-gray of the sea. Far beyond the is a light flashed from time to time. The cold aty of it all kept the little party silent for a te It was May who spoke first.

let us go round by the hospital, she suggested, ed over the headland, and so home by way of the

he heary flow of the sea glittered and flashed in and prove of the sea glittered and manned to socialish. Work and bustle and the fret of

life seemed wonderfully far away. A dull light moved in one of the windows of the hospital, and a door opened. A faint moan came like a jarring note on the air.

'Somebody is ill!' May exclaimed. 'They are trying to get Craggs up. It looks as if Mrs Masters was having one of her bad turns.'

Craggs emerged into the moonlight presently. Evidently he had just tumbled out of bed. He was listening with patience to what his visitor had to say. The angel of mercy was no more than a child, a little girl with a mass of shining curls.

'Granny's bad,' she said simply in reply to May's questions. 'She has some of her pains again; and she wants Dr Marfell.'

'Then you go back to granny, and say that Dr Marfell is coming,' May said .- 'I know exactly what is the matter with the poor old thing. A little brandy and a mustard-leaf is all that she requires. Aunt Gertrude, let us go and get the medicine.

'She's really bad this time,' Craggs explained. 'I saw her last thing to-night. Always was a bit of a grumbler was Martha; but to-night she's suffering terrible.'

'We'll fetch the doctor,' Warrener volunteered. He turned to find that Miss Castlerayne and May had already vanished .- 'Will you show me the way, Miss Angels?

'It is on the way home,' Angela explained. 'We might just as well take that path as any other. Mrs Masters has a wonderful recuperative faculty.

The girl shrugged her shoulders slightly and led the way. Evidently she had but little sympathy with the sufferings of Mrs Masters. Also, she was not disposed to amiable conversation. She carried her head still higher in the air. She pointed presently to a pretty white-creeper-covered cottage, and intimated that here was the residence of Dr

In response to Warrener's ring a little man came to the door. He was short in his manner. His white closely cropped hair stood on his head like a scrubbing-brush.

'Who are you, and what do you require?' he asked .- 'Good-evening, Miss Castlerayne. Hope there is nothing wrong, for I'm dog-tired. Out for two nights in succession, out all day to-day, and no food since breakfast.'

'It's at the hospital,' Warrener explained curtly. He rather resented the shortness of the other's manner. 'A Mrs Masters, I believe. If you will be so kind'-

'I won't be so kind,' the doctor cried. 'I don't know who you are, sir, but I decline to be ordered about in this manner. And as to that old woman, I tell you plainly that there is nothing whatever the matter with her. Besides, why should I work for nothing? I'm supposed to be doctor to the hospital. I'm supposed to get a fee of thirty guineas per annum to look after the health of these people—that is supposed to be Mr Castlerayne's affair-and not one penny have I had for the last eight years.'

The words sounded rude enough; they were abrupt to the verge of brutality, and yet there was nothing of the savage in the little doctor's expression. There was even a suggestion of a humorous twinkle in his eyes. And Warrener could not know that here was a man who worked hard for a poor pittance, and who never listened unmoved to a story of distress. Perhaps he was too familiar with the idiosyncrasies of Mrs Masters.

'I am sorry to disturb you,' Warrener said coldly, 'but I am under the impression that the poor woman is really ill. Samuel Craggs says so.

'There, don't be huffy,' Marfell cried. 'How would you like to be dragged away from your first meal to attend an obstinate old woman who will eat nuts when she has been told over and over again that they are not good for her? Not that I withdraw a single word as to my longbelated fees, and my giving up my one luxury, my cigar, to keep my boy at his London hospital. I'll go.'

'I shall be very happy to pay your fee,' Warrener

'You pay my fee when I ask for it,' Marfell snapped. 'Confound the old woman !- Miss Castlerayne, I'm positively ashamed to have so far forgotten myself in your presence. It was very wrong of me.

'An apology is hardly necessary, Dr Marfell,' Angela said coldly. 'I dare say'-

'My dear young lady, I am not apologising,' the doctor cried. 'The way I am being treated over the hospital fees is disgraceful. I have told your father so. I am a great fool not to have put him in the county court long ago.' Without another word the speaker bustled away up the path below the rolling gorse.

Warrener could see that the face of his companion was flaming with shame and anger.

'You must not take Dr Marfell too seriously,' she said. 'He is really one of the best and kindest of men. He has been known to give his own dinner to a poor patient in need of a meal. And, really, old Mrs Masters is a confirmed grumbler. Shall we get along a little faster? It is very late.'

Warrener increased his pace as desired. On the whole, he was not sorry to see Angela lifted from her lofty pedestal in this way. It was all very well to be a Castlerayne of Castlerayne Towers, but less exalted people might have questioned the honesty of that distinguished family. And Warrener had gone through all that in his younger days. But there was a lesson in store for Angela.

In the porch of the house Rayne Castlerayne stood. He looked quite the patrician in his evening-dress, the typical master of broad acres; also, he was smoking a cigar of most excellent quality.

'Where have you all been?' he asked. 'It is past ten o'clock. Angela, your aunt and May have gone out again on some ridiculous errand to the hospital. Somebody ill, or something of that kind. Really, those poor people are most inconsiderate. They wait till the very last thing at night, and then think nothing of keeping everybody up for hours. Why could they not have sent for Marfell?'

'They did,' Angela said with a vexed laugh. 'Mr Warrener kindly went for him. And he was most rude. He volunteered to Mr Warrener, who is a perfect stranger, that he had had no fees in reference to the hospital for eight years, and that he was very foolish not to have put you in the county court long ago.'

No glow of shame tinged the cheeks of the listener. On the contrary, he smiled as if some-

thing amused him.

'Capital fellow Marfell, when you know him, he said with a faint air of patronage. 'And, upor my word, it really is time I paid that hospita The same remark applies to man; account. others of those tradesmen's bills.—Come and have a cigar, Warrener. I have a new sort down from London to-day; a little expensive, but an excellen cigar.'

Warrener declined the tempting offer. If hi host would excuse him, he would go along the Common again and meet Miss Castlerayne comin back.

They came presently with the information the the patient was really ill this time, and that I Marfell had promised to stay for some time. Mi Castlerayne laid a detaining hand on Warrenes arm, so that May might precede her into the hous She looked white and anxious.

'Why does the matter trouble you so?' Warren asked.

'Because I am to blame,' Miss Castlerayne sai 'Dr Marfell says that the symptoms point to typho fever. He has told me over and over again to ha the drains at the hospital thoroughly renovated

he had threatened to report me to the authorities : and I have not the money. I actually sold some jewellery to find the money for Cragge. It is a dreadful thing that I should be conspiring against my own family in this way, but what can I do? have exhausted my little capital on the hospital. I dared not let those poor people want. They look brward to the hospital for their old age as a sacred night, which it is; and now I have nothing further w give them. It is useless to approach my brother, for the simple reason that he has practically nothing broud his debts. If he were not Rayne Castlerayne of The Towers he would have been sold up without meny years ago. Oh! I am tired and weary of his kind of pride-pride that lives on other people's credulity, and which revolts from the idea of making the place a paying property. That is why I flung a my lot with Cragge, why I pray that he should but my brother and bring us prosperity. I hate that hotel idea myself; but what can we do? And tow it is absolutely necessary to spend at least four hundred pounds on the hospital. If it isn't done I shall feel like a murderess.'

'Let me do it,' Warrener said eagerly. 'Let me find the money. And permit me to have the pleasure of advancing the necessary funds to keep the hospital going. It is only for a time. Believe me, you can repay every penny later on if you like. Am I mistaken in understanding that under your father's will a certain portion of the income of the estate comes to you?'

'Eight hundred a year,' Aunt Gertrude said with a faint smile. 'Which is just twice what my brother's revenue amounts to. The mockery of it!'

'Not at all,' Warrener said coolly. 'You shall have your income. The great conspiracy is going to be successful if it costs me half my fortune. But there will be a sharp lesson first, and Angela shall have her share of it. It will be exceedingly good for Angela.'

(To be continued.)

ORCHARDING IN NOVA SCOTIA.

By R. F. DIXON.

HE maritime provinces of Canada, owing to the tremendous rush to the North-west, are under a temporary cloud. Half-forgotten by the people of the rest of this continent, and

almost wholly so by the British peblit, they would seem to stand for everything hat is backward and unprogressive. People think them as communities that have seen their best his and that have no future before them worth peaking of. They lie in the backwash of the resten rolling tide of immigration, and, if not stully drifting back on their course, they remain it best in a sort of negative condition, holding her own with difficulty, or, if perceptibly advances at all doing so at a pace outdistanced, or all events equalled, by the most conservative wiffer communities in the Old World.

and yet, more than half-true as this is, it is chiul whether there is a region in North therica which offers so many and so varied coings for the investment of capital and as the attractions as a place of residence or settleas the good old province of Nova Scotia. is the extent and variety of its natural resources an challenge favourable comparison with any province in the Dominion, and, it may be sided with any single state in the Union. Its fabries are probably unsurpassed by in the world; its vast areas of coal and iron to be effectively worked) in those of Great Britain; its fruit-lands produce bet hard 'keeping' apples on the continent; great forests of spruce, pine, and birch, and or virginis suitable for lumber or pulp, extend over hundreds of thousands of acres. Nearly all the commoner metals are found in paying quantities. Gold is profitably mined in many parts of the province, and the industry is only awaiting the investment of sufficient capital and the application of up-to-date methods to make it, in the opinion of experts, as profitable as quartzmining in any other part of the world. The country is, moreover, well adapted to ordinary mixed farming, as carried on in Great Britain. When we consider, in addition to all this, the peculiarly favourable position of Nova Scotialying as it does in closer proximity to the European markets than any other region on the continent-and the existence of its many noble harbours, the truth of what at first might appear a somewhat wild statement begins to become apparent.

While, of course, the vast prairies of the northwest provinces, with their 'magnificent distances' and practically illimitable wheat-growing areas, offer, and will continue to offer for many a day to come, overpowering inducements to the enterprising young Briton, Nova Scotia as a field for a certain class of settlers possesses advantages that, taking it altogether, it would be hard to match in any other portion of the Dominion. refer especially to fruit-raising, which can be carried on in this province under almost ideal conditions. A pleasanter life than that of the Nova Scotia orchardist it would be difficult to conceive for any one not hopelessly enamouredas some young Britons unfortunately both for themselves and the country are—of the joys and delights of the 'wild life' of the West.

Orcharding in Nova Scotia has of late years risen almost to the dignity of a science. The old, wasteful, hap-hazard, rule-of-thumb methods have been very generally abandoned, and apple-growing is rapidly entering upon a new era, in which it bids fair eventually to become one of the learned professions. The 'off' and the 'on' years, when enormous and exhausting crops alternated with absolutely lean years, and the prices correspondingly fell to zero or rose to famine height, are now almost things of the

Orchards are now being managed in such a way as to secure moderate and lucrative annual crops, and apples in an increasing number of cases are being produced with almost the regularity of the output of a factory. Prices are consequently acquiring a comparative stability like that of the great staples. At all events, the range of their fluctuation in price is being gradually contracted, from the time when the year in which they could not be given away was followed by that in which they could scarcely be had for love or money. This desirable state of things, the result of vastly improved and generally applied methods of pruning, spraying, and fertilising, has been supplemented by another marked advance in an equally important department of the industry. The system of apple storage has been revolutionised. 'Apple-houses,' in which great quantities of fruit can be kept at an even temperature for months, and shipped to the European markets according to demand, are springing up in all parts of the country. And, furthermore, in the vitally important matter of transportation great developments and improvements have taken place, which, however comparatively advanced, are as yet only in their infancy. The industry in all its departments is being every year increasingly run on strict business principles, and it is in this respect far ahead of farming, whose day, however, is most assuredly coming.

Orcharding in this province, as a means of immediate livelihood, requires capital, the limit of which I may place at fifteen hundred pounds (seven thousand five hundred dollars). This is the sum in my estimation sufficient to start a man as a fullfledged orchardist-that is, for the purchase of an orchard of, say, three hundred trees in full bearing, with a dwelling-house. An orchard of this description, properly managed, should yield an average income of from one hundred and eighty pounds to two hundred pounds per annum. Properties with more or less productive orchards, provided with comfortable dwellings, may be bought for considerably less than the sum I have mentioned, where farming may be carried on in conjunction with fruit-raising. For this eight hundred pounds or one thousand pounds, and even in some cases considerably less, would suffice; but prices vary considerably in the orchard region of Nova Scotia. I know some large properties, beautifully situated some little distance from the railroad, that could be had at much lower figures.

I do not, however, recommend the joining of farming with fruit-raising. Farming is a profession in itself, much harder to learn and infinitely more risky than fruit-raising. In no occupation is money literally 'sunk' so easily and hopelessly as in farming. The farm eats up the orchard. I would, therefore, strongly dissuade Old Country men from attempting the combined occupation, which, though no doubt carried on with fair success by some of the 'native born,' is almost certain in their case to end in disastrous failure, as a very large number of cases that have come under my own personal observation most conclusively tend to prove. It is so much easier to lose money in farming than in orcharding. Fruit-raising, though now, as I have shown, almost reduced to a science, is much easier learned than farming. A man possessed of average judgment and common-sense can with a very slight preliminary training take hold of an old-established orchard in full bearing and make a living at once. Fruit-raising is a stereotyped process. It consists in doing exactly the same thing in the same way over and over again. Farming, on the other hand, is never the same thing two years together. Emergencies are continually arising which tax the experience and the judgment, and for which there is no precedent. What may be the only safe course at one time may be the height of folly at another. And then farming involves a much greater outlay than orcharding in running expenses and upkeep. While your trees remain with you year in and year out, your crop and stock are continually coming and going, and their renewal is a periodical drain upon your resources, which must be met as the seasons come round.

The apple-raising region of Nova Scotia comprises the district rather vaguely known as the Annapolis Valley, which, roughly speaking, begins at the old university town of Windsor and ends at the pretty little town of Digby. The distance between these towns is about ninety miles, and the average breadth of the 'valley' may be reckoned at about seven miles, giving it an area of, say, six hundred square miles. Nearly every acre of the Annapolis Valley is eminently, and perhaps exceptionally, suited for apple-growing. Apples of the best qualities can be, and are most undoubtedly, raised all over Nova Scotia; but in no district do they take so kindly to the soil and climate with such uniformly good results as in this beautiful region, which has been called by an eminent horticulturist 'the home of the apple.'

It is in the production of hard 'keeping' apples that Nova Scotia especially shines, of such standard varieties as baldwins, golden russets, nonpareil, king of tomkins, falawater, Rhode Island greenings, &c., which will retain their flavour and freshness as late as April and May, and are often quite palatable long after midsummer. Cases are on record where some of these varieties have been kept in

fairly good condition for fifteen months, and the keeping of apples over from one season to another is quite common. These, of all kinds of apples, can be the most profitably handled, as they can be held for months for a rising market, and need not in any case be sacrificed at the opening of the season. They are the true apples of commerce, and worth accomparably more than the finest varieties of 'soft' fruit, which must be marketed in a hurry and for whatever price that can be obtained. It is a well-known fact that the farther north any kind of fruit, grain, or vegetable can be successfully nised the better and more durable the quality. Grown in a cool, moderately damp climate, in which there is a strong infusion of sea-air, and in a soil that is both 'heavy and light,' a sort of gravelly clay, and which seems exceptionally adapted to its healthy and rapid development, the Nova Scotia apple, like the 'No. 1 hard' wheat of Manitoba, is commercially the king of the 'king of fruits,' and ban handling and change of climate better than my other apple that crosses the Atlantic.

Before purchasing an orchard and going to work, at least two years should be spent in acquiring some knowledge of the conditions. Even more important than this is the necessity for guarding spinst the imposition of an exorbitant price. Most Old Country men who in my experience have come to grief in Nova Scotia as farmers or fruit-raisers have been wrecked on this rock. They have purchased good properties, but have crippled themselves from the start by paying from 25 to 50 per cat too much for them. I have known many instances in my residence in this country where Toung Englishmen have not only expended every dollar of their available capital but have borrowed money on their newly acquired properties sold to isem at a price far above their real value. They are thus started hopelessly handicapped from the ins, with a mortgage drawing 6 or 7 or even 8 per can eating like a cancer into their property. The ad in every case has been the same. The farm, acumbered with the mortgage and accumulated charges, has been sold at its real value—say, 25 per cat below what it cost—and the unfortunate seller as found himself, after squaring up, minus his equal, his property, his 'improvements,' and his ine, and face to face with life with a stock of aperience too dearly bought, and bought too

One cannot, therefore, too earnestly impress upon the propertive British orchardist the vital importance of caution in this initial step. The advice of periody disinterested people should always be freely said. It is important to remember in connection on this that the opinion of neighbouring landwars is always apt to be biassed. They are saidly anious to keep up the price of land in ker own vicinity, and to be able to say to some propertive purchaser, 'That farm sold for so much, and sine is just as good.' The opinion, therefore, a same one or of several neither directly nor in-

directly interested in keeping up the price of land should be always taken. Our Nova Scotian farmers are thoroughly good fellows, and for a law-abiding, moral, kindly, hospitable race their superiors, I am convinced, cannot be found in any English-speaking community; but they are no more proof against the temptation of over-valuing their property than are any other class of people. A man always gives his landed property the benefit of the doubt; for the sale of land, unlike that of every other saleable commodity, is not regulated by free competition, and so as long as the world stands, or as long as the institution of private property in land endures, people will continue to overestimate what to them has a unique and undefined value.

This two years' experience on a fruit-farm should. if possible, be obtained in the capacity of a hired man. Board and lodging in exchange for such unskilled labour as the new-comer can supply can in almost every case be easily obtained. Not infrequently a small wage will be paid in addition. I strongly discourage the payment of fees for learning the business. Where a man gives his labour or receives wages, the employer is anxious to teach him to be really useful, so as to recoup himself. As a boarder he is very apt to be left to his own devices, and his chances of acquiring really useful knowledge and of learning how to do things himself are not so good as in the case of the former class, who must be taught to pay for their keep or wages.

After a couple of years' experience of the right kind a man should be able to start apple-raising on his own account. Provided he pays a reasonable price for his orchard there should be little risk.

In orcharding there is very little scope for making disastrous mistakes. It is a case of follow my leader. Everybody is practically doing the same thing; everybody prunes, fertilises, packs, and ships apples in the same way, for there is virtually only one way of doing them, and unless a man is bent upon some course of wild and weird extravagance he cannot go wrong. This I know from personal experience. Of course I am speaking of the technique of the business. Good native judgment is just as essential in this as in any other calling.

Apples, as I have already pointed out, have a uniform price. The question never is, 'What is So-and-so asking for his apples?' but 'What are apples worth?' Their marketing, therefore, like that of lumber or wheat or any other of the great staples, is a very simple operation. The price is decided for you, and you can take it or leave it. Apples on these terms can be sold to buyers who scour the country during the season, or they can be shipped through the agents of the great English fruit-dealers, who take full charge of them the moment they leave the growers' hands.

All the small fruits of Great Britain can be successfully raised in Nova Scotia. Plums, in

spite of the prevalence of the 'black knot,' do exceedingly well, and are grown profitably all over the province. Pears of almost every variety come to perfection, and can generally be sold to advantage. Certain kinds of early and hardy peaches also do well. Grapes, with the exception of two or three varieties, have not as yet proved a success. Cherries do magnificently, and are grown in great profusion in certain districts. Better strawberries in any essential respect cannot be grown the world over. This may also be said of currants, gooseberries, and raspberries.

All the British vegetables come to perfection in Nova Scotia, and several other kinds not so commonly found there, such as tomatoes, cucumbers, and squash. Potatoes take very kindly to the soil, and are an important article of commerce with the West Indies. Indian corn often ripens in Nova Scotia, and always attains sufficient growth

for table use.

The life of the fruit-grower in the Annapolis Valley, so far as the comforts and reasonable pleasures of life go, leaves little to be desired. He lives amid delightful scenic surroundings, in an excellent climate, temperate, bracing, and sunny, among peaceable, kind-hearted neighbours of his own speech and blood, under British laws and institutions. He is well within ten days' journey of home, and two of Boston, New York, and other great American centres. All the modern comforts are easily attainable—telephones, house-water service, heating, &c., and a daily mail and daily newspapers. The educational advantages are excellent. Besides the primary schools in every

rural section, there are at Wolfville and Windsor respectively two chartered universities (Acadia College and King's College), and four boarding-schools for girls and boys, all in the highest state of efficiency. At Halifax, about sixty miles distant is Dalhousie College, carried on under the auspices of the Presbyterian Church (a most admirably conducted institution), also a flourishing girls' school and several boys' schools.

Excellent fishing can be had within reasonable distance of any part of the 'valley,' and a little farther off good partridge and duck shooting. Still farther off the lordly moose, the monarch of our forests, can be hunted with fair prospect of success, and occasionally the caribou, an ex-

ceptionally shy animal.

I may say, in conclusion, that Nova Scotia offers some inducements worth considering to the practical farmer of small means. A man who thoroughly understood farming, and who could command a few hundred pounds, might in my opinion go farther and fare decidedly worse than in Nova Scotia. Farms of several hundreds of acres, with good buildings, in close proximity to good markets, and in an excellent state of cultivation, can be purchased very cheaply in all parts of the province. Such farms could be gradually turned into orchards. But this is a matter that cannot be satisfactorily treated of within the limited space at my disposal, and all I can say on this head is that in my opinion it would pay an intending settler who had a practical knowledge of farming to take a run through the province before going farther west.

THE BAD LUCK OF KAPTAN HOLAR.

By J. J. BELL.

HE Norwegian steamer Ole Bull, carrying seven hundred tons of coal and sundry stores from Leith to her company's hvalstation on the northeast coast of Iceland, was jogging past the Faroe Islands at her average

speed of nine knots. It was eleven o'clock on an evening towards the end of June, and had the weather been clear the sun would have still been visible in the north. A wet fog blanketed the Faroes, some six miles to port; only the strange peaks of Fugloe and Svinoe loomed dimly above the vapour-bank. On the sea, however, the fog was thinning, and the captain of the Ole Bull sighted the little whaler in time to avoid the necessity of an abrupt change of course. He spoke to the man at the wheel, and telegraphed an order to the engine-room.

The engines were slowed, stopped, and reversed a couple of turns, and the Ole Bull came to rest within hailing distance of the whaler-steamer Gisli, which was wallowing idly in the heavy oily swell. The captains—one on his high, narrow bridge, the other in his little, square steering-box—bawled cheerfully across the water. They were old friends from Tonsberg, but their courses seldom met or crossed during the whaling season.

'It is a lucky meeting, Bjarni,' the captain of the Ole Bull shouted, after he had asked concerning the Gisli's recent hunting and got an unsatisfactory reply. 'I bring you luck. I am glad I met you. It is not ten minutes since we sighted a cachalot.'

The young captain of the Gisli fairly jumped. 'Cachalot!' he yelled. Then, 'You are sure?'

'Do I not know a cachalot when I see him? His head—his rising—his spout? And he was going slow—very slow—south. And he was the biggest'——

But the young captain was already giving orders to his crew and calling down the tube to his engineer. He waved his hand to his friend, bawled his thanks, promised a merry meeting at Tonsberg in October, and turned to his business. For the achalot is a rare visitor to these waters, and is worth several large rorquals-the 'finner' whales on which the Norwegians make much war and some profit; and young Kaptan Andersen had never yet had the fortune to encounter such a

So the Ok Bull resumed her journey north, and the Guli went dancing south, her thin black funnel belching smoke, her eighty-five feet of deck quivering Kaptan Andersen sang softly as he inspected the gun in the bow, ready charged and loaded with the big bomb pointed harpoon. His was good luck indeed! Good luck to have met the Ole Bull; good lack that the cachalot should appear at a time of year when there was no dark night. A little more good luck, and the prize would be his; for the wather was clearing quickly; the man in the crows nest had the eyes of a hawk; the sea, though welling, was smooth; and he did not doubt his own skill with the gun. Good luck indeed! He repeated the words aloud.

It is bad luck, kaptan,' said the voice of his irs mate behind him. The man, who had just ome on deck from his bunk, spoke sadly and

Kaptan Andersen wheeled round.

What is bad luck?' he asked sharply. Then he largied pleasantly. You have broken your coffeemng again, Holar; that is the trouble."

Holar shook his head. He was a big man, koking much older than his years, and melancholy of countenance; often he seemed to be brooding over some tremendous disappointment.

have broken nothing, kaptan,' he said slowly. Neither have I been dreaming dreams. But I tell out is bad luck to get news of a cachalot from Luptan Bjornsen of the Ole Bull.'

So you have heard about the cachalot. Well, Holar, I say to you that any news of a cachalot, then we have been a week without even a sej-hoad, spudluck; and when we have killed our cachalot

Kaptan, said the other solemnly, 'you will not mni this cachalot ?

indersen stared at his mate. What foolish it is this, Holar, about bad luck and Kaptan men! he demanded impatiently. He was on the older man, to whom he had allowed makenble latitude of speech in the past; but the going too far. What kind of talk is this

The mate's gloomy gray eyes looked straight the captain's angry blue ones.

It is for your sake, kaptan, that I speak what a call foolishness,' said Holar quietly. 'Will a listen, kaptan ?

Wat is it?' Andersen rapped out. His eyes The now turned to the sea ahead. log have heard, began the mate in a low

oz, that I also was once a kaptan of a

lare heard, Holar, said Andersen more

gently. 'You had bad luck when you were hunting from Finmarken. Was it not so?'

'It was bad luck,' continued the mate-'bad luck such as has never happened to a Norsk whaler since old Svend Foyn showed us how to take the great blaa-hval with the bomb-harpoon from the little steamer. My steamer, the Ulf, was sunk by a whale that I had struck and made fast.

'I know it, Holar.'

'Every one in Norge knows it, for such a thing never happened before or since. But every one does not know that the whale-the last whale I hunted, I who have killed hundreds-the whale was a cachalot.'

'Ah!' said Andersen, 'I had not heard that.'

'It was twelve years ago.'

'So you think it is unlucky to strike a cachalot, Holar,' said the captain, suppressing a smile. 'A goodly number of cachalots have been safely taken since then, and nearly all from the small boats?

'The ill-luck is not in the cachalot, but in the way the cachalot is found. Listen, kaptan. Twelve years ago I was cruising for blaa-hval and fin-hval and Nordkappers, and getting few of any. And on a night such as this a steamer going to Tromsö came a little out of her course to tell me about a cachalot-a big bull-that was not four miles away. The steamer was the Helga.'

'Not the Ole Bull,' said Andersen, turning to

him with a light laugh.

'No; but the Helga's kaptan was Kaptan Bjornsen, now of the Ole Bull.

The captain of the Gisli uttered an exclamation. 'That is queer, Holar,' he admitted presently; 'but it means nothing.'

'Nothing but bad luck,' said the mate stolidly.

'For me?' asked Andersen with a short laugh. 'For you, kaptan. There is no luck for me now

-neither bad nor good,' Holar muttered sadly. 'But I would not that you should ever be as I. It is not good to be second after one has been first. It is not good to see another fire the gun. It is hell. And so I beg you, kaptan-you who have forgiven me much and been patient—to let this cursed '-

'Hval! Hval!' came the alarm from the man in the crow's-nest.

Kaptan Andersen gave a shout of satisfaction. The whale, however, had risen far away, and the chase, in the meantime, would be directed from the masthead.

'Let him go, kaptan; let him go!' the mate pleaded. 'Do not risk everything.'

Once more Andersen laughed. 'It is doubtless the very cachalot that sank the Ulf, my good Holar,' he said jestingly.

'It is no other,' said the mate in a hoarse whisper.

Somehow Andersen did not laugh this time. He was afraid of no whale in the sea, but he was troubled about his mate. Was the latter getting a little mad?

'It is surely a strange happening,' he said after a pause. 'But how do you know it is the same cachalot? It is likely that your cachalot died in the Arctic.'

'I shot him badly—too near the tail. He got a coil of the cable round his flukes, and the cable went snap as if it had been wool. Then he went mad and came for the *Ulf. Nej*, kaptan, he lives yet; and there is now a devil in him that entered with my harpoon. Let him go, kaptan; let him swim away to the south, to his '——

'How can you tell he is the same?' Andersen interrupted irritably. 'How would you know'——

'On the crown of his great head there is a large, whitish blotch. It is like the map of Island [Iceland] on the chart, the shape of it.'

'Good!' said Andersen. 'I will look for it when the time comes,' he added firmly.

'And you will find it, kaptan,' returned the other in a dull voice. He perceived that nothing he could say would move the young man from his purpose, and he turned away, for it was time to relieve the man at the wheel.

'Stay!' the captain called, his voice gentle again.

Holar halted.

'See here, my good Holar,' said the captain.
'Suppose that yonder cachalot is really your old enemy. What then? Has not the day come for your revenge? Think of that, and cheer up!'

'My revenge! What have I to do with it?' asked the mate moodily.

Andersen flushed with anger, and turned again to the gun. It was not his fault that Holar was serving in a secondary position. It had always been a trial, his shipboard relation with a mate old enough to be his father. He had borne with the old man for three seasons, but he was coming to the end of his patience. Holar, with his grievance that insinuated itself into half his conversation, was becoming unbearable.

And now Kaptan Andersen thought he saw through the old man and his cry of 'bad luck.' The old man had pretended that his anxiety was all for his skipper and his skipper's reputation. So! And what would the old man do if he were suddenly put in the skipper's place? Would be let the cachalot go? Andersen muttered a curse or two, reviling himself for his previous indulgence to his mate. And an ugly question leapt up in his mind: could he even trust Holar in the steeringbox when the Gieli and the cachalot came to close quarters?

He looked behind him, but the mate had gone aft. A couple of sailors were standing at their posts beside the winches carrying the cables, to one of which was attached the harpoon. But he did not send a sailor for the mate, as he thought of first doing. The Gisli was still far from the cachalot; she was taking a curved course that

would eventually, if the lookout's calculations were correct, bring her close and at right angles to the whale's line of progress and somewhat in advance of the whale, there to await his approach. There was, therefore, no immediate need for the gun.

Kaptan Andersen went aft. In the steering-box he found the second-mate, who informed him that Holar had gone below, promising to return to take charge in a few minutes. At this Andersen's resentment was not lessened. The old man had taken one liberty too many. What could he be doing below at such a time?

The young man went into the tiny deck-house and quietly descended the narrow stair. At the last step he halted and peeped into the cabin.

The mate was sitting on his locker, crouching over the table, his face bowed on his arms.

'Holar,' said Andersen sternly, 'are you asleep? It is time for you to take the wheel.'

With a start the mate rose, squeezed past the captain without look or word, and climbed the stair.

Andersen entered the cabin, feeling uneasy. A crumpled, closely and badly written letter was lying on the locker. He picked it up, and ere he knew what he was doing these words were ringing in his mind: 'You must not give up hope, dear husband. Would not the young kaptan who is so kind speak for you to the company?'

Andersen dropped the letter and sat down on the locker. His wrath died; pity rose again. He began to understand something of what the ex-captain must have suffered during his twelve years' mateship; something of what the old woman at home must have endured as year after year went past without restoring her husband to the position that had seemed so grand to them both. And twelve years without firing a harpoon! Perhaps that appealed to the young gunner more than did anything else in the tragedy. Twelve years' blank on the top of, perhaps, twenty years' full existence, for Holar had been a famous gunner in his day.

Andersen felt sick of himself. He had pitied the old man, but had he ever really done aught to help him? Was he not a nephew of the largest share holder in the company? Yet he had never spokel a word on Holar's behalf—he, 'the young kapta: who was so kind!'

The second-mate summoned him, and he hurrie on deck.

'Take the wheel, and send Holar to me,' he sai briefly, and went forward to the gun. The un suspecting cachalot, after a long submersion, we coming leisurely towards the Gisli, and would mo probably cross her bows.

The captain signalled with his hand for 'der slow.'

Presently Holar stood beside him. The old may was trembling.

'You mean to strike him, kaptan?' he whispere

Andersen nodded. 'How could I go back to the sation and tell them I had let a cachalot go from mader my gun? Are you afraid, Holar?'

'For you, kaptan. You will lose your ship.'
Andersen bit off an oath. The old man's croaking
was maddening.

The whale came nearer, and suddenly Holar whispered, 'Look! See!—the whitish blotch on his head!'

'Ah!' The young man drew a long breath. He hid his right hand on the stock of the gun, and agasled with his left for a turn ahead. The spreme moment was nigh. Already he saw the Gui, with all her flags and bunting flying, arriving at the Farce healtation with the cachalot in tow; siredy he heard the managing director's praise and the congratulations of brother-captains.

The mate sighed, the sigh of a man growing old without hope.

Saptan Andersen stepped from the gun-platform.

"Bolar,' he said rapidly, 'I give you charge. Take
the gun—and your revenge. I go to take the
"bled. Good luck."

Holar went white as death.

'Are you afraid?' asked the captain.

'Ainad! But I think of you. What will they ar at the station?'

Oh, I have a little accident to my right hand,' relied Andersen. 'But now I have given you tour orders. Quick, Holar! Look out!'

Lite a boy, Holar sprang to the gun. His fee was still ghastly, but his limbs had become still.

Holar takes charge, said Andersen to the wondering salors, and ran aft to the steering-box, there to truthe instructions of his mate.

But Holar seemed mate no longer. With the Maked stock of the short swivel-cannon on his plan, he was captain in everything but name. The wide dreary years were blotted out in the joy all erulation of the moment. He signalled his seen without hesitation; he swung his weapon a its bearings with friendly familiarity.

The cachalot appeared to be half-asleep, so lazily id be forge through the water, his head with its scalar marking showing from time to time.

Swidenly the creature seemed as if he suspected inget. He moved forward with a rush. But ere a could sound, Holar's finger had pressed the state of the hundredweight harpoon and its four feet length in the great greasy flank. These with the crash of the cannon the awful tail state dots, and amid the roaring and foaming of the time of the state of the sta

In the tame of whirring and clanking wheels the picker benpen cable flashed from the winch and set the bow. Ninety fathoms poured into the sea set Holz gave orders to check the wheels with the static wooden brakes—lightly at first, then heavily set at last the cable ceased to flow, and the Gisli, so are at rest, glided through the water. Between

the wind and the bow the cable stretched, taut as a fiddle-string, a foot above the deck. Holar stood with one foot resting on it while he searched the sea ahead.

In seven minutes, perhaps, the cachalot rose. He had gone down with but half-filled lungs, and ere he broke the surface the carbonic gases burst from his blow-hole and carried a watery spout high in the air. Again he blew tremendously and sucked in fresh air, rolling from side to side, lashing out with his tail. The cable slackened ever so little under Holar's foot; but he felt the change, and immediately the donkey-engine went to work. Not for long, however. The cachalot set off once more, towing the Gisli at the rate of six knots an hour, and swimming at or near the surface.

In the steering-box Kaptan Andersen felt anxious. It was plain to him that the bomb on the harpoon had failed to explode. A long struggle was therefore likely, and it looked as if lancing would be necessary before the end could be reached. He glanced at the two small boats belonging to the Gisli, and shrank from the thought of risking his inexperienced men in them alongside an infuriated whale. It was a rare experience indeed to use the lance in rorqual-hunting-so rare that little or no provision was made for such an emergency. Andersen remembered that, a year before, three men belonging to an Iceland station had left the whaler to lance a wounded blaa-hval and had not returned. It almost seemed as if the 'bad luck' had come after all, and he could only hope that by some happy chance the bomb might yet explode, or that Holar, who was already reloading the gun, might somehow get a second shot home.

Two hours had passed, but the cachalot, though slower in his movements, was far from being exhausted. Several times, too, he had just missed getting a kink of cable round his tail, which would have ended matters so far as the company was concerned.

Forwards and backwards ran the wheels, as the cable was let out or hauled in, and once the Gisli was sent 'full astern' to overcome a sudden slackening.

Holar's eyes had become feverishly alert, but the colour had not returned to his face. The crisis had yet to come. He knew it. He dared not leave his post for a moment, otherwise he would have run aft to whisper a single sentence to the captain: 'Kaptan, it is for you more than for myself.'

Of a sudden the cachalot sounded.

'Steady!' muttered Holar to the men at the winch, who were ready to let out more cable. 'Hold on!'

He pressed his foot on the cable—once—twice—thrice.

'Full ahead! Hard astarboard!' he yelled. Beneath his foot the cable became elastic, then easy to bend. The deck quivered as the Gisli shot forward in a curve, the cable trailing from her port bow as though she were a stricken monster running away with the line.

A groan burst from Kaptan Andersen's throat. Had Holar gone mad? He opened his mouth to shout, when the second-mate at his side screeched and pointed astern.

There, from the shattered sea, burst the monstrous head; and, as the men gaped, the cachalot heaved his frightful bulk half out of the water and across the still bubbling track of the Gisli.

Down he went again, raising a tempest of spray and leaving a whirlpool of foam. And Holar laughed aloud, for he saw that the spray and foam were ruddy, and he knew he had beaten his enemy at the game of twelve years ago.

'Stop! Full astern!' he bawled. A minute later the cable was once more safely ahead of the

'Stop!' The cable went rigid.

'Half-speed ahead!'

At the same time the donkey-engine was set to reel in the cable at a moderate pace.

Fifty fathoms away the cachalot came to the surface in a fury, and blew fountains of blood skywards. The bomb had done its work after all.

The Gisli crept nearer, and Holar was again at

he gun.

The cachalot lashed out madly with his tail. Once he raised it as if to sound, but it fell with a futile thunder-clap on the crimson water. He lay still.

The Gisli crept nearer. Holar pointed the gun. He wanted to make sure.

Suddenly a convulsion seized the enormous bulk. It rolled over, exposing the gaping jaws, the shallow pointed under jaw with its row of great teeth, the cavernous upper jaw with its empty sockets. Then a shudder like an earthquake passed over it; then quietness. A flipper fluttered the surface feebly for a few seconds, and was still.

Holar took his hand from the gun. It was not required. On his side, almost completely sub-

merged, the cachalot lay dead.

'It is enough,' murmured Holar, and sat down

on the gun-platform, shaking painfully.

'Is he killed?' asked a young sailor, who had never seen a cachalot before. 'He still floats.' The young sailor was used to rorquals, and they sink immediately after death.

Holar did not appear to hear, and the young sailor, with a curious look, left him.

Kaptan Andersen came along and laid his hand on his mate's shoulder. Youth is humble once in a while.

'You were right, Holar,' he said. 'I should have lost my ship.'

Thirty-six hours later the cachalot lay on the flensing-slip of one of the Faroe hvalstations. Men were labouring on the carcass with keen curved knives, attached to six-foot handles, and sharp spades. Standing in two inches of thick yellow grease and inhaling an odour beyond description, Holar the mate waited impatiently while a couple of men delved deep into the carcass at a spot which he had indicated.

'Have you not found it yet?' he asked.

'Not yet. Ah, here are the barbs!' cried one of the men. 'I must get an axe. It is jammed in the ribs.'

Holar clambered on to the carcass and peeped into the cavity. He laughed softly, almost boyishly.

The man returned with the axe, and fell to work on the obstruction. Presently he and his fellow hauled forth a harpoon seemingly formed out of rust. They wiped it roughly with some waste.

Holar's eyes glistened. He gave each man a silver coin, and carried his prize towards the little pier against which lay the Gisli and another whaler that had just brought in a fine blaa-hval.

On his way he met the manager of the station coming from the Gisli.

The manager laughed very pleasantly. It was cheerful to have a cachalot and a sixty-barrel 'blue' on the slip yonder. 'What is that you carry, Holar?'

Holar laughed also. 'You did not believe me this morning when I said I had met the same cachalot long ago.'

'Ah, well, Holar, you know I hear so many wonderful stories from my whalers. And I have heard of marks on whales before too.'

The mate rested the barbs of the weapon on the ground and took out his knife. He carefully scraped the rust from the edge of the slotted shaft near its butt.

'Of course you know all the whaling companies' marks?' he said quietly at last. 'And you know the mark of the company owning the *Ulf*, which I—I lost twelve years ago?'

The manager nodded and made a sympathetic remark.

'Then, please, look at this,' said the mate.

The manager inspected the metal. 'Ah, so! It is the mark of your old Finmarken company. It is wonderful!' he said. 'Come with me to the house, Holar, and drink a glass of wine with me, so that I may swallow my unbelieving words of the morning.'

They went to the house together. The manager was truly in an extraordinarily gracious humour.

'You have heard that our company is building a new whaler for next season,' he remarked as he poured out the wine. 'It is perhaps a little early to drink to her success, but we will do so, and also to the health of her kaptan.'

'Kaptan Andersen,' murmured the mate, raising his glass. 'He deserves it. The new steamer and

Kaptan Andersen. Skaal!'

'No. Kaptain Holar,' said the manager, holding out his hand.

THE MONROE DOCTRINE OF AUSTRALIA.

By F. A. W. GISBORNE.

HE term 'White Australia' is, no doubt, fairly familiar by this time to the ordinary Englishman at home.

If brevity may be regarded as the soul of statecraft as well as of wit, the originator of the expression

extainly achieved a triumph. Inspired by his succes, others have attempted to increase the succes, others have attempted to increase the number of similar convenient catchwords whose utility in democratic communities the popular politician fully recognises. Australian papers and sariamentary speeches abound nowadays not only with references to a 'White Australia' but to a 'White Ocean,' and even—so daring, but lost ball sense of humour, have become our reformers—to a 'White South Africa' as well. One almost repressed towards a 'White Antarctic Continent' (140); possibly even a 'White China.' But these here not yet entered even our Labour Party's exensive domain of practical politics.

'White Australia,' however, is what an American rould call a 'live' question; and beyond a doubt the phrase gives crude expression to a policy which s dominant, with certain limitations, as much among the educated as among the uneducated classes of the great southern continent. is a general resolve that, so far as is possible, it wall remain the heritage of white men. No internal conflict of races, happily, now exists. The riginal British settlers in Australia were so fortenate as to find an immense habitable territory hing practically empty. There was no prolific he native to the soil, as in South Africa, to challenge the right of the invaders to enter into Mession of their new domains. The aboriginal thes were too degraded to be any serious source Atrouble, and they are rapidly dying out. Shielded The strong arm of Great Britain, the Australian chonies became populous and flourishing comamilies within the first century after their foun-Happily, the baneful system of slavery, at has poisoned the life-blood of America and ingless a coming convulsion to the inhabitants the United States, was never introduced into Isralia. The sword of retribution is not susand over her head, nor does she contain within orders a vast alien population that cherishes mories of ancestral wrong.

Nevertheless, in spite of her seeming security, a serict uneasiness has persistently lurked in the naise of all far-seeing colonists, and the cause of its disquiet the map reveals to us. Lying at the its disaid, australia has in her neighbourhood the see populous countries in the world. Territories or populous countries in the world. Territories in the world in the property of the world in the property of the world in the world in

desirable region that remains still to a great extent devoid of human life. The portions of that region, too, that lie nearest Asia are those which are least inhabited, and by reason of their climate and other advantages offer the strongest attractions to the people of the neighbouring continent. The latter may fairly argue that less than five million human beings in Australia have no right to the exclusive possession of territories as large as those which support five hundred millions in Asia; even if he require the manger, the dog is not entitled to appropriate the whole stable.

Fortunately for Australia, in the days of her infancy she was doubly protected against a whole-sale human inundation. The British fleet has guarded her, and continues to guard her, against the forcible seizure of any part of her territories. British rule in India has restrained some three hundred million Asiatics from emigrating to other portions of the Empire where they would by no means have been welcomed. The Malay race has ample room for expansion in the great archipelago to the north of the island-continent, and Polynesia is not sufficiently populous or advanced to threaten danger.

The Chinaman has throughout been the enemy most dreaded. In the days of the early golddiggings he and his fellows swarmed into Australia, and by diligent and objectionable industry gently shouldered the white working-man from many a profitable Tom Tiddler's ground. Returning home with their spoils, the first Celestial adventurers incited others of their countrymen to follow their example. It is by their mastery of the policy of 'pacific penetration' that the Chinese make themselves such formidable neighbours. They are not warlike. No Chinese 'Invincible Armada' is ever likely to disturb the peace of the Eastern world. But they are prolific, and possess qualities of industry and quiet tenacity of purpose which render their methods of insidious invasion trebly dangerous. Like the little monk of the Italian fable, they come first as suppliants, and then, if not restrained, take possession of the whole establishment. M. Huc tells us how, long ago, the Tartars of Manchuria and Mongolia were being gradually pressed northwards by hordes of Chinese cultivators, who continually encroached on their pasture-grounds. Similarly, in south-eastern Siberia to-day the Russians are striving vainly to check a similar pacific invasion.

We see, also, the Chinese becoming yearly more and more in numbers the dominant race throughout the Malay Peninsula and portions of the East Indies. Every year they are thronging in increasing numbers to the very threshold of Australia; and Australia, fearful lest the yellow stream

should flow farther southwards, has resolutely shut her doors and denied admittance.

Many years ago the possibility of a future vellow peril was foreseen by thoughtful colonists. Before the fear assumed legislative expression, the white diggers took summary measures to show the busy little yellow men, whose pertinacious activity gave such great offence, that they were not wanted. Forcible ejectment, without legal process, was practised on most of the diggings. Poor John Chinaman was not only forbidden in many cases to dig for gold; he might not cook, wash, or grow vegetables either. The writer remembers a case where a bank manager in a mining township was boycotted for weeks because he employed a Chinese cook, and was finally compelled to discharge him. Miners' law was soon strengthened by legislation, and in some of the colonies a heavy poll-tax was imposed on each Chinaman who entered the country.

A singular incident that occurred at Maryborough in Queensland some twenty-five years ago, when the writer first visited that colony, will show that the law was not allowed to be a dead letter. The steamer he was on was the only one on which Chinese were allowed to work; as, after a long strike, the company owning it and many others had been obliged to substitute white for yellow crews on all the rest of their vessels. An unlucky Chinaman ventured to take a stroll on the wharf. He was at once pounced on by a couple of Customs officials, who demanded payment of the poll-tax of fifty pounds. An animated but incoherent discussion followed, and it was only after much protest that the zealous functionaries yielded to the captain's contention that a wharf was not terra-firma, and that therefore no legal claim to the tax could exist. Poor John ever afterwards confined his excursions to the deck.

In spite of the stringency of the law and the strength of the sentiment it expresses, it is singular, by-the-by, to note certain inconsistencies in the attitude of many 'White Australia' advocates towards the races they denounce. In the course of a long period of residence in tropical Australia the writer observed again and again cases where the wives of white working-men invariably bought their requirements from Chinese stores in preference to European, on account of their cheapness. Their husbands, who, while blatant denouncers of the 'yellow vermin' so long as they worked for wages, often, when they had saved a little money and taken up land, engaged members of the despised race to work for them, leaving their white brothers to walk the streets unemployed. Many small selectors in the state referred to employ Kanakas and coloured men still, although a recent Federal Act has done much to discourage the practice by offering a substantial bonus to the producer of sugar who employs only white labour.

For a long time it was the law in Queensland that coloured men might only be employed in growing

tropical products. Humorous results often followed. A Kanaka caught digging English potatoes instead of sweet potatoes would bring his employer into trouble. Several unlucky settlers were heavily fined from time to time for the heinous transgression of permitting their coloured assistants to cut wood, milk cows, mend fences, and the like. A Kanaka or Chinaman might load a cart with sugar-cane, but he was not allowed to drive it. Naturally, regulations such as these were continually evaded. The movements of the inspectors were carefully observed, and whenever one of the class approached a selector's house the whole coloured staff would be found industriously engaged in hoeing among the pineapples or sugar-cane. After the gratified and refreshed official had left, the tropical agriculturists would be suddenly re-transformed into cooks, milkmen, woodcutters, and fencers again.

By the decree of the Commonwealth Parliament a 'White Australia' policy is henceforth to be rigidly enforced. Members of coloured races now living in Australia are, with certain exceptions, to be deported erelong to their native countries, and no more are to be admitted as permanent residents. If it be attempted to restore all the dusky settlers in Queensland, Western Australia, and the Northern Territory to the bosoms of their families at home, the officials charged with such duty will have a very embarrassing task before them. Including Chinese, Malays, Kanakas, &c., scattered over half a continent, some twelve or fifteen thousand unwilling emigrants at least will have to be collected, and an extensive fleet provided for their accommodation. Then will follow the yet more difficult question of deciding where to take them. The names by which South Sea Islanders know their islands are often quite unfamiliar to white men, and to land a Kanaka on the wrong island would mean frequently that the grateful residents would enjoy an unexpected feast. It is tolerably certain, however, that when the time comes saner counsels will prevail, and that even the wildest enthusiast for a 'White Australia' will hesitate to recommend the forcible expulsion, in defiance of the common law and of common justice, of thousands of innocent aliens. The ruin of great industries such as the pearling industry and, partially at any rate, the production of sugar would inevitably follow such an act of mad injustice.

To one who has some acquaintance with the conditions that exist throughout the tropical portions of the Australian continent, the fact is obvious that a rigid adherence to the 'White Australian' doctrine would mean industrial death to a large portion of its surface. It would, indeed, be an entire mistake to assert that the whole of the vast region north of the tropic of Capricorn is quite unfit for permanent white settlement. The mountains and tablelands there enjoy a climate admirably adapted to the European constitution, and there is hardly a locality throughout the continent where the writer met with men engaged in hard manual work more vigorous

and healthy than in the Herberton district of North Queensland. There, at an elevation of about four thousand feet above sea-level, in a latitude corresponding to that of Jamaica, a wholesome and delightful climate prevailed, very different from the enervating, steamy heat that made life at Cairns, on the coast, only forty miles distant, almost unesdurable during the summer months. The region of dry heat, too, embracing the vast inland plains, is quite fitted for pastoral settlement by white men. But the region of moist heat, the whole littoral from Keppel Bay in Queensland to King Sound in Western Australia, is not adapted to the constitution of a white race; and unmistakable signs of degeneration are now to be observed among the progeny of the early settlers on the northern mas. As in India and West Africa, conditions of stificial comfort are there essential to the maintenmee of health. Without these the healthy Europen working-man must within the space of a few years degenerate into a cadaverous, yellow, listless secures of his kind, quite unfit for sustained

The present policy of the Commonwealth Government of offering a substantial bonus to growers d signs who employ only white labour is likely, il persisted in, to lead to the deplorable result installimately the tropical coast-belt will become peopled by a race of mean whites, to support whom the independent cultivator of the temperate portions if the continent will be heavily taxed. Governments that often lavish large sums to improve their ined of horses, cattle, and sheep are scarcely conexent or wise in expending yet greater sums in rining their breed of men. It may be confidently seemed that, in regard to the tropical coast-lands of lustralia, if these be reserved exclusively for white Den, there are but two alternatives: either a large prices of the continent possessed of enormous tain resources will remain a wilderness, with here and there perhaps a cattle-station or miningbed; or the people in one part of the continent and be heavily taxed to promote racial deteriora-

There is, however, a yet more serious consideration to be taken into account. The filtration into latarilia of unwarlike races like the Chinese may be the checked by costly legislation, though there are other ways of entering a house than by the door; and the most vigilant patrolling of the sorten coast could hardly prevent the landing a coasional bodies of aliens when the centrifugal irras that result from congestion of population in assistancing countries become irresistible.

No hotile invasion, either, would be attempted to long as Great Britain retained the command is the sea and the Commonwealth continued to a province of the Empire. But if, like ancient kee, the mother-country should ever be completed to recall be legions and fleets from distant long from the mother country should ever be completed to recall be legions and fleets from distant authority and the legions are shattered, and the legions are shattered,

Australia's position would become exceedingly precarious. However populous and wealthy her southern states might then be, the north would certainly, if its development were prevented meanwhile by a fatuous course of policy, lie open to the attacks of an enterprising maritime people like the Japanese.

If the Commonwealth were an independent state to-day, and if, as would be only too probable, she gave wanton provocation to the Power that now ranks first in Asia and among the first in the world, it is indisputable that Japan could with the greatest ease occupy and annex any portion of tropical Australia that she pleased. The Commonwealth possesses no fleet, and modern armies cannot be marched across continents. Even if the transcontinental line from Adelaide to Port Darwin were completed, a campaign in the Northern Territory would be as difficult a business for Australia as the war in Manchuria has recently proved to Russia. Two thousand miles and more of coast affording hundreds of landing-places could not, however, be adequately protected against a powerful enemy by any naval or military force that the non-tropical portions of Australia will be able to maintain for the next century.

The via media, the path that promises both safety and prosperity, seems obvious. Brown races should be utilised as a barrier against the yellow. India affords a boundless supply of the class of labour that is exactly suited to the needs of a tropical region, and with her help a luxuriant wilderness might be converted into a wealthproducing garden. North Australia is peculiarly adapted for the cultivation of cotton. Sir W. Mitchell, a leading authority on the subject, stated some time ago that he never saw better cotton than that grown at Caravonica, near Cairns, in Queensland, and a large French spinner offered to take all that he could be supplied with at one shilling and sixpence per pound, a price far in excess of the ordinary value of American cotton. Expert opinion declares that the Northern Territory contains millions of acres of land of the finest possible description for cotton-growing.

Besides sugar (already grown to the extent of about one hundred thousand tons annually in Queensland), tropical fruits of all kinds, coffee, tea, rice, cocoa, cinchona, and many other such products have been experimentally grown with success. The introduction of Indian coolies under the indenture system that exists in British Guiana and elsewhere would confer a double benefit on both India and Australia. After his term of service had expired the coolie would be sent home with a sum that represented a modest fortune to him. The engagement of many thousands of labourers yearly would afford appreciable relief to the congested districts of India. But a comparatively short passage would be necessary to take the coolies to the plantations and home again, and freights would therefore be low. Climatic conditions are similar, and it would soon become a matter of indifference to the Hindu labourer whether he worked for an Englishman in India or for an Englishman in Australia. His right to fair treatment would be conserved by strictly enforced regulations, and there would not be the slightest danger of the growth of a system of disguised slavery.

Besides Indian coolies, a certain number of Kanakas, and perhaps New Guinea natives, might be engaged on similar terms. The former make excellent labourers; the latter, so far, have not proved very satisfactory, but no doubt they will adapt themselves to discipline and steady work as they become civilised. Orientals of a superior class might be admitted without restriction within the well-defined areas to which the employment of coloured races would be confined; but certain disabilities as to ownership of land, &c., might be imposed to check the abuse of this privilege. Under such a condition of things the gain to Australia would be enormous. Capital that now shuns the northern regions of the continent would flow in abundantly, and soon transform what are now waste places into populous and rich thriving centres of human industry.

The complete failure of the 'White Australia' policy as applied to the tropics is fully demonstrated by the lamentable history of the Northern Territory, which remains to this day a heavy burden on the revenues of the state that has throughout so grievously mismanaged it.

Even under the unsatisfactory conditions formerly attendant on the Kanaka supply in Queensland, the latter state, on the other hand, has greatly developed its tropical industries, though these are already beginning to suffer under the paralysing influence of the Commonwealth Legislature. The guarantee of a certain supply of suitable labour at reasonable rates, coupled with a liberal land policy and improvement and extension of means of communication-in particular, the speedy completion of the transcontinental railway-would soon transform the Cinderella of Australia into the princess. The Northern Territory could alone in a comparatively brief space of time relieve the Lancashire millowner and operative from all fear of a future cotton famine, and the Empire, so far as one at least of the prime industrial necessaries was concerned, would become self-supporting. White heads being required to direct brown and black arms, a large field for profitable employment would be provided for enterprising young Australians and Englishmen on the plantations, and they would be enabled to live under such conditions of comfort as would ensure immunity from the attacks of The shipping industry would be the climate. particularly stimulated, and the pastoralists of the northern plains, now completely isolated from the southern markets, would find profitable customers close at hand. The state, too, would draw largely increased revenues from the planting districts, and

would be able by defence works, and perhaps the creation of a fleet, to take effective measures to protect the back-door of Australia from forcible entry. The encouragement of settlement along the northern coast would, however, afford the surest guarantee against successful attack.

٠h

V

We venture to say that Australia must modify her Monroe doctrine very essentially if she wishes to ensure her future prosperity and safety. Nature herself opposes it. Ordinary justice condemns the monopoly of a vast and fertile territory by a people, scanty in numbers, who will never be able to profitably utilise it, while millions of their fellowsubjects in a neighbouring continent periodically suffer the horrors of famine for want of sufficient land on which to grow food. Colour-prejudice, unfortunately, is strong in Australia at the present time, and the democratic politician, who always advocates what is popular rather than what is wise, does his best to inflame it. Nations, however, outgrow in time the arrogance of youth, and the Australian Commonwealth, after sowing its wild oats, will, we may hope, settle down eventually to the task of wisely and soberly guiding the nation's destinies and of developing its vast inheritance in a spirit of prudent compromise rather than one of narrow selfishness and racial jealousy.

THE TOP SHELF.

'OLD books are best,' a poet sometime said,
And surely rightly;

But, then, he meant the books which still are read
And praised politely.

I sing of books—those other, duller tomes, Neglected, dusty—

Which find on topmost shelves their final homes, Mildewed and musty.

Their day is done. No reader nowadays

Seems aye to need them;

E'en I, who love all olden things to praise,

Could never read them.

Yet, none the less, I love to think that they, Just as their betters,

Were works of love to those who in their day Were men of letters.

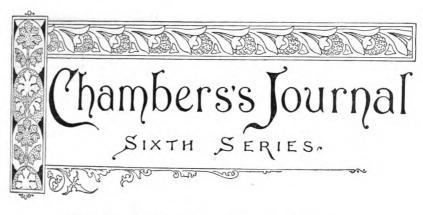

The white-haired parson who in joy would frame Those sermons dreary,

The poet whose poor verses (writ for fame) Served but to weary,

The scholar, liar, jester—one and all—
Who of their dreaming
Fashioned these books, to each was given the call;
For, to my seeming,

The magic of an olden book is this.—
Time cannot fade it.—
That keen, swift joy, the writer's highest bliss:

'My book. I made it.'
F. W. SAUNDERSON.

THE NOVEL T O-D A Y.

By JAMES MILNE, Editor of The Book Monthly.

LL you give me the latest novel?' said a bright young woman as she walked into a London circulating library the other forenoon. 'Which one ?' asked the attendant. 'We have had eight new novels

in this morning.' 'Oh,' quoth she, 'then I'll have the one that came last.'

The story is illustrative of the swiftness of the stream of modern fiction. Often it is written quickly, mostly it is read quickly, and in the great proportion of cases it dies quickly. In fact, the nodern novel has become a thing characteristic of the strenuous, hustling age in which we live. It may, therefore, be claimed for it that it reflects life, however it may stand in regard to literature. But il you ask men who are always reviewing novels, they will tell you that the average quality of them a probably higher than it has ever been. There is plenty of talent about, gifts of undoubted quality; it is originality that is so scarce, genius that is hardly to be found at all. In a word, the story made by but skilled craftsmen is in the ascendant, but we igh for the masterpieces, and they do not come.

Much has happened in the fiction-mart since the three volume novel was snuffed out some fifteen ters ago. It had been created by the circulating library, an institution which, in effect, was invented by Madie, and which is still more or less peculiar b this country. The 'three-decker' was a suitable, profitable form of book for the circulating libraries to long as the number of novels was not excessive. Then, increasing by 'leaps and bounds,' the number become excessive, the libraries were in despair, not knowing what to do with all this stuff. You could into the catacombs, say, of Mudie's, and see loads of three-volume novels which had had their brief ty and become useless for any purpose—'scrapped,' a the American phrase goes. Readers ate up 'three buners'-which, mind you, were published at a Stines and a half, although the libraries got them a guinea or less in a day or so, and cried for True, there were plenty more, but that was not everything. The life of the three-volume novel got shorter and shorter, and ultimately the libraries said, 'We really cannot stand this any longer. We suggest that the solution of what has become a serious problem is the publication of novels in a single volume at six shillings.' The passing of the 'three-decker,' which had been the 'only certain packet to the Islands of the Blest' for many an author, was not exactly so rapid as this, nor was the coming of the single-volume novel, as we know it now, just so expeditious; but practically both

events happened together.

We have seen, too, why they did happen-because there had uprisen a public of novel-readers so great that the creaking machinery of the clumsy threevolume novel could not minister to its wants on what may be termed a profitable basis. This public has been growing ever since, and indeed we now and then hear the alarm that, as a people, we are getting to read nothing but fiction. That alarm is generally based on the figures of some popular library, but if they were carefully analysed they would appear in rather a different light. We are told, quite accurately, that 60, 70, or even 80 per cent. of the books issued through a circulating library-and one takes it rather than a free library -are stories of one kind or another. Even so, we should bear in mind that a story is read much more quickly than a serious book, is exchanged far oftener. It is exchanges that are counted, and so, in figures, the novel acquires a predominance which it really does not have in fact. In the old days, when book-readers were more limited, they were also, it may be, of a higher class, taking them as a whole-few but fit. They read fiction, and a good deal of it, too; but they also read other books, and fiction did not become the red rag of danger which it has seemed to be in later years. We still have a similar old guard of readers, people who love and buy books as well as borrow them; but they are outnumbered by the great army of newer readers who turn to the printed page merely for recreation.

[All Rights Reserved.]

DECEMBER 29, 1906.

It may safely be said that if there were no novels these people would read nothing at all except perhaps the births, the deaths, and marriages, and the society paragraphs in the daily newspapers. You will learn at a London West End library that there are great ladies who call almost every afternoon for a new novel or two, just as they might go forth to choose a new bonnet. The chances are that those ladies turn to the first page of a story and then to the last page, and on that evidence decide whether they shall read it through or not. Has it some problem that will interest them? Perhaps not. Back it goes without being read. Has it a happy ending? Perhaps not. Back, also, it goes next day-for every woman likes a novel to end happily-and thus the lottery of fiction-reading goes on with the constant patron: 'constant reader' one had almost said, but the phrase is singularly inapplicable.

There we get a side-light on the huge consumption of new fiction, for the process is not limited to any single class of society. Men eminent in politics, in lnw, and in other walks of life are often keen novel-readers. A judge, after a hard day's work administering justice, will call at his bookseller's on the way home and ask for a good novel. 'You see,' he will say, 'I have been seeing the seamy side of life all day, and I want something which will brighten me up in the evening after dinner.' It is the same with busy doctors, and with business men who find themselves too tired after the day's work to do anything but read the lightest of literature.

The growth of the modern novel has not been without its causes, and how could it? Nothing arises from nothing. On the one hand we have a prosperous world, working harder and harder every year, and on that account driven to seek in its reading something of a 'rest cure.' It was Mrs Cecil Thurston who first used that expression in explanation of the great vogue of light fiction, and it was happy and just. Then, on the other hand, we have the mass of new readers which the Board schools have been turning out—readers whose literary taste thus far centre in fiction, with a preference for the sensational kind, and in cheap reprints of books which have become classics.

All this merely means that the times have changed, that we live differently from our fathers and grandfathers; that, as a whole, we have less leisure, and, in particular, that learned leisure is not to be found so much about. But of reading of some sort there is far more than ever there was; and, if one can estimate the signs, the demand for books promises to be greater and greater as the years go on. Partly it is this outlook which has caused a controversy during the present winter as to whether new novels might not well be published more cheaply. The three-volume novel, you will be told, had its day and generation, and disappeared never to return; the six-shilling novel, its successor, has had a good run, and has the time not come for something still

cheaper? These things settle themselves by a process of evolution rather than as a result of direct action by the author, the publisher, or the bookseller. Public taste and demand are the influences which ultimately tell, or, to express it in other words, there comes a day of ripeness for change, and with that, or very soon after, the change itself, which then seems both natural and inevitable. Is the time ripe for the issuing of full-blown new novels at, say, half-a-crown? At present you actually pay four shillings and sixpence for a story, if you buy it at all, which probably you don't, because it can always be got at the handy library.

That is a point which has to be steadily borne in mind in any estimate of the future evolution of the novel. Our habit, as a nation, is to borrow fiction and read it, not to buy a novel outright, as the French people do, or as, mostly, the The circulating library is an Americans do. integral part of our book-world, and it could scarcely have become so if it did not suit British tastes. If everybody who borrows a novel suddenly came to the resolution to buy it, then the halfcrown new novel might arrive to-morrow and be a tremendous success. But that will not happen, and there are good reasons in the interest of literature itself why it should not happen. Apart from anything else, the circulating library acts as a sort of sifting-machine for current literature. Suppose you take books out for a year, and then on Christmas morning look over the list of them, how many of those books do you want to buy and keep? Perhaps three; perhaps half-a-dozen. Here you have the cream of the year's new books selected for you, as it were. You can buy them, knowing that you are not wasting your money on volumes which, if you have any real regard for literature, you would not put on your bookshelves.

In France, of course, most books are issued with paper covers, and so the buyer can either throw them away when he has read them, or he can have them bound in cloth—in leather if he wishes to be extravagant - and put into his bookcase. Small experiments in the publication of paper-bound books have been made in this country, but they have never succeeded, and by all appearance they never will succeed. The British reader has only one view of a book which is bound in papernamely, that it is to be read and left in the railway carriage or thrown away. The bookseller will tell you that in a dirty atmosphere like that of London, Manchester, or Glasgow, paper-bound books rapidly become 'bad stock'-that is to say, get soiled and unsaleable. Discuss those matters by all means, but it is to the music of the grand army of novel-readers as they march to the libraries, there to borrow their books without ever a thought of buying them. The truth is-and it may be said gently-that as a nation we are not exactly a book-buying people. Edinburgh is the best book-buying town in the world, having regard to its population; Scotland buys more largely than any other division of the Empire; but neither Einburgh nor Scotland stands for the whole union. One wishes, in a book-sense, that they did, just as one regrets that, in a book-sense, there is so much black country. Football is the deadly enemy of reading in winter—yes, it even hurts the rading of sensational novels; and summer calls people out of doors.

We return to this, that the popular library is the great channel of custom for the popular novelist, and that without it he-or she-could not get the high royalties which he is paid unless, indeed-and ever this is the barrier-he could agrest novel-borrowers into novel-buyers. An enthor's royalty of one shilling and sixpence on a strabilling novel is frequent nowadays, and in a itw instances as much as two shillings has been paid to novel-writers. Broadly speaking, a pubinher will get three shillings and sixpence for sch copy of that novel, and thus he has one shilling and sixpence with which to manufacture ", alvertise it, meet his office expenses, and make i little profit for himself. He can only do so viere the sale of a story goes into many thousands, and those that do so are few and far between. The trange novel sells between one thousand and two copies; a story that reaches a sale of are thousand copies achieves high success; when one runs to ten thousand copies then the word 'bom' may be applied to it.

Carly, it would be a tremendous casting of bread ipm the waters to bring out the average novel at two killings and sixpence right away. It would be all nat ii, by some chance, it managed to catch the Pilic ear; only that chance is very remote. When Doors first appeared it went very slowly. M: Sampson Low, who published the romance, beand absolutely in it, and he determined to give as second chance. Accordingly, he brought it out a ingle-volume form—hitherto it had been in three sines about the time of the marriage of the Augus of Lorne to Princess Louise. The great inish public got it into its head that the romance at smething to do with the Royal marriage, and success of a fine book was made by that mere But such a bit of luck is not to be lighted arren day; and, knowing that, most novelists are titled to say, There is a living wage in the sixthe novel when it has a moderate circulation; 13 miles when it goes to a large circulation. There act be a living wage in a half-crown novel with a small circulation, and to rely upon a huge circulation, as things are at present in the reading world, would be to gamble exceedingly. We had better, therefore, go on with the six-shilling novel, which, after all, is a self-respecting form of literature.' The bookseller adds, with a twinkle in his eye, that he is willing, good man, to let anybody have any six-shilling novel for four shillings and sixpence—surely a large discount; and don't we all like to make a bargain?

We may even choose our particular fancy in novels and not pay any more-choose as a woman chooses from the fashions in clothes. Moreover, there are fashions in fiction. Twenty years ago the romance of history, the mere adventure story, and the domestic tale were the current brands, and readers sought no others. To-day the novel is much more varied, more comprehensive in its subjects, more resolute in its character-painting. We have had the sea-novel, the novel of social life, the novel of modern science, and what you will, including, more recently, the motor-novel. The good soldier is he who can go anywhere and do anything; well, the modern novel can go anywhere and do anything. It need not, like the soldier, be good; but that is a detail.

Two chief impulses there have been in the broadening out of the story as a form of literature—one from within, the other from without. We have had the triumphant rise of the woman-novelist, and we have had the demand of readers for studies of life as it appears to the woman's mind. The two impulses, therefore, are really one, and the result finds us at this, that quite half the stories of the time are written by women, and often theirs is the best work. Is it the story of a soulful heroine—the type of the heroine who is just now the height of fashion? Then the woman's pen, at its best, penetrates deeper, cuts cleaner, does its work more deftly, than the man's, if often less justly. But women are rarely humorists, and perhaps we owe it to their very triumph in fiction-writing that there are so few good, humorous novels. Satire you get, wit perhaps, rarely merry humour such as characterises some of the great novels of English literature.

It is a chance this for whoever would be a novelist—a successful novelist, courted by the literary agents, the publishers, and the public. Let that person sit down and write quickly a really humorous novel, and it will be welcomed as if it were sunshine on a winter morning.

MANOR. ТHЕ LORD O F тнЕ

CHAPTER VI.

NT GERTRUDE started and quivered; there was a faint pink on her faded cheeks. Warrener turned to see the cause of this sudden display of emotion. He saw that

Angela was standing there pale and cold in the moonlight. She said nothing, she asked no question, though clearly she must have heard what was said. She ignored Clifford as if she had been absolutely unaware of his existence.

'You must come in, Aunt Gertrude,' she said.

'The night is getting chilly.'

Miss Castlerayne followed with the meek obedience of a little child who is detected in a fault. In her heart of hearts she was terribly afraid of Angela. Warrener walked behind, with a smile on his lips. So far as he was concerned, he had not the slightest doubt as to the ultimate issue. He could see the sword of Damocles hanging in the air; he was prepared to cut the suspending thread if the weapon did not fall as quickly as he desired. He would root this senseless, selfish pride out once and for all.

He was just as set of purpose the next morning as he came across the Common before breakfast from a long interview with Samuel Craggs. He had found the old reformer in a savage state of mind. Craggs had been talking to Marfell.

'We are being murdered here,' he had said, 'poisoned. It's the drains. I told the squire all about them years ago. But where the money is coming from '-

Warrener explained where the money was coming from. Also, Craggs need be under no fear as to the future of the hospital.

'It is merely money borrowed,' he said. 'I shall get it all back again as soon as you win your action, so there need be no outrage of your sturdy Radicalism. I want you to press your action on as keenly as possible. The squire will fight you, and he will be badly beaten. And he will not be in a position to pay the costs of the fight. Really, I am very much in love with the little scheme of mine. I'm going into Hardborough as soon as I have breakfasted, and I shall hope to meet you there after luncheon. And I hope you have the grace to be very much ashamed of yourself, Craggs.'

'I ain't,' Craggs said stolidly. 'Not a bit of it. On the whole, though I'm what you call Socialist, not to say iconoclast, I like your scheme better than mine, sir. I love the place too well to see a hotel here.'

'To say nothing of the fact that we can do so much better, Craggs. What would my friends in the City say if they could see me losing such a glorious chance of making money? Instead of which, I am wasting my time putting it in the pockets of other people !'

Perhaps it was the glow of a clear conscience that enabled Clifford to eat so good a breakfast. He walked in the rose-garden afterwards, enjoying his cigarette. Aunt Gertrude was not down yet, and May was not to be seen. Presently to Clifford came Angela. She looked very fair and dainty in her white print dress, with plain cuffs and collar. It was a beautiful face, Warrener thought; it would be all the more levely still without the cold expression. It was quite evident that the girl had something serious to say to her companion.

'Been helping to make the beds?' he asked cheerfully. Like most utterly bald remarks, it had its effect. In the presence of the commonplace, even dignity turns its face. 'If ever I am so fortunate as to win a wife, I hope she will not be above helping with the beds. I wonder if you could make a tart, Miss Angela-a raspberry and red-currant tart. I'm told that it is a real art properly to boil a potato.'

The ghost of a smile curved Angela's lips for a moment. Really, she had not expected to find Clifford Warrener vulgar. 'I know nothing of what you say,' she replied.

'I did not come from the house to discuss domestic economy with you. I wanted to allude to a little conversation I overheard last night between Aunt Gertrude and yourself. You seem to have made a friend of Aunt Gertrude.'

Warrener bent down and sniffed at the red heart of a rose. So Angela had heard. All her queenly dignity had come back to her; she was once more a Castlerayne of The Towers sweetly condescending to a glorified tradesman who had forgotten the calls of his order. It became necessary, therefore, to be harsh once more.

'I should say that anybody would,' he said. 'Are you aware that at one time your aunt was engaged to my father? When my father decided to go into trade the match was broken off. My mother is one of the best and dearest of women; my father's affection for her was warm and sincere; but his heart was Aunt Gertrude's. When I think of it I am filled with the most bitter contempt for those who interfered. But, of course, it could not be; it was quite impossible that your blood could be contaminated with trade. Miss Angela, I am going to speak very plainly to you.'

Angela gave a little gasp; she faltered before the blazing fire in Warrener's eyes. Verily, the interview was not working out quite so smoothly as she had planned it. She was going to be cold and disnified, sarcastic, but always as befitted her father's child. She was going to insist upon a proper explanation of Warrener's cryptic words of the night before. She had made up her mind to forgive him if he were duly penitent. And now-

'Really,' she faltered, 'I am quite at a loss to understand why?

'Then I had better hasten to explain. I won't meak about your early life, but about mine. My father decided to go into trade because he was an bonest man. He had an eccentric weakness for paying his debts. He could not understand why my grandfather never paid anybody. The fact that my father was a very unsuccessful business man has nothing to do with the story. Suffice it to say that be brought me up to share that eccentric weakness of his, and that I have never regretted it. When some twelve years of age I went to stay with my gundlather. We were poor enough, and often we lived the life of the keenest anxiety; but it was letter than the life at the other place. My grandisther lived in a very cycle of debt; all his nicest selings were warped. My grandfather counted the cost of nothing so long as he got all he wanted. He was a fine gentleman; he was a man of honour; be was a Warrener, in short; but that did not pretent three of his victims from dying in a workhouse and one of them from committing suicide. I tell 100, no swindling scoundrel in the City was more egraded in my eyes than my grandfather. I hated and loathed it all. I got away from it as soon as I could, and I was only a boy at the time. To think of those poor, patient creatures being robbed so that the good name of the family for hospitality could be kept up! Nothing was paid for. It was no letter than picking pockets. And there was the man who spoke in tones of the deepest regret for his son who had gone into business! But I dare ay rou are wondering why I tell you this. Let as ask you a question: Do you know any houseand where exactly the same kind of thing is going

angela's face flamed crimson; the cruel tell-tale Lie famed over her features; the tiny ears were its with an agony of shame. Warrener had struck one, and he had struck hard.

You are going too far,' the girl said. Her voice kok; her eyes were full of tears. 'It is not fair t sy this when you are under the shadow of our bee. And it is not true.'

hutrue, Warrener said slowly. 'Oh, I know at this talk of mine is inconsistent—that it aceds the bounds of what society calls good la ordinary circumstances I should say where to you and go; but I can't say good-bye Angela, because I love you, and because tag day I hope to call you my wife. There is denthing that is good and sweet under that namer of yours; but the time has to come than you shall realise that to be Miss Castlerayne "The Towers is not everything."

appose you mean to pay me a compliment, agela cried. 'If that is your idea '-

it it I am paying you the highest com-Final a man can pay to a woman. The remark a trite, but it is true, all the same. And I tell an glad that you are going to have your lesson. Before long The Towers will cease to belong to you.'

'Really, is this part of the lesson that you have arranged for me?

'The lesson is no doing of mine. Later on you will thank Craggs for that. It sounds like a wild and impossible situation from some play, Miss Castlerayne being ousted from her high estate by Craggs the Radical shoemaker! Craggs will fight your father to the end, and he will win his action. He is certain to succeed in proving the rights of the hospital to the Common. I have been all through his claim, and there is not a flaw in it. On the other hand, your father will fight as bitterly and as obstinately. He will lose, and the action will cost every penny of two thousand pounds. It won't be for Craggs to forgo these expenses, because they will form part of the costs of his solicitors; and solicitors keep their offices open for the specific purpose of making costs. They will bring a further action against your father for the raising of this money. They will make a bankrupt of him if he does not pay. Then everything here will be sold and the house will have to be let. May I ask, Miss Angela, what is going to become of you then?'

Angela looked at the speaker with dull eyes. She was trying to comprehend what all those hard, cold words meant. The full force of the picture was coming to her slowly. She tried to smile, but the smile faded from her lips. All her dignity was gone now; she was merely a very pretty girl mutely asking for a strong man's protection.

'And this is your lesson?' she faltered. 'This is what you hope will happen?

'It is your own lesson,' Warrener retorted, 'brought about by yourself. And you will be the better for it. Still, there is an alternative.'

'I am glad to hear that. Will you be so good as to tell me what it is?'

'Not at present-that would spoil the actual beauty of the story. But one thing you may be sure of: this lovely spot will not be defiled by a hotel. There is a far better way out of the difficulty than that. I would suggest it to your father to-day, but I feel quite sure he would not listen to me. He also will have to learn his lesson at the hands of the immovable Craggs. After the lesson is learnt, I shall come in again as a kind of fairy godfather and put things right. I shall put things right mainly by the use of the money that I have made in my despised trade. Where my model village stands to-day was once desolation and misery and demons in drink. To-day the place blooms like a rose. In this lovely spot is anxiety and doubt and despair; when I have done with it all those demons will be gone. I can't tell you more, Angela, because if I did so I should spoil the romance of the story. There is one thing that I ask: that you will give me credit for a sincere desire to'-

Angela looked up swiftly. She had forgotten that she had had all the worst of the argument. She saw the high resolution that shone in Clifford's eyes; she felt like one who is in the presence of a prophet. Her heart was curiously warm and light; she felt strangely drawn towards this masterful man.

'I do,' she cried impetuously. 'Perhaps I am utterly wrong. Perhaps we have lived in far too narrow a circle here. Mr Warrener, let us shake hands. Though we are to be foes we may respect each other. And if you can convert me'-

(To be continued.)

77

THE PHYSICAL DEVELOPMENT OF WOMEN.

By W. B. TEGETMEIER.

HE disadvantages of old age are very great, and are hardly compensated by the fact that persons greatly advanced in years, possessing their memory and faculties, have some advantages that cannot be possessed

by younger persons. It is exceedingly interesting to them to recall the conditions of life in the earlier part of last century, and compare them with the extraordinary development that has taken place in its latter half and the beginning of the twentieth century. To those who recollect the time when distant travel was performed on coaches, and that never a hard winter occurred but the bodies of some outside passengers were conveyed to their destination, life being extinct; when railways were not only unknown but undreamt of, and a man who had journeyed between the capitals of the three kingdoms was regarded as an experienced traveller, the alterations in the physical attributes of women are very remarkable. They are unquestionably much taller, more vigorous, more healthy, and in consequence more active than they were half a century ago. The number of tall women seen walking in the streets of London or any large town is, to those who recollect the first half of last century, exceedingly remarkable.

Now, it may be asked, to what circumstances is this alteration in the physical stature of women to be attributed, because its existence is undeniable? Frederick the Great, did he now exist as a tyrannical monarch, would have no difficulty whatever in finding wives of suitable stature and physical abilities for his regiment of Guards that he designed to be succeeded by children of a larger growth. There is but one answer: it is to the alterations of the conditions of life. Formerly women followed sedentary habits; they were in the great majority of cases simply domestic drudges. Now the practice of healthy outdoor exercises has not only largely increased amongst men, but has extended to the other sex. Take, for example, the practice of bicycling, not merely as an amusement, but as an economical, rapid, and advantageous means of locomotion. When bicycles were first established in the seventies, men only rode on them, and I can recall how a lady of my acquaintance, who was one of the first to utilise these machines on the introduction of the present type, was accosted, not offensively, but in the most demonstrative manner,

by a gentleman, who told her as she rode by my side, 'Madam, you are a disgrace to your sex.' Such narrow-minded opinions have passed away, and the man who insulted a woman in such language now would rather be regarded as one who

was a disgrace to his own sex.

The physical advantage of bicycling to women is enormous, the exercise being regarded as a healthy occupation; they ride infinitely better than the ordinary run of men. It is rare to see a woman on a bicycle leaning forward in a crouching attitude, with hunched back, compressed chest, lessened lungspace, and constricted abdominal viscera, which is the usual attitude of those silly riders who think that, because racing men assume it in consequence of the reduced atmospheric resistance it offers in the extremity of a race, it is the right attitude to affect in ordinary riding. Countless thousands of women ride with due regard to the inflation of their lungs and the proper exercise of their muscles, and their health, stature, and physical development are improved thereby. Then, again, it is the practice now for women to indulge to a great extent in outdoor games, which have gradually been improved in character so as to afford due physical exercise. Croquet, which was formerly the only game generally indulged in by women, is one of a more inactive character, and calls for no great amount of physical exertion, although it has the advantage of being played in the open air. This has given place to lawn-tennis, a much finer exercise, which in its turn has been succeeded or accompanied by hockey, golf, and cricket; and even football has been played by some advanced women; but it is obvious that the latter is not a game which is adapted either to female dress or attributes. Formerly even those women most fortunate in their position in life and in their opportunities of taking exercise were confined to riding, or possibly, if favourably situated, to rowing or paddling on the river, and the result was that the physical stature of women had few chances of being developed. Now this is changed to a very great extent, and the result is that we see finer, taller women, more upright, and much superior in muscular and bodily development. There is no reason why the muscles of a woman should not be developed as well as those of a man; they are capable of becoming so to an extraordinary degree if properly exercised. If any person doubts this capability, let him examine the hand of a female professional pianist, who plays, possibly, several hours a day, when the muscles of the hand and forearm will be found developed to a degree of firmness greatly superior to those of the majority of men.

Now comes the question, is this increased development in women advantageous or otherwise? Does it in any way interfere with their mental character, or is it purchased at any loss of any other

desirable power? The answer to this is decidedly in the negative. Women thus exercised, regarded from a mere physical point of view, are stronger and healthier, and would be the mothers of stronger and more healthy children, than they otherwise would be; and this cultivation of the stature, muscular power, and healthy action of the respiratory and digestive organs of women cannot but be regarded with satisfaction.

HISTORIANS I HAVE KNOWN.

By T. H. S. ESCOTT.

ROM Brobdingnag to Lilliput is a phrase that describes one aspect of the relations between the nineteenth and twentieth centuries. In the worlds of thought and action, of art,

letters, science, and politics, the great laters had disappeared before the close of the Victorian age. The opening years of the Edwardian en brought no successors to fill the empty places. When, about the period at which household suffrage learne the law of the land, the present writer's london life began, the literary system was dominated by perhaps the two most representative writers the ever flourished simultaneously in England. These were Lord Stanhope, the biographer of Pitt, ad Edward Bulwer, first Lord Lytton. Many as were the points of difference between the two en their intellectual operations often proceeded on much the same lines. They shared the distinction of being the patrons as well as princes of their prolesson. The industrial methods of both possessed areal resemblances: each died within a short time d the other, on the same southern shores of Engand Bulwer Lytton at Torquay in 1873, Stanhope two years afterwards at Bournemouth; both also remained students as well as authors to the last, equing fresh knowledge quite as much from nd love of learning as with a view to its relegization in print; both also had been, during man part of their lives, not merely members d Parliament but practical politicians and active theren. In the midst of these employments act found time practically to display his interest a the craft of literature, as well as in whatever aghi concern the welfare and dignity of its proworkers. Both, too, though in different degrees and manners, belonged to the company of asoning, some of whose personal traits are now to

To most persons these men are known only by its vitings which have become the world's posterious. What, then, were the processes involved in the delivery to an earlier generation of their respective assess by the littérateurs who took all thought draiter who brought the eighteenth century into the form assumed by the finished re-

sult in each case was very different. The labour expended on it had been, in both instances, ordered after the same fashion. Bulwer Lytton's professedly historical writings are few. His pieces on England and the English, or on Athens: its Riss and Fall, are rather literary studies than formal attempts to present familiar facts in a new light or to enlarge by original research the popular knowledge of a remote period and its people. The historically useful portion of Bulwer Lytton's work is to be found in those of his novels whose periods and personages he had 'read up' in much the same way that an undergraduate prepares his books for the schools.

The present writer very clearly remembers a conversational vindication by Lord Lytton of the intellectual dignity of the novelist's and storywriter's occupation. At some length and with much enthusiasm he dwelt upon the clearness and tenacity of brain necessary not only for the invention of plot and underplot, but for keeping the one general motive of the whole steadily in view, as well as in developing the characters, each in his or her natural place, to work the machinery of the narrative. The novels which show Bulwer Lytton's historical aptitudes at their best are still less known than his later romances of domestic life or than his earlier fictions, whose atmosphere is that of fashionable or fast society. The novelist himself always considered Zanoni, with its sketches of the French Revolution, to be his best work.

It was, I believe, at a dinner of the Literary Fund, to which both men rendered signal service, that Stanhope, referring to the accurate knowledge of men and events, early medieval or modern, shown in Bulwer's novels-from Harold as a story of pre-Norman England, or Rienzi as a picture of fourteenth-century Europe, to Devereux as a true account of the Queen Anne period, of which Stanhope was more specially cognisant—claimed for the author of these romances the title of historian. 'When,' Bulwer used to say, 'I meditate a novel, a poem, or a play, whose chief scenes are in a particular country, and whose characters belong to certain periods, I begin, so far as is practicable, by steeping myself in the local colour of the lands wherein the creatures of my imagination live and move. If this can be done

by actual residence in the country itself I make my habitation there. There, too, I generally discover persons I can press into my service by making them unconsciously sit for their portraits. In other cases, I pass days, weeks, months, sometimes even years, among the most authentic documents I can lay hands upon. But in either case I seldom attempt to transfer to paper my matured and circumstantial impressions till some time after the assimilation of the material has been completed. I then write the thing piecemeal, sometimes not more than a hundred lines at a sitting, putting down the pen, or more often the scribbling pencil, directly I feel the freshness of thought passing off. Later on I review the results of each separate writing and redact them into paragraphs, chapters, scenes, or acts, as the case may be.' Lord Stanhope's mode of composition was not dissimilar. He wrote down, generally in pencil, and in a sort of shorthand of his own invention, as much as he had mentally prepared, with the aid perhaps of many days' consultation of authorities. Later in the same day, but never later than the next, he made a fair and full copy of this. If he left it for more than twelve hours he was apt to find a difficulty in deciphering his notes.

Neither Bulwer nor Stanhope ostensibly led the life of a man of letters. The historian, after an hour or two of composition, found a pleasant change in going to her sitting-room and chatting with his wife. For some years during certain periods of the day, his horse could be brought round at a moment's notice, ready saddled, from the stable. Going up Grosvenor Place into the Park, he rode till he felt thoroughly reinvigorated, and then returned to his desk. Or he walked to the Athenæum Club; after chatting with acquaintances in the morningroom, or as often overhauling any new books in the library, he went back to finish his day's labour. Bulwer occasionally found the same sort of refreshment, but less frequently when in town than in the country. The noise and bustle of the London streets, or the demand on his energies made by club-talk, broke, he said, the continuity of his thoughts. He returned to his library only to find that he had to begin again from the

Till his health first showed signs of failing, Bulwer made a point of going to some London theatre once a week. Stanhope was only a playgoer because it seemed a duty to encourage the stage as an institution; but the only time I saw these two distinguished persons together was at a performance in the old Adelphi of Tom Taylor's Green Bushes. They were then seated in adjoining stalls. Of the two, perhaps from the greater novelty to him of the piece, Stanhope watched the stage with the closer attention. Once more they must have been at a theatre again in each other's company. One December evening in the later sixties I happened to be at the St James's when Henry Irving made one of his earliest bows to a London audience

in a 'character' piece that could not have fitted his special genius better had it been written for him. This was Hunted Down. The chief parts were taken by the then Miss Herbert and by Henry Irving respectively. Going into the corridor, I passed the novelist and historian issuing from their box. Lord Stanhope was rubbing his hands in glee. 'Capital! capital!' was his single comment; he seemed to be going to another part where George Eliot and George Henry Lewes had witnessed the representation. The illustrious trio, I afterwards heard, agreed that Irving's rise marked a new theatrical epoch. Both Bulwer Lytton and Stanhope were in general society silent men. Bulwer, when he consorted with London littérateurs, seemed to prefer those who shared his theatrical interests. Stanhope chose the historians; his particular intimate was always Macaulay.

That remarkable man had passed away before my time; but during the years I now recall, when driving by Clapham Common, I recollect seeing Broomfield, Zachary Macaulay's house, or, to speak strictly, the house belonging to William Wilberforce, where the historian's father regularly forgathered with other leaders of the Clapham Sect : Charles Grant, Granville Sharp, Henry Thornton. There was pointed out to me in the garden the particular tree under which were appended the signatures to the Anti-Slavery Petition. As a very small child, I had heard something about all this from no other than Lord Lyndhurst. He, in his youth, had seen much of the Claphamites. A few years before his death he occasionally visited the house of a relative where I was being brought up. From him also I heard all that I know of Lord Macaulay's conversation. He repeated, I remember, a saying of Brougham's that Melbourne objected to Macaulay in the Cabinet because he did not like 'ten parrots and the chime of bells.'

'A conversational cannonade with seldom a pause for fresh ammunition.' Such was the estimate of Macaulay's talk given me by another historian as famous as himself, with whom, during several years, circumstances placed me on terms of intimacy. This was J. A. Froude. Supposing this account to be accurate, there could have been no greater social or personal contrast than that between the apologist of the Tudors and the panegyrist in many volumes of the Whigs. Froude could be, when he was in the humour, a delightful companion. To those who had cultivated the taste for appreciating him, he was always a most interesting one. Socially, he suggested the flavour of green figs, olive, or caviare. These are all luxuries, but not equally acceptable to every palate. In like manner, Froude, in his social moments, suffused his conversation with a sort of bitter-sweet taste which intellectual listeners might admire, but which did not give the same pleasure to all. The truth is that, notwithstanding the gulf which separated his early life, his sacred calling, and his associations from the employments, the ruling ideas, and the sympathies of his after-years, in manner at least, as well as to

some extent in general tone, Froude never ceased to be a High Church clergyman and an Oxford don. Between the historian and his brother Hurrell Froude, the colleague of Pusey and Newman in the 'Oxford Movement' of the thirties, there existed the same spiritual contrast as that which distingaished the future Cardinal John Henry Newman from his consummately clever brother Francis. Just also as J. H. Newman, when cardinal, never acquired the social bearing of a Roman priest, but aways remained an English clergyman with a grougly perceptible flavour of the Oriel commonnom; so James Anthony Froude, throughout all the years which followed the divestiture of his English orders, might have been mistaken by a stanger for a ritualistic vicar or a sacramentallyminded curate meditating the offensive against the Juicial Committee of the Privy Council. As to the accuracy of Froude's declarations on some of the controversial points touched by him in his asor, no opinion need be expressed here. The elisacrificing labour taken by him to inform him-Mi, from the original sources, on all such topics is matter of personal knowledge to the present TRUE. In view of his chapters about the sixteenth and seventeenth century relations of Spain and England, I have seen in his library in Onslow Gariens the piles of manuscript books in which be condensed the notes of his reading for weeks and months in the archives of the Escorial. When I mentioned this to Lord Acton, then living almost within a stone's throw of Froude, in what is to-day Mr Chamberlain's house, 40 Prince's Gardens, I recollect Acton's comment, or that of some other pandit in his presence, to have been, 'Even so Manlay, when on the Indian Council, discovered a the Government book-room fourteen volumes, Great folios, of Chrysostom's works; he read zarly all of them, and knew no more of the select at the end than he had done at the

During my undergraduate days at Oxford, no Enler of the examining body excited more dread ul aversion than E. A. Freeman of Trinity. Cardidates for Honours in the History Schools enely prayed that they might be spared enocatering this most Rhadamanthine of inquisiin a rice roce. For Froude, Freeman of course the contempt born of an absolute distraining of intellectual temperament. Neither the Saturday Review dinners nor in the comlais in which I have met Freeman at Wells did k often show himself a genial companion. His tag for snubbing amounted to a craze; his catacy to contradiction on every possible opporany altogether exceeded that even of 'Bob' Lowe, lor Sherbrooke, himself. Freeman was more agreethe to encounter in the open air than at a dinnerin the Mendip district, whenever I heard those shoots pelting along some piece of turf by tradside, and a voice singing the refrain of the old Cavalier song, I knew that if I looked

round I should see the historian pounding along on a sturdy nag which, according to tradition, in a burst of generosity he once offered to Carlyle as a gift. As to that philosopher, whom Ecclefechan presented to Chelsea, and who for a generation preached the gospel of silence in some fifty volumes at Cheyne Walk, I owed my very slight acquaintance with him to my old Oxford tutor, John Nichol of Balliol, also Professor of Belles Lettres at Glasgow, or to my earliest magazine editor in London, David Masson of Macmillan's. In those days I was very young and perhaps rather green. Some opening remark of his had encouraged me to talk to the Sage. 'I dare say,' he said, 'people have told you that I am a regular bear of a man. That is only when I do not get exactly what I like, or am out of sorts. But when there is no cold on the liver of me, and everything goes exactly as I would have the people upstairs order it, I am little less than an angel.' After this, my host showing, as I thought, a disposition to hear about me, I mentioned that the Saturday Review, then edited by another Scotchman, the Aberdonian John Douglas Cook, had just published my first newspaper 'Eh, but, young man,' the philosopher article. rejoined, 'let me tell you you are in a fair way of treading the broad path that leads to intellectual perdition.'

'I know something; Stubbs knows everything.' The remark was made of the former Bishop of Oxford by the only other man who ever lived and could possibly have said the words. This speaker was of course Freeman. The two did not pretend to deny that they constituted a very select mutual admiration society. They were both hit off by another Oxford historian in a couplet that will bear quotation:

See, from alternate tubs, Stubbs butters Freeman, Freeman butters Stubbs.

These lines were written by another Oxford historian with whom I read logic as an undergraduate, and whom I afterwards succeeded in the Logic Chair at King's College, London. James Edwin Thorold Rogers owes his place to a monumental work on agriculture and prices in England. Together with the late T. B. Potter of Rochdale, he may claim to have been a founder of the Cobden Club. In a period before Oxford had quite ceased to be cloister, and when married Fellows were the very rare exception, J. E. T. Rogers had the appearance, the conversational tastes, and the social habits of a country gentleman who looked after his own estate and did all his own business himself, rather than of an academic. an intimate friend of President Lincoln, with good stories about whom he diversified his lectures on Aldrich and Aristotle. For this veritable Colossus of the nineteenth century Church of England was a remarkable man, with a personality of his own more distinctly defined than had been possessed by any of his predecessors in the Oxford diocese since Samuel Wilberforce, before the latter's

translation to Winchester. A tall, powerfully made, massive, yet active man, he suggested in his presence at once the power and the agility of the mind within. Intellectually, he was keen and hard as steel; morally, he was tender-hearted, as full of kindliness as of learning, and ever ready to enable others to profit by his knowledge. The present writer, occupied at the time on a socio-personal history of the House of Commons, on the strength of a then slight acquaintance asked Dr Stubbs to read in manuscript certain passages connected with constitutional questions. The bishop was preparing his charge at the time, but as time pressed with me he insisted on my sending the sheets at once; he returned them, with several suggestions showing the thoroughness of his revision, within a few posts.

When he died he was confirming for himself on the episcopal bench much the same place that Bishop Wilberforce had once occupied. But where the earlier prelate plied the rapier, his successor was apt to use the bludgeon. A model guest in the vicarages of his clergy during his visitation tours, he yet habitually said to his clerical flock the most maladroit things in the most inconsiderate manner. Wherever he had given offence, he showed himself promptly ready with the amende. At a public dinner one of his rural deans proposed the prelate's health in a somewhat lengthy speech. The bishop, sitting opposite, dangled his watch ostentatiously before the speaker, who presently collapsed. Before the last postal delivery the next day the prolix parson received two letters of contrite regret from his bishop. Here was, at the Oxonian episcopal palace, the exact antithesis of the contemporary Jowett of the neighbouring Balliol, with his 'never retract, never apologise, never explain, and let them howl.' 'No one man has so vividly impressed a mark so enduring upon a whole course of reading for the History Schools.' Such was Froude's tribute to the bishop's educational work, uttered to me just as Froude himself was preparing to fill the chair of Modern History to which Lord Salisbury had appointed him. To the tedious, the impertinent, the pretentious, and the indifferent Stubbs could |

be peremptory enough. To those who, even without any right to approach him, like the present writer, wished to profit for some useful purpose by his huge brain and even huger knowledge, he showed himself the kindest of friends as well as the most serviceable of sages.

In social manner W. E. H. Lecky was not unlike J. A. Froude. Both conveyed an idea of shrinking sensibility; flavoured, however, in the case of Froude with a soft sarcasm and a mocking irony, which were replaced in Lecky by a subdued Hibernian gentleness which made him a universally likeable man. Both these historians were never seen to more advantage than when they were the guests of a host who did much for the historical education of the generation which was then rising and which is to-day in its maturity. This was the Dr Smith of universal handbook and dictionary fame. I first knew him as editor of the Quarterly Review. Whether in London club and drawing-room or at his own dinner-table, Sir William Smith, as towards the close of his life he became, ever seemed to me among the kindest, most considerate, agreeable, and instructive of men. Smith became editor of the Quarterly in 1867. The appointment was attacked by a section of literary Tories, then very articulate in the press, on the ground that the new conductor of the historic organ of Church and State was a man whose politics were those of the Trades Union, whose religion was that of Little Bethel, and whose education was that of the Mechanics' Institute. The clever and bitter phrasemaker who coined this sentence some years afterwards wanted a word spoken for him with the Quarterly publisher and proprietor, John Murray of Albemarle Street. The needed service could only be-done by Dr Smith. To him, by a common friend, the application was made. Smith, without a moment's hesitation, ignoring the ancient insult, did the required good turn. At home, in the Harley Street district, Smith invested his dinnertable with a diversity of social and cosmopolitan attractions that recalled the hospitalities of Lord Stanhope when he was yet Lord Mahon, or of Lord Houghton while still known and loved by all as Dicky Milnes.

THE MONTH: SCIENCE AND ARTS.

A FORECAST OF WIRELESS TELEGRAPHY.

CORRESPONDENT calls our attention to the following forecast of wireless telegraphy which appeared in Chamber's Journal, vol. xi., for 1849: 'Those who propose to cross the Atlantic with wires say that it can

only be done by the route of the Orkneys, Faroe Islands, and Iceland, to New Brunswick—equivalent to pronouncing the scheme to be impracticable or indefinitely deferred. But more sanguine or more

skilful experimentalists affirm it to be possible to establish a telegraphic communication through the sea without wires; earth and water, it appears, are quite sufficient for the purpose. The fact that such a communication has already been effected across the Thames is quite enough to cause the parties now in motion to persevere. The modus operandi, generally stated, would be this: A galvanic battery is placed at Dover, from one end of which a wire passes to a sheet of zinc or copper buried in the sea beyond low-water mark; from the other end the wire is led into a coil, from which it is continued

to a greater distance along the shore than to the opposite coast, and there terminates in a metallic plate also under water. A similar arrangement would be made at Calais; and the conclusion, as far as yet worked out, is that the resistance being less letween shore and shore than between the extremities of the wires on the respective coasts, the electric corrent would find its way across in sufficient force to deflect a needle. The idea is most ingenious, and if carried out as anticipated will obviate the difficulty presented by liability of submerged wires to fracture.' Of course, the wireless telegraphy with which we are to-day familiar is quite a different thing from that forecasted above. Wireless telegnphy, as we now understand it, is based upon the discoveries of Hertz. A discharge of high-tension electricity causes a wave of radiant electricity to fly est into space, and this radiant force is capable of affecting suitably designed apparatus at a distance. Seither earth nor water has anything to do with it for the electricity is not conducted, but is proated through space precisely in the manner of ght. The earlier experiments mentioned above depended for their results upon the conductive properties of water, and this method presented the mat disadvantage that a length of wire greater can the distance to be traversed had to be laid on either shore. The advantage hoped for the Fishern was that it obviated the then apparently mammountable difficulties of laying a continuous able across the bottom of the sea. But the scheme age to maught because these difficulties were suravented, and the direct cable seemed to be the most premising method of reaching a foreign shore.

MIALS WELTED IN THE SAN FRANCISCO FIRE.

Mer the great fire in San Francisco, hundreds of the of lead and zinc and other metals were found hard into a solid mass, four or five feet thick, arraing the entire foundation of the ruins of an dishot-tower. This represents a large money-value; troring to its enormous size and weight it is quite ujosable to make use of the metal by any ordiun means. It has been decided, therefore, to cut he metal up into blocks weighing about one ton each, cothis work is now being accomplished by means a electric arc. All the men who are engaged in change or melting the channels through the mass thetal have their faces covered with canvas to rect them from the blinding glare of light. It believed that the work will occupy the whole of ruler, for it is estimated that over two huncoi tons of lead, zinc, and tin still remain to be

ANOTHER CALCULATING-MACHINE.

in exceedingly simple and effective instrument adding columns of pounds, shillings, and pence untily and expeditiously has been brought to The instrument is called 'The British facilition; and, unlike most calculating-machines, Laccedingly small and compact, for it is in the

form of a disc the thickness of an ordinary watch, and measuring not more than five and a half inches in diameter. In the face of this disc are three concentric slots divided and figured; the outer slot being for pence and halfpence, the middle one for shillings, and the inner one for pounds. Behind the slots are what appear to be three concentric cogwheels, and the notches in these wheels correspond with the figures engraved upon the brass plate over them. The instrument is operated by inserting an ivory style, very like a cribbage-marker in appearance, in the notch behind any required figure, and moving the wheel in the indicated direction until further progress is stopped by the style reaching the end of its groove. The style is then withdrawn and reinserted beneath the next figure to be added, and the same operation repeated. The result appears in a little window at one side of the machine. When pence are added the machine repeats after elevenpence halfpenny, and the completed shilling is automatically carried forward by the next wheel and shown in the window corresponding to shillings. In the same way every completed pound is indicated in the next window, and every completed fifty pounds recorded in the next. It is stated that after a little practice a speed of one item a second-pounds, shillings, and pence—is easily attained. Certainly, the instrument is exceedingly easy to operate, and without any previous practice whatever results are attained more quickly and more accurately than by ordinary mental process, unless the operator be one specially trained to figures. And it is easy to see that with a little practice even those who are used to rapid addition can work more rapidly still with this machine. This remarkably ingenious little instrument is so simple in construction that it is hardly likely to get out of order, and as it is low in price its utility should appeal to all who have to do with the addition of money-columns. Even in the household, that bugbear to all good housewives, the housekeepingaccount, may lose all its terrors; and in this connection the little instrument commends itself to those who are searching for an acceptable Christmas present. The calculator, which is stated to be of British manufacture throughout, is being placed upon the market by a syndicate formed for the purpose, having offices at 9 Coleman Street, E.C.

SYNTHETIC CLAY.

A Norwegian sculptor, Christen Daz Magelssen, has invented a synthetic clay for modelling purposes which is claimed to be vastly superior to the natural clay commonly used. According to an interesting account in the Scientific American, Mr Magelssen has for a very long period been studying the clay models known as Tanagra figurines. These have always been a puzzle to sculptors, who have vainly endeavoured to produce similar results in modellers' clay. One curious feature was noted in all these figures, and that was a large orifice generally supposed to be provided for the purpose of supporting the figure on a nail or hook, although it has been sometimes found that the orifice is very unsuitably placed for this purpose. Mr Magelssen, after prolonged study, came to the conclusion that these ancient statues were moulded in soft clay upon a combustible core, which was afterwards removed by burning out; but for a long time he was unable to reproduce the same thing himself. Ordinary clay invariably cracks when built over a core of iron or wood and subsequently fired, and it was found that this cracking was due to impurities such as organic matter always present in natural clay. The Norwegian sculptor then conceived the idea of making a perfect and pure clay by synthesis. To do this he chooses any natural rock, such as granite or gneiss, which is rich in silicates and alumina, and reduces it by crushing to a fine powder. This powder is then mixed with iron sulphate and sulphuric acid, and thus produces a soft, plastic material similar in character to moulders' clay, but without its imperfections. It is believed that, besides its great use to sculptors, this new synthetic clay will be of great importance industrially, for from it may be shaped coils, thin pipes, and thin and light vessels of almost any size or shape.

WIRELESS TELEGRAPHY IN CENTRAL AFRICA.

Wireless telegraphy is to play an important part in the linking up of the continent of Africa. In the Cape to Cairo telegraphic system, started by Cecil Rhodes in 1892, the original scheme was to join these extremities of the continent by means of an overhead wire, and the scheme would probably have been carried out but for the advantage offered by the new system in one portion of the route. The work has proceeded northwards as far as Ujiji, on Lake Tanganyika, and from this point communication with the southern extremity of the northern wire at Port Victoria on the Victoria Nyanza will probably be completed by the wireless system. The country in this region is almost entirely unknown, but it is exceedingly broken and rugged, and would present enormous difficulties to the establishment and maintenance of an overhead wire. The distance in a direct line is about four hundred and fifty miles, and the spanning of this space by wireless telegraphy should be comparatively easy and very much cheaper than by the original scheme.

A MOTOR DRIVEN BY LIGHTNING.

So many people have became familiar with the word 'motor' as an abbreviated term for automatically propelled vehicles that the title of this paragraph may excite fantastic visions of auto-cars driven along our roads by the power which now runs to waste in thunderstorms. That it may come to this is possible, though very far from probable. Still, an actual motor has been constructed and caused to rotate by electricity derived

from the clouds, and it is suggested in an interesting article in the Scientific American that the principle may be utilised to give power in sufficient quantity to be of practical use. Without actually subscribing to this, we may note with interest the ingenious construction of the toy-for that is all it is at present, at all events. Its working depends upon the mutual repulsion and attraction of bodies having a similar or dissimilar charge of static electricity. Every one is familiar with the slight attractive force which causes a small piece of paper to adhere to a stick of sealing-wax which has been vigorously rubbed, and with the repulsive force which makes the hairs on a cat's back fly apart under similar cou-Imagine a very delicately poised disc of some light and non-conductive material having ditions. segments of tinfoil pasted upon it. Opposite this disc are stationary pole-pieces connected with a The charge in source of high-tension electricity. these poles will induce an opposite charge in the insulated segments, which will consequently be attracted towards them and cause the wheel to rotate. If each segment as it comes opposite the pole piece makes momentary contact with it, the opposite charge will be exchanged for a like charge, attraction will give place to repulsion, and the disc will continue to revolve in the same direction. Such a motor has been actually constructed in America and connected with the aerials of a wireless telegraphy system, with the result that during a thunderstorm the motor was found to revolve rapidly under the influence of the induced electricity from distant lightning-flashes. Whether such a motor could ever be made of sufficient size to be of practical utility is decidedly questionable, but the application of the principle is interesting.

AN AFRICAN NATIVE IRONFOUNDRY.

An interesting article in the World's Work gives particulars and excellent photographs of a hitherto unsuspected native ironwork situated in the hinterland of Lagos, on the West Coast of Africa. Here, in a little village of about one hundred and twenty inhabitants, the iron ore is extracted from the earth and smelted after the manner of the ancient Britons in the tin-mines of Cornwall and Devon. The soil containing the iron ore is hewn out by a rough pick made by the natives from their own iron, and roasted over a fire all night. The following morning it is ready for the next process, which consists in pounding it to a fine powder in a wooden mortar. This is the work of the women and children. It then passes through a succession of sieves operated by women, and thoroughly washed to separate the iron from the other substances. The smelting-houses, of which there are eleven in the village, are big sheds with a furnace in the centre of each. The furnaces are built of clay wound round with creeper vines to prevent cracking under the intense heat of the fire, and have clay tubes at intervals for the admission of air to form a powerful draught for the fire.

Charcoal is the fuel employed, and when the fire is well established it is cleaned by the addition of a quantity of slag or flux left over from the previous operation. The original source of the flux is shrouded in mystery; but as it increases in quantity at every operation there is always sufficient of this absolutely indispensable material left over to make a fresh start. Each smelting occupies about thirty-six hours; and considering that the snelters have no instruments whatever at their disposal (they cannot even weigh the charge of ore), it is marvellous that they are able to obtain such remarkable results. It is said that the iron produced in this exceedingly primitive manner is far superior in quality to that which can be obtained from civilised nations. At all events, this appears to be the opinion of the natives who use the material, for these savage blacksmiths cannot be induced to use any other iron if they can obtain some of local production.

WIRELESS TELEPHONY.

It is perhaps a natural consequence of the great amount of attention which has been attracted to telegraphy without wires that the dreams of inrentors should turn towards telephones similarly spented. So far, the results have given rise to to very significant hopes of success; but now, according to reports in the French papers, M. Maiche as made a remarkable discovery in this direction. Particulars of the invention are not to hand, but it s sated that conversations can be carried on with as between two small experimental stations one handred feet apart. Each station consists, it is said, of a telephone battery, a special form of inductionoil, and a frame-like contrivance consisting of a number of insulated wires. It is believed that the distance between the posts can be increased adefinitely by augmenting the power employed in is operation of the instrument. Presumably, howeret, the wireless telephone will be subject to the ane well-marked disadvantage that besets the tegraphic systems dependent upon the radiant of electricity for their operation. The station, it is to a sapposed, will radiate therefrom in all direcas about equally, and will be equally heard at the receiving stations within the sphere of influence. la this case there can be no sort of privacy about is conversations; but that is not the worst, for spoing half-a-dozen transmitting stations to be twing simultaneously, the corresponding halfin receiving stations will each receive six tenger at once, and the resultant confusion of bages would put to shame even the worst inaction noises on the telephone systems with which te are already familiar. If, however, wireless telethey comes to be accomplished it will no doubt bi a sphere of usefulness quite apart from the The fixens at present in use, just as wireless kigraphy has done. It is said, for instance, that he has system will be applicable to submarine vessels, and if for that reason alone its development will be awaited with anxious interest.

TWO LIFE-SAVING DEVICES.

Simultaneously two inventors, Wilhelm Lampé of Germany and John Holm of New York, have announced a portable and extensible tower for saving life from burning buildings and for facilitating the operations of firemen in extinguishing or limiting the conflagration. Both of these inventions are based upon the principle of the lazytongs, that lattice-like arrangement familiar to many in some toys of the Jack-in-the-box order. Although both patents are identical in principle, Holm's is of a lighter and more portable but less complete character. The Lampé tower is, on the other hand, very completely equipped for all emergencies likely to be encountered. In its folded form it is about the height of an ordinary omnibus, and it may be drawn by horses in the ordinary way or fitted with motors for automatic propulsion. At the back of the car is a system of hand-operated cranks by which the tower can be gradually extended to the height of the building to be operated upon. When erected, four light telescopic bracerods are used to steady it, and it then presents the appearance of a solid ladder-like structure with platforms at intervals all the way up, stretching out like drawbridges, to provide a safe and easy means of escape from any window of the building. These platforms may all be used at one time if required, while at the summit of the tower the firemen can project streams of water upon the blazing building from an advantageous position.

'A CENTURY'S PROGRESS IN ASTRONOMY.'

Under the above title, Mr Hector Macpherson, junior, has published through Messrs Blackwood a volume into which he has compressed a large amount of valuable information on the marvellous. progress made in astronomical knowledge during the past hundred years. William Herschel's work as a pioneer, to whom in the main this advance is due, receives adequate notice, as well as what has. been done since in connection with the sun, moon, inner and outer planets, comets, meteors, and stars. Our understanding reels at the thought that our universe is but a point in the infinite. Since Herschel thought the sun was a cool, dark globe, surrounded by luminous atmosphere, our conception of it has changed to that of a vast central world over a million times larger than the earth, probably a world of gases, where most of the metals and. metallic bases that we know exist only as vapours, even at the sun's surface hotter than any furnace on earth, and getting still fiercer heat for every mile of descent. There a mighty conflict goes on unceasingly between imprisoned and expanding gases, and we are told that for millions of years uprushes and downrushes of the white-hot materials have been proceeding on the white photosphere which gives us light and looks such a picture of. calm and quiescence. In the catalogue of names we find that of our contributor Mr Alexander W. Roberts, D.Sc., of Lovedale, the value of whose work was acknowledged by the president of the British Association.

NON-INFLAMMABLE CELLULOID.

A substance which shall possess the valuable properties of celluloid without the very great disadvantage of almost explosive combustibility has long been the dream of inventors. According to a note in the English Mechanic, the problem has recently been attacked with success in a manner which appears to have the charm of simplicity. The process apparently consists in adding to the celluloid during manufacture, and while it is in its most liquid condition, a quantity of some salt, such as bicarbonate of amnionia or magnesium, which has the property of evolving under the influence of heat a quantity of gas which stops the process of combustion. It need hardly be said that if a non-inflammable celluloid can be manufactured as easily as this it will be of the greatest industrial importance; but it has been several times pointed out in these columns that celluloid is virtually an explosive, for it possesses in itself all the materials necessary to combustion, and therefore does not depend upon the oxygen of the air. It is plain, therefore, that if burning celluloid is swamped in carbonic acid gas it will still continue to burn, and the gas will have but little quenching effect upon it. It appears very questionable whether the new material will be as non-inflammable as it has been claimed to be.

CANADIAN CHEESE.

There is one of our products of which Canadians have no doubt, and that is cheese, writes Miss Jean Graham in the Canadian Magazine. Denmark may be able to show a better record for butter; but when the subject is cheese, Canada knows that it is unmistakably, if not easily, first. At home we are using cheese in a variety of ways unknown to our grandmothers. Its desirable qualities in any of the dishes known as 'savouries' are becoming known, and the demand for all the finer varieties of cheese has increased fourfold in the last ten years. We all know that Welsh rabbit has been considered as dangerous a midnight dainty as threatens the human digestion. But this is all a sad mistake, an idle prejudice. Properly made, the Welsh rabbit is a thing of deliciousness and a joy for ever. Every one knows that macaroni demands cheese, and that apple-pie simply craves such an accompaniment. Celery also is a lonely course without a small jar of delectable creamcheese in the neighbourhood. But tomatoes, especially when baked, are especially enjoyed by many vegetarians if there be just a suspicion of grated cheese; in fact, this dairy product is just beginning to come into its culinary own, and is going to find its way into salads, savouries, and even soups to an extent undreamed of in the comparatively cheeseless days of the past. The traditions of Cheshire may yet yield to the modern wonders of the Canadian product.

ST PAUL'S.

There is no cathedral, if we except Canterbury perhaps, which holds a warmer place in the affection and interest of the English people at least than St Paul's, London. Our literature alone confirms this statement, for it abounds in descriptions and references to the traditions and legends of the old church and its environs. Remembering this, and the innumerable books written on the subject, we must conclude there is small excuse for ignorance on the part of any one; still less, some may think, for another volume. Yet it is good to have a concise history in a handy, readable form. The average man's ideas, however wide his historical range, are too often vague and but ill-arranged when he comes to particulars. Hence Methuen's Little Guide to St Paul's, by Mr George Clinch, is peculiarly acceptable in supplying this need. The book does not claim to be original or contain any new matter, but only to gather information from the various sources, and present a clear, useful, and comprehensive account of the church which will be interesting not only to those on a first visit but also to those who are already familiar with this 'ancient, holy, and sequestered pile.' This Mr Clinch does most admirably, and the volume, including illustrations, is no unworthy successor to the other Little Guides of the series.

A TRAMP'S NOTE-BOOK.

George Borrow, Jefferies, R. L. Stevenson, Thoreau, and John Burroughs have all written with insight and enthusiasm of an open-air life. It has been pointed out that the most living books of the world have been written by tramps. The Rev. A. N. Cooper, vicar of Filey, Yorkshire, by his long tramps and by the books which he has written about them, has come to be called 'The Walking Parson. In a characteristic article, 'A Tramp's Lesson-Book, in Chamber's Journal for July 1906, he related how he had educated himself by walking over the greater part of Europe, and therein he dropped some useful hints as to keeping one's eyes open and picking up knowledge by the way. His latest volume, With Knapsack and Note-Book (A. Brown & Sons, Hull), is also suggestive and entertaining as he travels lightly from one place and one subject to another, dropping shrewd remarks in passing. He points out how fond Germans and Danes are of eating and drinking; he describes how he climbed Ben Nevis, walked round Holland, and how he fared in Belgium and on the Rhine. He mentions the remarkable case of a young lady over whom he read the prayers for the dying, and whom he afterwards met as a happy bride in Italy. A residence at Brixen, a town in the Tyrol

on the Brenner railway, had worked wonders. Being blessed with excellent health himself, he is interested in those who are trying to find what he never lost. This young lady found life and

health by open-air, cold baths, and Spartan treatment at a hydro at Brixen. 'The Walking Purson' is a cheerful, healthy-minded person in print, as on tramp.

MAKING THE SPEAK. DUMB

T was the 1st of November, and behaving 'as sich,' when my friend and I wended our way to the School for Deaf and Dumb at No. 11 Fitzroy Square. We were too early

for our appointment, but knocked at the door nevertheless, preferring the cosy miting-room and its newspapers to the muddy sreus for the quarter-hour we had miscalculated. There, accordingly, we deposited ourselves and Jory, a stuffed New Zealand paroquet which ar friend had brought for behoof of the pupils.

While waiting we had incidentally our first Exerction of the 'oral' method. Some one was teaching in an adjoining room—a lady with a dar, telling voice and a perfect enunciation. She rs sying, 'Some of the berries we find in the size are wholesome and some are poisonous. The sentence is stamped for ever on our brains. in the hedges-berries -iemes-berries.' Dull, inarticulate echoings from ateni voices. 'No, not perries - berries. What in lemes? More responsive murmuring. 'Yes, right Berries! Some of the berries we in the hedges-berries we find-find-findic bernes we find in the hedges—in the hedges the hedges-hedges-the berries we in the hedges'— And so on, and so on, id so on, over and over and over again, till we ta in paroxysms of silent laughter; though, oked, it was no laughing matter, but rather a ind of the truth of the saying, 'For the successful sking of the deaf three gifts are necessary: is patience; second, patience; third, patience. ent on to another never-to-be-forgotten about the mantelpiece being made of table, but came back to their berries again and sa; and when the appointed time came and n at the waiting room, we were followed upstairs the clear, insistent statement that 'Some of rice berries berries we find find find is hedges—in the hedges are itizane, and some are poisonous.' Neither of ever forget the fact.

la his cosy study, hung with pictures drawn tris papils, we found the director, Mr Van Renial, frank, and kind, the man who he done more than any other for the teaching designates in England. Since 1867 he has tireated the system in London, and since 1872 be been director of the school and trainingfor teachers established by the Association by the Oral Instruction of the Deaf and Dumb.

'Deaf and dumb,' however, is a misleading phrase, as Mr Van Praagh is constantly pointing out. Very few human beings are 'dumb,' in the sense of being voiceless. The voice is there; but, owing to deafness, the child cannot-except by such a system as this-learn to control it or use it in articulate speech. Our old familiar friend the 'deaf-and-dumb alphabet,' beloved of schoolboys far from dumb, has no place in the oral system, nor are signs of any sort used. The children are taught to observe the motions of the speaker's lips, throat, and face, and by imitating these to produce the same sounds, and so at length to speak articulately. As an ordinary little child learns to speak by imitating what it hears, so do these little deaf children learn to speak by imitating what they see. How perfectly

they do it is a miracle!

The choice of beginning at the highest or lowest class being given us, we preferred the lowest, and were accordingly shown into a room where three little girls of five or six were having their first lessons. One was only a beginner and had scarcely begun to articulate. She gobbled and mouthed in the painful fashion of dumb children; but though she showed much demonstrative affection for the director, she refused to illustrate the system. Though, indeed, I am not sure that she did not. I was told by one of the staff that this power of winning the affection of his pupils has all along had much to do with Mr Van Praagh's remarkable success, and I found myself wondering whether the eager little person had not given us the keynote of the system after all! However, as she refused to be disciplined, she was sent back and another little one brought forward. She had acquired the art of breathing properly, and had learned, by blowing little paper windmills, some control of her lips and breath. She could say ah-ah-ah, and even put a p before it, and say pa-pa, the first and easiest sound to be acquired. I heard a pathetic story of a gentleman from a distance, whose little dumb daughter had been boarded in London in order to attend this school. After a time he came to see her, sorrowful enough, and not daring to expect much; and when he came into the room she ran up to him, looked up in his face, and said quite clearly, 'Papa,' The effect on him was such that my friend's voice faltered in telling of it.

But our little girl, though she could not say much, could hear a great deal, deaf as she was. 'Open the door,' said Mr Van Praagh, and she ran to do it; 'Go to the window,' and off she trotted, then came back and fixed her bright little eyes on his face, waiting expectantly for the next order. It reminded one of an intelligent doggie asking to have another stick thrown for him to fetch. 'Bring me some soap.' Off she ran to the shelves where lie all sorts of articles used in giving object-lessons, and after a little searching and climbing on a chair to reach the higher shelf the soap was found and brought. 'Now, write it down;' and she took a piece of chalk and wrote 's-o-a-p' on the blackboard. The first child, roused to emulation, now indicated a wish to show what she could do, and after several attempts managed to approximate to ah-ah-ah. It was enough to show that she could learn.

In the next class the children were writing, and we read some of their compositions, neatly written, creditable productions. Farther on was an arithmetic class where questions of the 'How-manyounces-in-a-hundredweight' type were not only heard (or, rather, lip-read) but answered with amazing alacrity. One boy, on being told our names, wrote them both down in chalk. The R was first understood as L, but at a second repetition the mistake was corrected. It was curious to see Mr Van Praagh once or twice talking to them without using the voice, reminding us of what it was very easy to forget-that sound did not exist for them, and that to frame a sentence with the lips was all that was wanted.

To one young class the director showed his watch, asking what it was made of. They seemed at a loss, but one hazarded 'Wood.' 'No, no. A metal.' 'Tin,' suggested somebody, to Mr Van Praagh's pretended indignation. It was explained, however, that they had not yet learned the word 'gold;' and the director thereupon taught it to them, repeating it over and over until every one had caught the pronunciation, telling and showing them its colour, and finally making them write it. So their vocabulary was the richer for the incident.

In the highest class a lesson in physics was going forward, and the movements of the heavenly bodies were the theme of discourse. The pupils at this stage spoke quite frankly and readily, though in some cases with a monotonous and peculiar intonation. I had some conversation with a bright-looking boy who brought me a sheaf of paintings to look over. Only once he said, 'I do not understand,' and then I found that I had been speaking with my face partly hidden behind the illuminated sheet I was examining. He understood at once when he could see either front or side face.

The pupils, of course, cannot be grouped according to age, as some have only begun after being well-grown. We saw one young man with a budding moustache painfully tracing his letters, poor fellow! beside some merry little grigs of nine or ten. In the highest class, after eliciting the fact that the earth went round the sun once a year, the teacher asked one or two of them, 'Then, how often have you been round the sun?' One answered, 'Seventeen

times; 'another, 'Eleven.' There is, of course, no method of calling the attention of any one you wish to speak to except by touch, or by making some peremptory motion that will catch a wandering eye. But once they know they are being addressed their eager eyes scan one's face with a watchfulness which I could fancy to be almost embarrassing if one did not know the reason.

The drawing and painting, the boys' woodcarving, and the girls' needlework have, of course, nothing to do with speech or hearing, and are merely part of the ordinary school curriculum. Mr Van Praagh aims at turning out lads and girls equipped in all points for an ordinary share in ordinary life. For this reason he prefers dayschools to boarding-schools. Boys and girls who live at home are under the charge of their parents, their natural and responsible guardians; also, they have fuller opportunities of becoming familiar with ordinary everyday life and of reading the lips of all sorts of speakers, and of developing into normal members of society. It is marvellous that it should be possible, and only seems the more marvellous when one sees the actual process. For my part, when I thought of the deaf-mute of former days, untaught, undeveloped, scarcely to be known from an imbecile, and then looked at these intelligent, companionable young men and women, I felt a kind of reverence for a labour which is almost like the creating of human souls.

YET, O STRANGE HEART!

HERE, hemmed by mighty mountains, and by trees, A winding valley opens far along; Here the height-sweeping storm becomes a breeze, The cascade's distant plunge a drowsy song. Here flocks and herds wax jubilant and strong On Nature's wild profusion, broadly sown; The cows, which up the river-pathway throng, Their cumbrous udders feelingly bemoan: A land of rural bliss, to poverty unknown!

Yet, O swift river! could thy course be mine; Yet, O strange heart! still yearning wistfully; O restless eyes! that range the rugged line Of peaks majestic-longing for the sea-That low, dull stretch of uniformity Which laps the solemn strand where I was born: Gray Shetland! thy grim spell takes hold of me. Here dwell I, right by Amalthea's Horn, Grandeur and joy around, yet inwardly forlorn. ERIC DUNCAN.

SLIOCH'S TREASURE.

By D. M. LEWIS.

CHAPTER I.

boys are to leave our home in London early next week to pay their first visit to Scotland, and I have promised that they shall carry with them my one story—the story of the finding of the old sea-wolf Slioch's

treasure, properly set forth in black-and-white, for the delectation of their cousins. I have told, my loys that, as they have heard the tale so often, they sight to be able to repeat it themselves; but Jack starily maintains that he never can remember that happened before 'Commander Hardy dived into the sea and didn't come up again for hours and lours, and Charlie says he always comes to the bit about the skeleton far too soon. It is evident there say; and this, then, the account of what happened dring my first visit to Scotland, is what my boys at to carry with them on their journey north. They are good lads, but I am glad to think they are tat going to stay near the sea.

Once upon a time—they will like the familiar unmencement—I stepped from the gangway of the di Cananan into the gig of the steam-yacht Senta, binging to my father's cousin, Admiral Benbow, is whose shooting lodge at the head of Loch E-The Clansman had stopped about a alk outside a wild and desolate-looking shore, and belies feeling of being uncomfortably near the ruler, and a strong desire to clutch at anything, passed me as I saw her smooth black hull slide ing from our rocking boat. About a hundred luis away lay the Senta, and as I stepped on her tel lelt a confidence in myself and a contempt wak-kneed humanity I had been a stranger to ally a moment before. The captain grinned as Feeted me, and, with a smothered apology, lamply turned away and mounted the bridge. A Marat more and we were heading straight for the lad, where a line of towering black and broken da compelled the eye's undivided attention, and the appeared to draw the yacht inshore as with

the insistence of a magnet. Soon the eye was no longer the only sense enthralled. A note stole into the ear, full and soft at first, but growing ever deeper and harsher as we approached the cliffs, till soon the very rocks seemed to bellow for us as their prey. One short minute more and it seemed to me our reckless course straight to destruction would be run. I turned to the captain with a shout in my throat barely stifled as I saw him watching me with another of his confounded grins. He calmly expectorated almost into the surf as he said soothingly, 'Ay, it's a kittle place;' and as he spoke he slightly raised his left hand. I dimly heard the whir of the wheel as the vessel turned sharply on her heel, as if in disdain for all the rocks in creation, and then realised that we were swiftly steaming at right angles to our former course. Soon we entered a broad channel between two reefs of partially submerged rocks; and, watching the gulls circling in the bright sunshine, I felt my recent fears shelling off. But a last trial of my fortitude awaited me. The channel was rapidly becoming narrower, and now, little more than a stone's-throw from the bow, seemed to be obliterated by the reefs closing together with the snap as of the jaws of a shark. I again caught the captain's eye in the course of his monotonous tramp, but this time no grin shamed me into courage. His face was stern and set, and at what seemed but a single word (so rapidly was the order given) two sailors stood by the man at the wheel. Intently these men watched the captain as they held the spokes of life or death motionless in their grasp.

For a breathing-space I turned sick and dizzy as, with the spray of the breakers falling on her deck, the yacht faced the hungry rocks. As in a vision I heard terse orders ringing with insistence, and saw the great wheel spin round from port to starboard, from starboard to port, as if in a frantic effort to wrench itself free from the doomed vessel. Then, for a second, the silence of the grave, and we were safe!

tion, and As my eyes cleared, two of the sailors had left the as with wheel and were sauntering for ard. The one left [All Rights Reserved.]

As my eyes cleared, two of the sailors had left the sail

was cutting a quid of tobacco, with no eye but for its noble proportions; and the captain was at my elbow suggesting an adjournment to the cabin for lunch. Bewildered, I looked round, and saw we were gliding into a loch of heaven-reflecting smoothness. Behind, indeed, snarled the rocks we had just won through; but in front smiling hills with gracious rounded bosoms stooped down to welcome the dalliance of the waters, and elemental strife seemed for ever ended in the clinging embrace of land and sea.

Reluctantly I followed the captain to the cabin, where, reassured by the peaceful scene I had just left, I did ample justice to a substantial lunch. That finished, we returned on deck to smoke, and I found we were now heading up a winding sea-loch. But what a changed scene met my eyes! The hills had grown into mountains, and, as if with advancing age, had become wrinkled and rugged. Above, they sullenly barred out the sun; below, they defiantly thrust themselves out against the sea. And she too had changed. No longer with softest murmur did she seek the shore; but, with the blind vindictiveness of a woman scorned, she struck blow after blow at that earth which would now fain cast her off, and raged and fretted in her impotence. Now the earth gaped wide as some dark cavern showed black against the advancing foam. A moment later, and the sea, thundering in her wrath, leaped in at the breach. Then earth put forth his strength, and, bellowing, spat back the sea with scorning spume. But not always did he thus repulse the ceaseless sea. There, like one of earth's mighty hands stretched out to choke her, but palsied by her stroke, lay a huge rock, stricken and helpless save for some faint struggle which only served to weave a shroud of white against its death.

Shuddering, I turned away from the monumental embodiment of human strife, and eagerly looked ahead for some more peaceful scene. Nor was I long to be disappointed; for, as we slipped round a projecting headland, there, full in the cheerful sunlight, nestled a small village, with cottages lying like shells on the sandy beach at the head of the loch. My eyes were hardly accustomed to the kaleidoscopic change when I heard the anchor rattle out the cable; and a hail from an approaching boat announced the coming of my great friend Jack, Admiral Benbow's son, to welcome me to Eriboll. As I thanked the captain and said good-bye, the boat came alongside; and soon, seated beside Jack, I was pulled to a small pier on which stood the Admiral waiting to receive me. He gave me a most hearty welcome, and at once introduced me to his companion, a very uncommon-looking man, apparently about forty years of age. 'Hardy, let me introduce Charlie, the son of my cousin John Murdoch, to you.—Charlie, this is Commander Hardy, who served under me for many years. He is staying with us just now, and, upon my word, he can tell you more about the place than I can.'

As Commander Hardy cordially shook hands with me I felt a curious sense of physical smallnesscurious because I looked down on a man at least four inches less than my six feet. I puzzled over the feeling I for the moment could not understand; but as, sauntering up to the Lodge, I took in the breadth and depth of the man walking before me, I felt that I was in the presence of indeed a strong man. The huge bulk of his body, most remarkable at the chest, was carried by legs like the quarters of a horse, terminating in a pair of the largest and flattest feet I ever saw. His arms were long, with the forearm very fully developed, and the hands short but broad, thick, and muscular. His build so occupied my attention that it was only when I sat opposite him at dinner that I noticed his face. It was plain and pronouncedly Scotch, but pleasant withal, the principal features being the eyes (big, deep-set, and of light blue) and the nose (large, with unusually wide nostrils).

That evening, as we sat in the smoking-room after Mrs Benbow had said good-night, I (as the Admiral assured me all new-comers did) asked about the dangers apparently attending the access to the loch from the sea.

'Ay,' replied the Admiral, 'I have no doubt, Charlie, you got a fright coming in. To tell the truth, the only drawback to this place is the access from the sea. It used to be much more difficult before the channel was buoyed; but even now it is sometimes ticklish work bringing in a yacht, unless, indeed, like Captain Corbett, you have known every inch of the channel at all states of the tide for years. I never saw a more puzzling entrance to any safe anchorage; but when you really know all its outs and ins it is quite safe. How, however, any one could constantly use the channel before it was buoyed I don't know, and yet they say it was used for years and in all weathers by that ancient sea-wolf Slioch. If so, I can easily understand how, apparently miraculously, he used to give his pursuers the slip.'

'How long ago is that?' I asked.

'I believe his career ended about the end of last century; but Commander Hardy knows far more about him than I do. Last summer, when he was here for the first time, he was immensely interested in all he could hear about the old ruffian, and spent a small fortune in tea and tobacco trying to collect information from the old people in the district. I've no doubt that much that he heard was told him more out of gratitude for his presents than regard for the truth; but during the winter he has managed to get from various authentic records some definite information which certainly points to Slioch having been a most successful old pirate. Most interesting of all, though, just before he came here he ascertained by the help of a friend in the Admiralty Office that beyond a doubt Slioch was killed and his vessel destroyed near the head of the loch in September 1790.

'Come on, Hardy,' finished the Admiral; 'this is study night, and we are never rash at rising or Sanday morning. Let's have a full, true, and particular account of all you have found out about ice old scoundrel and his works.'

The Commander smiled for a moment, and then turned grave. 'I have done little or nothing but think of Slicch and his treasure since I came here, he said almost as if to himself, and sat eying a sacient sword on the wall as if unconscious of our presence. In a second or two he gave a short high, and speaking very earnestly, and as if deeply micrested in the subject, said:

'Leaving out in the meantime all that is merely traditional, it is indisputably true that in the year 1788, if not before, there began a series of aviserious disappearances of vessels, which abruptly ealed in the autumn of 1790. All the vessels disspeared between Cape Wrath and Loch Ewe, and sem generally to have been missed towards the care itheday. At first nothing more seems to have ben known than that certain vessels whose course ky through the Minch were never heard of after Maing Cape Wrath, and it was not till 1789 that ESPICION Was definitely aroused that the disapparasee of these vessels might be due to other than ext of God. In that year a Captain Macdonald mated that he had been chased and fired at off Let Enard by a comparatively small vessel, which, Lan quite near him, had abandoned the pursuit to mespectedly as she had commenced it. News, action travelled slowly in those days, and vessels all continued to disappear without any organised n pair being made. It was not till the beginning C the year 1790 that the disappearance of certain cases came to be associated with the presence of a ha lying ressel, painted light gray and very heavily pared, occasionally seen by fishermen off Loch Land At length the Admiralty was induced to kai a large brig, commanded by a Captain Vincent, a purol the north-west coast; but for some time the Fere missing, although not nearly so fre-Faily a before Every nook—as Captain Vincent aght-between Cape Wrath and Kyleakin was satisfic without a trace of anything larger than a tag loss being found, and officers and men alike at their wits end, when a midshipman in comand of a boat sent ashore for fresh-water reported that a sailor named Johnstone (one of the crew of is missing vessel) was living in the village a Redeal Captain Vincent at once landed, and is merriew with the man disclosed the following

Johnsone was boatswain of the schooner Martha at May, which about an hour before sunset a saiding in towards the land on the star-wards. When about two miles from the shore is an on the lookout reported a sail on the wards. When a minute all on board saw a saying gray in a minute all on board saw a region of canvas coming towards them from the sac. Presently she shot past; but as soon as she

got the schooner between her and the shore she put about and fired a broadside at the Martha and Mary, which carried away the mainmast, killing two men and totally disabling the schooner. Spinning round like a greyhound when puss doubles, the yawl ran alongside. Grappling-irons were thrown out and the schooner boarded by a rush of men, who, after a feeble resistance, killed all on board with the exception of the boatswain, who had been knocked overboard at the first onslaught, and afterwards picked up by a fishing-boat and brought to Badeal. All this had happened only three days before; but no further information could be got except that, though the fishermen who had rescued Johnstone had heard the sound of guns, they had not seen any vessel. However, from the boatswain's information, the precise spot on the shore from which the yawl had suddenly emerged was definitely ascertained; and next day the brig dropped anchor as nearly as may be at the place where the fight had taken place. Three boats were sent off thoroughly to explore the shore, and two of them returned towards sunset without having discovered any place capable of sheltering even a dingy; but when, about an hour later, the third boat came back, the officer in command of her had an extraordinary story to tell. He had, he said, reached, as he thought, the end of a channel parallel to the shore, and the men were lying on their oars while he took a final look round before giving the order to return to the brig. Just as he was about to sit down, he was startled by noticing that the boat was slowly drifting nearer the rocks at the end of the channel, as if carried by a regular current. Stationing two men in the bow with boat-hooks, he allowed the boat to drift on, and just as the rocks seemed about to close in the channel a sudden swerve of the boat disclosed the entrance to a loch. He made a careful examination of the passage, and ascertained beyond a doubt that it was possible for a vessel to enter the loch from the sea

'By daybreak a strong force was despatched in boats to explore the loch; and as Captain Vincent tersely describes it in his despatch : "We sighted a low-lying, gray-painted yawl at anchor near the side of the loch, and were at once fired upon, losing two men. Dividing our force in two, we boarded the yawl at bow and stern, and after severe fighting captured her, with the loss of sixteen men. All her crew were either killed or severely wounded, with the exception of one man, who at the very last jumped overboard and swam towards the shore. He was not seen to land. I was on the point of telling off a party to search the yawl when she began to sink by the stern, and we had just time to take to the boats when she went down, having evidently been scuttled."

'This, of course, ended old Slioch's career of piracy, during which it was estimated by the Admiralty that at least fifty vessels had been captured and sunk by him. The plunder obtained must have been very great, but no trace of it has ever been found.

'So much for facts; and only three points need I trouble you with of tradition. The first is that he who would find the treasure must first find the yawl; the second, that the treasure, though hidden on dry land, can only be reached by swimmingthese points run through all the verbosity of the very old people about here who profess to remember hearing the treasure discussed in their youth; the third is, that the man who escaped from the yawl returned to the village after the departure of the gunboat, and lived there idle, but apparently prosperous, for more than a year. During that time he occasionally disappeared for two days, but would give no account of where he had been. He finally disappeared for good and all about fifteen months after the capture of the yawl, and was never heard of again. Old Malcolm is said to be no other than the only son of this man.'

I broke the silence which ensued after Commander Hardy finished by asking who Malcolm was.

'Old Malcolm?' replied the Admiral, as he knocked the ash out of his pipe. 'Well, you'll see him to-morrow; but even Hardy can't make anything out of him. He was for a great many years the captain of the yacht which belonged to the former owner of this place, and was pensioned off about fifteen years ago. He lives in a small cottage on the shore, and is supposed to be well over ninety years old. I believe he sleeps all through the winter, and only comes out when my yacht arrives. Then every day he sits on a seat near the small pier watching the loch, and mumbling occasionally to himself. He will thank you if you give him some tobacco or (what he evidently likes better) a "dram," but beyond that you can make nothing of him.

'And now, if you don't want another smoke, I think we should all retire. Be sure you dream where the treasure is, Charlie, and we'll get it on Monday.'

I awoke early next morning (Sunday), and getting downstairs nearly an hour before breakfast-time, sauntered down to the shore. It was struck at once with the feeling of the air. It was stagnant, hot, and dry, as if it surrounded some unseen furnace. It was not the healthy heat of heavenly sunshine; it felt rather as if it came from below—as if the earth's crust had suddenly thinned, and you felt the glow of its eternal fires. Dark masses of cloud lay huddled together, as if from fright, in the far east. In the west, the loch shone like copper. North and south were claimed by the towering hills, and my eyes rested upon them with a quick sense of protection. As I gained the beach I noticed that the yacht was not lying at her moorings, but at anchor

about two hundred yards farther out; and as I watched her I saw a boat put off and make for the landing-place. There I waited; and after seeing the boat made fast, the captain joined me, and as we walked up towards the house together he explained that all hands, with the exception of two left in charge on board, had come ashore for the purpose of attending communion service in the parish church. As the church was about six miles away, I expressed my surprise that so many of the men were willing to walk so far on such a hot day; but the captain, in terms which echoed rebuke, assured me that, whatever the heat might be, not only his men but every man, woman, and child in the village would be found at the church that day. 'All the same,' he continued, 'we might be in the China Sea just before a cyclone; and yet the glass is high and fairly steady. Darn me if I like the looks of the weather anyhow.'

'If,' I queried, 'a storm does come on, is the yacht quite safe with only two men on board? I see you have anchored her outside the moorings.'

'Yes,' he nodded; 'I did that to make quite sure, for the first thing we do to-morrow is to overhaul the moorings. The collier that brought the coal up on Friday didn't do them any good. But safe? Why, no breeze that ever blew in this country can stir her, unless it comes over the top of old Ben Beannach, and that never happened yet.'

'Well,' I replied, 'I hope the road to church will be as safe. And now, as it's about breakfast-time, I must go in. Are you starting soon?'

'Ay; we sailors are slow walkers. You'll be driven, so you needn't start for a while yet. Well, good-morning, sir.'

At breakfast the conversation naturally turned to the weather; but in the face of the high barometer no one seemed to have any great anxiety about the day. Commander Hardy, it is true, seemed to think some serious change imminent; but the Admiral pooh-poohed the idea of anything but heat, and remarked that if we had seen all the extraordinary skies he had seen at Loch E- we should be content to admire them. By-and-by the wagonette in which we were to be driven to church came to the door, and-with the exception of the Admiral's wife (who felt unable to face the long service on such a hot day) and Commander Hardy (who compounded with the Admiral by entrusting him with a sovereign for the plate)—we all started a little before eleven o'clock. Little did we think of any change of scene as a turn of the road shut out from view the placid loch mirroring the yacht lying idle as a painted ship upon a painted ocean.

(To be continued.)

LONDON CABS.

By W. J. GORDON.

THE London cab-trade is in a bad way. It is being crushed out of existence by the railways, the trams, the omnibuses, and—so some of those in the trade would have us believe—the taxation of twopence a day which

every cab has to pay. Think of it : plate-license, two pounds; wheel-tax, fifteen shillings; driver's hense, five shillings-three pounds a year in all. When the trade 'cannot stand that' things must be shiry indeed. Evidently matters are urgent, and Ladon is in danger of becoming a cabless city, as it vs before Captain Bayley started his hackney carrags in the Strand some three hundred years ago. it is a curious trade, a sort of jobmastering issues limited by license. The driver is not trated with a cab until he has passed an examinabe in London topography—'unnecessarily severe,' omplain the masters; 34 per cent. of the candidates ar seat back, some of them slipping through after is fith or sixth attempt. Here is a subject for a bustness presentation-plate that has escaped the Mice of our artists: 'Studying for an Exam.'a rould be cabman poring over a map of London, is it is by the map that the candidate is tested. and why should there not be a map of the county and varnished on the roof of every hansom is a help to him when he is in the business?

la his license his personal appearance is described, ort of vague description that would serve for ems of men; but this it is proposed to alter, and is the future he is to be photographed at the exhas of the police to prevent his badge from being ted by an unlicensed man. He takes his license the cabmaster, leaves it as a security for payment, oisgren a cab ready for work, for which on an tage throughout the year he pays eleven shillings of threepence a day should it be a hansom, and ul a guinea should it be a four-wheeler.

How much he earns is a mystery. It used to sense nearly three pounds a week; but since the sund of 1894 there may have been a change, and of the drivers now work only five days a tet, and seem to thrive on it, though the masters n ad, for the basis of that award was that each the should return a margin of profit of a shilling a at alcolated on a working week of six days, and is tre. The masters, however, do not do all the Take; of the three thousand licensed cab-owners and handred and sixty seven own three or more as the bulk of the business being in the hands of mail men who drive their own. The cabs are citally eleven thousand in number, the hansoms tagivice as numerous as the four-wheelers; and stated drivers number about twelve thousand immdred not enough, say the masters, allowing is stress and holidays, to take the cabs out.

Really, the profit is little; and, be the causes what they may, the masters are fewer every year, the cabs are fewer, and the drivers fewer. At the same time, the London cabs were never so good as now, thanks to competition and police inspection; and the average value of hansoms and four-wheelers, new and second hand, taking them all together, is not less than a hundred pounds, of which thirty are accounted for by the horse and the rest by the cab and harness. When new, the hansom alone may have cost a hundred guineas.

But no stock of cabs can be worked with one horse apiece, for no horse can be kept going for more than six days a week, and there must always be a spare one or two for emergencies. And a cabhorse has to be well fed-a hansom-horse will take a sack of corn a week, and necessarily so, for it is a poor week in which he does not travel over two hundred miles with his half-ton weight behind him-and an increase in the price of forage makes all the difference between a profit and a loss. It used to take two horses a day to work a cab, the man returning for a fresh horse during the afternoon; but in these days, when the cab comes back it remains, and one horse a day is enough for it. This, however, does not hold good in railway work under the privilege system, where the master is under contract to supply a fresh horse whenever required.

The privilege system arose owing to the difficulty experienced by railway passengers in obtaining an adequate supply of cabs at all hours on every day of the week. To get the passengers and their luggage away from the stations the railway companies contract with certain cab-owners to supply so many cabs for this special purpose throughout the year, these being the only cabs allowed to stand on the company's premises. The system has the advantage of providing a good supply of cabs for all trains, and the disadvantage of arousing the envy of every cabman who brings a passenger to a station and has to drive empty away, except when there happens to be more work than the privileged cabs can cope with, when he may be called in to assist.

The owners pay for the privilege, and the terms vary considerably. At Clapham Junction, for instance, a lump sum of forty pounds per year is paid for supplying fifteen cabs. At most stations the charge is three shillings a week. At Paddington it is three shillings a week (with one pound deposit, returnable when the privilege ends), at St Pancras it is two shillings a week, at Euston and Marylebone it is eighteenpence a week, at Waterloo (South Station) it is two shillings a week, while at Waterloo (Main Line) and Vauxhall there are no contracts, and any cab can take its place on the rank on payment of one penny. The peculiar

arrangements at Waterloo are explained by its nearness to the Strand, where cabs are plentiful, those calling in at the Main-Line Station averaging nearly a thousand a day; but cabmen neglect the South Station, where the cab-riders are neither so numerous nor so profitable, and hence the privilege method had to be introduced there. The largest privilege station is Paddington, which has two hundred and ninety cabs; Euston has one hundred and eighty-two; Victoria (Brighton) has—like Charing Cross—one hundred and sixty; King's Cross has one hundred and thirty, St Pancras one hundred. Formerly a privilege cab taking a passenger to another station had to return from thence empty; but now, owing to the railway companies working together, it can line up with those that are there. One of the recommendations of the recent parliamentary Committee on London Cabs and Omnibuses is that the privilege system should be suspended for a year in order to see if the railway work can be satisfactorily done without it, as the unprivileged cabmen say that it can.

The report of this committee tells the public many things of interest not generally known, and the reason thereof. For instance, the radius mystery is now made clear. Within the four-mile circle round the Charles the First statue at Charing Cross the fare is sixpence a mile; outside it the fare is a shilling a mile. Nothing could be simpler; but if you hire your cab outside the radius the fare is a shilling a mile all the way. Thus it costs you three shillings and sixpence to go from Charing Cross to Highgate, and five shillings to come from Highgate to Charing Cross. Further, the shilling rate begins, not at the radius, but at the last completed mile within it, and in this way is accounted for the scarcity of cabs within the half-mile inside the radial boundary compared with their numbers on the other side of it. Strangely enough, several of the committee were unacquainted with the radiusmarks, and the inquiry seems to have been held in a room in which there was no map of London with the radius shown, so that some time was wasted in asking questions which could have been solved at a glance. The committee recommend the retention of the radius, and on the matter of fares refer the reader to paragraphs 89-108; reference for which he is not likely to be as thankful as expected, owing to the paragraphs of the report not being numbered. The table of fares proposed is, however, easily discoverable. Shortly stated, it means sixpence for the first half-mile and a penny for every additional sixth of a mile. So the first mile will

cost ninepence, two miles fifteenpence, three miles one shilling and ninepence, and so on. One would like to see the face of the cabman when a rider alighting within three and a sixth miles and three and a third offers him two shillings, and asks for the penny change. These rates are to be doubled outside the radius, but the increase is to be taken from the nearest sixth instead of the nearest mile.

There is the usual complication of fares by time; but these, as well as the distance fares, are to be simplified by the use of the taximeter on the hour-mile system which it is proposed should be introduced. This much-talked-about instrument is a combination of a clock and a distance-indicator such as is used on cycles, but on a larger scale. A lever stands upright on it when the cab is disengaged; when a passenger enters the cab the driver depresses the lever and starts the mechanism, and at the end of the journey the figures on the dial show the fare payable.

dial show the fare payable. The taximeter, though not quite on this system, is not new to London, it having been tried on a few cabs some eight years ago and withdrawn owing to the opposition of the drivers. In Berlin, Paris, and Cologne it seems to have solved the cab-problem. The rider knows what he has to pay, the driver knows what he is earning-his earnings being a percentage, generally a quarter, of the takingsand the owner knows the distance the horse has travelled under hire, which is a matter of importance to him in the management of his stable. It will at least remove the most conspicuous failing in the present system. 'A man,' as was well said by one of the witnesses, gets into a bus or he gets into a tram, and he knows exactly where he is going and what he has to pay. He gets into a cab, and he does not. He knows where he is going, but the other thing is an unknown quantity in many instances. The cab is licensed for specific work on specific terms; but under existing conditions the cab-driver alone is judge of the work and the arbiter of the terms; and the cab-rider has no guarantee that what the driver demands is the amount he is entitled to receive.' In fact, it is worth trying, though whether it will revive the cab-trade, which suffers most from the competition of other means of communication, is rather doubtful. It means, however, more expense, an additional fivepence a day, surely an overwhelming 'tax' on an industry that cannot stand twopence. But perhaps the outlook is not so bad as it seems to those whose point of view is that the main object of civilisation is the prosperity of the cab-trade.

THE LORD OF THE MANOR.

By FRED M. WHITE.

CHAPTER VII.

the girls sat out on the Common in the full glory of the sunshine. It was a day in late September, one of those perfectly still afternoons when the air is heavy with the hum of insects and the bees drug themselves

with the saffron. Ever and again there was a wach of crispness in the sea-breeze, but the great sheet of blue lay there under the veiled light like the chimmer of innumerable jewels. From somewhere inland came the drone of a threshingmachine. The gorse was touched here and there with points of flame—the second bloom of the year; but the heath had lost its purple sheen now, hough the bracken was turning from russet-brown to gold and purple and crimson. There was never a time, May thought, when the Common lacked a santle of beauty. It seemed impossible to be anyling but peaceful and contented there; but both the gris looked a little restless and anxious, as if especting something. They were both very silent, with their eyes turned towards the sea. It was May who spoke first.

'I dare may the matter is settled by this time,'

What matter? Angela asked with a poor steam at indifference. 'I was trying to forst it May, I believe that you are in sympathy with the enemy.'

I don't recognise that Craggs is an enemy,' the mager girl replied. 'Why blame him? He is sting for the best from his point of view. And, retarrer happens, we shall not be any worse off that we are at present. Suppose Craggs loses his stin, how does that benefit us? Dad will have stablished his right to do what he pleases with the Cannon. He will be monarch of all he surveys. Is vill refuse to let anybody come here. He will regulate that hotel idea with scorn.'

But you admitted just now that you hated that

Solda Dad will do nothing; he would refuse a penui any industry here, however remunerative. Laken ness have no connection with business. The penul have no scruples of the kind. He was to win so that this classic spot can be used to be the total of the hospitallers. That is why I have he will win.

Angels turned from the speaker with a gesture

What do you want to see here?' she asked.

"Me why are we so poor? Why can't we find

"The Spanish fleet won the good of that kind?"

The Spanish fleet you cannot see, because it's at a sight," May quoted with a laugh. 'There so coal here. As you have learnt by personal

experience, I have a poetic mind, Angela. I want Craggs to win so that dad can't interfere with the Great Scheme. I have spoken of the Great Scheme before.'

'Oh, you have,' Angela sighed. 'The Great Scheme is to make our fortunes. I hardly think that dad would turn his back on a prospect like that.'

'He would. I sounded him. He pronounced the whole thing ridiculous. That is why he is to-day wasting his time and money in York defending the action which has been brought against him by the hospitallers. If he wins, then good-bye to all prospect of peace and happiness in the future. But he will not win.'

Angela plucked impatiently at a spike or two of gentian. She had heard of the hints of possible fortune many times lately. For the past three months May had been cryptic and mysterious; she had discussed Craggs's action with a smile of meaning, though she kept her secret well. And to-day was the second of the trial of the action Craggs versus Castlerayne, and at any time the verdict might arrive from York Assizes. Outwardly indifferent, Angela was inwardly in a fever of expectation. She was heart and soul on the side of her father; she would have been prepared to make any sacrifice to uphold the honour of the family.

'What is this precious secret of yours?' she asked. 'I feel sure that it is something between you and Mr Warrener. Why do you keep it from me?'

'Because I promised to say nothing to anybody. And it is Mr Warrener's idea. Mind you, he is quite powerless unless Craggs wins his action. Dad will never listen to the scheme if he keeps control of the Common.'

'Oh, indeed? Then this is a deliberate plot to bring about something that will be distasteful to us Castleraynes. A soap-factory perhaps. Or maybe a steam laundry. That would be a natural conclusion to the Warrener soap. Extensive dryinggrounds of five hundred acres close to the sea! Are you going to be manageress?'

May laughed pleasantly. She remarked that Angela looked very handsome when she was angry.

'You are foolish,' May said, 'and very narrow in your views. There will be no steam laundry and no building of any kind if you except the restoration of the Dower-House. And this lovely common will not be touched; the Great Scheme will provide for its being left intact for ever. People will come here from all parts of the kingdom; they will rise up and call the creator of the scheme blessed. Angela, what is the present value of our land that fringes the whole of the Common?'

'Really, I don't know,' Angela replied. 'Martin says the five thousand acres of ours would be dear at half that amount of money. Why?'

Because those gorsy acres are worth a fortune. Honestly, I am not joking. I know you give Mr Clifford Warrener no credit for imagination; but in my eyes he is a poet. Like me, he is a benefactor to his race. Why did he not fall in love with me instead of you?'

'It seems a pity,' Angela said, with a red stain

on her cheeks. 'If you care for him'-

'Not in that way. I could, easily enough, all the same. But he chose you instead; in fact, he told me so at the same time as he took me into his confidence over the Great Scheme. That beautiful imagination of his took in the whole thing; he saw the jewel lying at our feet, though we were too blind to see it for ourselves.'

Angela shrugged her shoulders indifferently; she turned away her head to the sea. She was too proud to ask for further particulars, though her curiosity was aflame.

'Goblin gold,' she said, with the petals of a head of gorse in her fingers. 'If this scheme would only pay some of those dreadful bills of ours, why'-

'Oh, it will. It will pay everybody; dad will be rich malgré lui. And in the course of time he will refer with pride to the brilliant qualities of his son-in-law.'

Angela rose with cold and frosty dignity. Really, May's joke was in very bad taste. And yet, deep down in her heart, Angela was a little sore and annoyed with Warrener. She had never forgotten that morning amongst the roses—the morning when Warrener had spoken so plainly to her, and she had responded with outstretched hand and a challenge to him to convert her to his side if he could. In spite of some provocation, Angela had behaved very well on that occasion, and she was cognisant of the fact.

She had quite come to admit Warrener's high qualities. He was a handsome man, too, and his family was as good as the Castleraynes. Also, he had spoken quite freely of his admiration for Angela. Also, she had not resented the boldness of his speech. And Angela had been reading a good deal of Shakespeare lately; she had been especially affected by the Taming of the Shrew. Unconsciously, her point of view had been Petruchio's. And here was the story of it all. Warrener had not been near The Towers since that June morning when he and Angela had stood face to face in the roses. Not one line had he sent the whole time. It never occurred to Angela to ask who had been responsible for all that work at the hospital or who paid for the staff of nurses who came to grapple with the demon of typhoid there. Warrener had gone away

and made no sign. He had been playing with her. The girls were by the edge of the hospital now. A figure crossed the lawn in the direction of the stone sundial, and May called aloud.

'Why, there is Craggs!' she exclaimed. 'He is back from York already. Beyond doubt the case is finished. Angela, let us go and get the verdict.'

Angela raised no objection. She was thrilled and eager to know the result. From the bottom of her heart she detested Craggs; she was a little ashamed that she should give so much feeling to so commonplace an object. Nevertheless, now her step was as quick as May's, her lips were parted more widely. Craggs raised a hand to his cap; the serenity of his gnarled old face was unchanged.

'I came back last night,' he explained. 'They said as I should not be wanted any more. I dare say as the case is done with by this time.'

'But you must be very anxious, of course. You

arranged for a telegram?

Craggs shook his head and smiled. He appeared to be exasperatingly sure of his ground, Angela thought. It was very unladylike, but she would have liked to shake him.

'Lord bless you, miss!' he said, 'there's no doubt

about it.'

'But why did you start this claim?' Angela burst out. Her face was white; her eyes were flaming with indignation. 'I call it disgraceful of you, Craggs. After all the years that you have lived on the estate, to -to'-

Angela's indignation deprived her of further speech. The slow, tolerant-not to say patronising smile did not fade from the old man's face. On the grass in the sun two little girls were playing. Craggs called to them; he laid a hand on the shoulder of each. There was something very manly and very tender about the old fellow now.

'Look at these two,' he said gently. 'Granddaughters of MacMasters, who was your family body-servant for fifty faithful years. Look at them -ain't they two pictures? Look at their blue eyes, their fair hair, and their lovely colouring. They are like the pictures as you have at The Towers.—Run away, little kittens, and go back to your play.-You ask me a question, Miss Angela, and I'll answer it. If things don't mend soon, who is going to look after the pretty creatures? What is going to become of 'em? Why, they are going to the workhouse. We are all going to the workhouse. And why? Because Castlerayne has failed in his duty to his people; he has forgotten his honour. For three steady generations you have wasted your property; you might, at any rate, have recollected those who were faithful to you, and put the money aside for the upkeep of the hospital. I tell you that was a debt of honour. The plumbago went, and then our spring of water went, and we should all be at the big house over beyond the village if it hadn't been for Miss Gertrude. Then we were dying of disease; we should have all been dead but for Mr Warrener, who found the money to make the place fit for habitation. You want me to fold my hands and do nothing, to see those dear little children that Christ loves beyond us all carried off to herd it with the scum of the town.

As for me, the hospital is my birthright. I looked forward to this home for my old age. I trusted to the word of a Castlerayne; but I trust to it no kager. And yet there is a funny side to it all.'

'Oh, indeed?' Angela said coldly. 'I confess that I fail to see it. Perhaps you will be so good as to enlighten me on that point.'

(To be continued.)

PRINCE RUPERT,

THE WESTERN TERMINUS OF THE GRAND TRUNK PACIFIC RAILWAY.

AVING decided upon Kaien Island, a few miles south of Port Simpson, as the terminus on the Pacific coast of the Grand Trunk Pacific, the management of that new transcontinental

railway set about finding a suitable mme for it. With this object, the directors offered a mix of two hundred and fifty dollars for the best Line, to consist of not more than ten letters. Over treire thousand competitors submitted names, and the award has been made to Miss MacDonald, a last whose family has been closely identified with the pioneer days of the Canadian North-West. Mis MacDonald's name for the new port, which some day be a town of great importance, is Pince Rupert, which words contain twelve letters. Two other competitors, who complied with the orditions, offered the name of Port Rupert, contaking ten letters, and to each of the three the Gand Trunk Pacific directors have awarded the tau of two hundred and fifty dollars, after deciding non Prince Rupert, though that name was not d gible in the terms of the competition.

Prince Rupert, the dashing young cavalry leader d the Caraliers nearly three hundred years ago, te really the first British-Canadian business Ligate. He was the chief promoter of the Halsa's Bay Company, and its first governor in In that year Charles II. granted a charter is the Prince and seventeen other noblemen and Fallemen, incorporating them as 'The Governor bd Company of Adventurers of England trading hudson's Bay, and securing to them the sole inc and commerce of 'all those seas and straits, ar lakes, rivers, creeks, and sounds, in whatever kinds they shall be, that lie within the entrance by straits commonly called Hudson Straits, techer with all the lands and territories upon the contines, coasts, and confines of the seas, bays, &c. that were not already actually possessed by the subjects of any other Christian Prince or the first settlements of the country thus Fazed, which was to be known as Rupert's Land, the made on James Bay, at Churchill, and at H rle's rivers.

lis to Fort Churchill that the people of western Casals are now turning their attention as the port 2 Hadson's Bay from which a trade-line of sames to Liverpool will before long be established. The Canadian Northern Railway is already point for the condition of the point of all shades of political opinion are agreed

that it should be extended to that point as rapidly as possible. The only difference of opinion is as to the means. Some contend that the construction of the railway should be under the guarantee of the Dominion Government, while others hold that the Hudson's Bay extension of the Cauadian Northern should be under the guarantee and control of Manitoba, Saskatchewan, and Alberta.

For many years the Hudson's Bay Company held undisputed sway over Rupert's Land, an enormous territory still shown on the maps of Canada until quite recent date. In 1867 the federation of Canada formed the Dominion, and it was at once found that there were great objections to having the enormous territory of Rupert's Land within the bounds of the Dominion and under the absolute rule of a British private corporation, the Hudson's Bay Company. Accordingly, at the instance of the Dominion, the Imperial Parliament in 1868 passed the Rupert's Land Act, providing for the acquisition by the Dominion of the North-West Territories. In 1869 the deed of surrender was signed confirming the Hudson's Bay Company's sale and transfer to Her Majesty Queen Victoria of the company's territorial rights in the North-West Territories. In the following year the Dominion paid over the consideration-money, three hundred thousand pounds, for the Hudson's Bay Company's rights in Rupert's Land. In the same year, 1870, the North-West Territories were formally added to the Dominion, and Manitoba (which formed part of them) was created a province, and admitted into the confederation.

In 1905 the provinces of Saskatchewan and Alberta were created from a portion of the remainder of the North-West Territories, and there is still a vast area of valuable territory acquired by the purchase from the Hudson's Bay Company vested in the Dominion Government awaiting the advance of settlement to a point when the inhabitants of this area will, in their turn, be conceded the privileges of responsible provincial government. In selling Rupert's Land to the Dominion, the Hudson's Bay Company made certain reservations, and the lands so reserved are now increasingly valuable, as is evident by the present high price of the Hudson's Bay Company's stock. When the company received the three hundred thousand pounds in 1869 for its rights in Rupert's Land the sum was considered excessive. Looking back in the light of present-day values, the smallness of the purchase-money seems ludicrous. The purchase of the Suez Canal shares by Mr Disraeli's Government is often spoken of as a masterstroke of commercial policy; but it does not begin to compare from the financial standpoint with the | Dominion.

purchase of Rupert's Land made by the first Government of Canada immediately after it came into existence upon the proclamation of the

LAKE-DWELLERS OF THE BALKANS.

By R. A. SCOTT JAMES.

T is like the sea, monsieur; only it is

more blue.'

'There they will get you fish to eat which are like no other fish in the world.'

The soldiers do not go often on the lake, monsieur. It is the only place where

there are no encampments.'

'You may be taken for five hours over the lake at night, monsieur, and there is nobody to be

frightened if you fire off a gun.'

A hundred promises had been made to me concerning the wonders of Lake Ochrida; and in all the long journey from Monastir-over two chains of mountains, across two hot, dusty plains, through poverty-stricken, pestiferous towns and villagesthe pleasant promise of Ochrida had urged us on. At length I had reached the lakeside town. I had spent a day and a half in seeing its ruined castles, its mosques, churches, and schools; I had done my duty in calling on 'the Government;' I had been rowed over to a sheltered cove among the cliffs, and had wallowed in the fresh-water at midday. And my kind Bulgarian hosts begged that they might give me hospitality for a month, for two months, for six months if I would stay so long.

'Monsieur, the Commissary of Police is at the

door and would like to see you.'

Alexandre, my young Bulgarian dragoman, was always perturbed when he spoke of the Commissary of Police. The commissary had come up from Monastir with me-nominally to control my escort and 'facilitate' my journey, but in reality to report upon my actions and keep me from talking to 'notorious' persons. This ingenuous Turk refused to be snubbed; he would not take hints; he pretended an ox-like obtuseness on some points, though "C'est mon service, amazingly alert upon others. monsieur,' he afterwards explained to me, when we had become really and not only outwardly friendly. 'Show him up, Alexandre,' I replied.

He came in among us with an elaborate bow. He hoped I had slept well; he was entirely at my disposition; his Excellency the Governor was much concerned that I should be comfortable. He hailed Alexandre with a bluffness which offended him not a little. He nodded familiarly to Nikola, my young Bulgarian host, and suffered himself to be waited on by Nikola's sister-in-law and by his elderly mother and by all the children, first unnecessarily assuring himself that every attention had been given to me.

'And what does monsieur intend to do to-day?' he asked.

'I have not yet made up my mind,' I said

evasively. 'Does he mean to go some day across the lake to Sveti Naoum, to visit the monastery?'

'Perhaps I may go. I shall see.'

For some time he talked about the fine Albanian tobacco. 'It is good for pipes, monsieur. I have bought you some.

It was not very 'good for pipes'-no tobacco in Turkey is; but I bought it from him, and I believed the commission he charged was quite small. He was always a very friendly fellow, in spite of his fatiguing 'duty.'

'I sha'n't need your services to-day,' I soon

remarked. 'Do not mention it, monsieur,' he said. 'It is a

pleasure to be at your disposition.' 'I wish to be alone for the present. I will send

for you if I need you.' He rose to go. 'Then I will return in half-an-

hour, monsieur.' He returned in half-an-hour and found that I was out. However, he had good information that I was only walking about the town, and his suspicions were lulled. I had no wish to be harassed by the presence of officials while crossing the lake. The commissary was a blot upon fine scenery. He would talk about Japan when you wanted to look at a mountain; he would eat unsavoury messes till a beautiful sunset would look bilious; he would stick to you like a leech so that Greeks and Bulgars were afraid to utter their thoughts for fear of being reported. An entertaining companion for half-anhour, he was intolerable for a couple of days.

'Monsieur, the boatmen are ready.'

It was Alexandre who spoke. He and Nikola had planned well. These Bulgars love a little conspiracy, and Alexandre had old scores to pay off against the Commissary of Police. He had chartered a tchun with the ostensible object of paddling round to another part of the town; and the sturdy crew, which could mean nothing less than a journey across the lake, had been kept well in the background. But at four in the afternoon all were assembled, and we went on board—Alexandre, Nikola, Nikola's fourteen-year-old brother, and myself. We pushed off straight from the steps of the house, and were soon splashing through the profound, many-coloured waters.

Of all rude, primeval, wave-ploughing vessels

these tolums are the rudest and the least altered by improvements in nautical science. For thousands of years they have plied on the Lake of Ochrida, and are the same now as they were in the days before Homer. The Dorian invaders of Greece may have lived round the lake and used these boats before they migrated and founded Sparta. The tolus is a hulk of roughly hewn planks, marrow and long, with a high prow rising up surk to a point, the bulwarks slanting down towards the stern and enclosing a deep, muddy well. Across the middle of the boat was extended a platform projecting over the water on each side, with a low wooden rail to prevent the passengers from rolling off. Here we stretched ourselves kisurely on rugs. Bunched up in the high prow of the boat, one above another, were three oarsmen, all plying their clumsy cars with enormous waste of energy on the stroke-side. In the stern sat the skipper, using another oar as a sort of rudder, which he lazily jerked into the water, counteracting the circular impulse given to the vessel, and shouting his commands to the crew.

Othrida is on a hilly promontory at the north of the lake. At the top of the hill stand the ruins of the ancient castle with its dismantled battlements, the old deserted Greek Church, and the sew Bulgarian Church; and a little below, the white sone of the Konak, where the Vali and a host of sin uniform carry on the game of governmai. From that point the town seems to tumble down the side of the hill into the lake, the houses of stone and wood clustering together in a mass of white, brown, and red, and at last bordering upon the public highway of the lake. Some of the somes are built on hills over the water, and the mabitants fare from place to place in tchuns, while the children spend the day in wading out or diving no the water. The town, as seen from the lake, as blaze of colour and animation; the profound alse of the water (purple when you look down into th edged by the white ripple of the waves against town; the bright dresses of aquatic men, women, ad children; the brown zigzag roofs of the houses, with the white minarets of the mosques and the Gen of acacia-trees rising against the hillside or the bot sky. How ridiculously peaceful and beautihi is seems when one recalls the political intrigues ad acchaireds which are concentrated here in the labitation of Turks, Bulgars, Greeks, and Vlachs, who hate one another with bitter hatred !

Yo town in Turkey is more wonderful than the control of the contro

are the haunts of the Bulgarian bands, the outlaws who wage perpetual war on the Turkish police and soldiers. On the west still higher mountains stretch away mysteriously into the land where the vigorous, lawless Albanians live, the sturdy folk who reduce Turkish authority to a shadow and wage inter-tribal wars from natural fastnesses.

The deep, guttural voice of our Bulgarian skipper recalls me to my immediate surroundings. His broad, passionless face has relaxed into a goodtempered smile; he is taking things very easily himself, but he eggs on his crew to exert themselves, taunting them with facetious remarks and gibing at their appearance. He has the air of a man who thinks he has earned repose, whose stockin-trade is an industrious past and some scanty savings, and an uncommon capacity for alternately bustling and soothing his subordinates. The latter make a harmonious trio, a queer union of opposites, as they plunge their oars into the water as if bent on fathoming the lake. High up in the bow sits a grisly, elderly Vlach, with a stubbly chin and knotted eyebrows, his forehead swathed in a wet band. His short, thick legs quiver under his exertions, his body moves as if by machinery, his face is as motionless as lead, and through all the journey I do not believe he once opened his mouth or changed his position.

Just below him was a youth of singular appearance and deportment. He spoke Bulgarian better than Greek, but there was no question as to his being by birth a pure-blooded Hellene. He would have been a model for Apollo. His well-proportioned limbs and body moved with ease and grace. His naturally fair face was darkened by exposure to the sun. His straight nose and shapely chin, well-curved brow and clear, active eyes, betokened a man of gentle breeding and fine temperament. Afterwards, when I talked to him, he was shy and reserved; there was a slight melancholy in his manner which redeemed his otherwise dull remarks. It was strange talking familiarly to a man who might have stepped down from the frieze of the Parthenon, and, all-unconscious of his betraying features, was not quite sure whether to call himself a Bulgar or a Greek. Even then, he only knew that he was a Greek because he had been induced to attend the right church and hear the Testament read in the original tongue.

To what race the third member of our crew belonged I know not, but I think there must have been a considerable strain of Servian blood in his composition. Such incessant vivacity and proneness to inordinate laughter are not often found in the pure Bulgarian. He would tug at his oar with terrific vigour, he would stop without a moment's warning and mop his face, all the time he was hurling jests at his fellows and venting himself in peals of laughter; and once, when the oarsmen were told to lie easy for a moment, he rose up and plunged into the lake, and reappeared at the edge of the boat as sleek as a seal.

'Whoa!' the skipper suddenly shouted, rising in his seat and pointing over the water.

'Whoa!' cried Alexandre and Nikola in chorus.
All eyes were turned forward, and I looked to
see what it was.

'Your revolver, monsieur,' cried Alexandre.

Some way off appeared a dark, mysterious object on the water, looking in the sunlight like a black gondola rising and falling with a gentle plunging movement. Animation and excitement were on the faces of the crew. With muffled oars we moved silently towards the strange object. I had my revolver ready, and wished it were a rifle. Nikola, too, had cocked his clumsy weapon; and then we perceived two, three, four of these strange vessels moving like a fleet towards us. But before we could get nearer there was a fluttering, rushing noise, and monstrous swan-like creatures, six times larger than any swan, rose into the air and flew off into an impenetrable distance.

There was disappointment among the crew. They had hoped-not knowing the limitations of a revolver-that we might bag one of the great fowl that frequent the lake. But already we were late, and the sun was beginning to disappear behind the steep range of mountains in the west, covering the sky with scarlet and reflected in many hues across the water. As we lay back on our platform, a cool breeze springing up off the land fanned our cheeks, and almost instantly the water, till now scarcely stirred, rose in waves which made our barque toss and roll like a cockle-shell. As the skipper shouted his 'Halloa' once again the men settled down more grimly to their work, and the heavy vessel splashed and crashed its way through the tumbling water.

Soon the southern end of the lake became more clearly visible, and as we neared it in the now dim light a shelving promontory appeared sloping down towards the water, and at its extremity, rising high above it, a massive structure of white stone and dark woodwork—the Monastery of Sveti Naoum. Then the deep, welcome tolling of a bell sounded out across the water. 'To announce the arrival of guests,' said Nikola.

A little cluster of people, dependants of the monastery, hauled our boat up the beach, shouldered our luggage, and conducted us up the slope to the gate in the rear of the building. They led us through the farm enclosure, under the great arch of the inner courtyard, past the chapel in the centre, and up a narrow staircase to the main hall of the monastery. There stood the abbot waiting to receive us, his stately figure clad in flowing garments, his tall priest's hat on his head, his white beard falling low over his chest, and behind him half-a-dozen retainers. He extended his hand, uttering words of welcome in Greek, and conducted us to the chamber reserved for honoured guests. There he made me sit on a lounge, placing my friends around me, and standing himself till the last person was seated. An attendant, entering

immediately, served us with coffee, cigarettes, and rakia (the fiery white liqueur which is to be found everywhere in the Balkans).

Then followed the ordinary courtesies between host and guest. Had I travelled far? Was I making a long stay? What did I think of their poor Macedonia? But here all was peace and rest, said the abbot. The mountain behind, the lake in front, kept them from the ravages of soldiers and brigands and beys. Yes, they too had lost lands; they were not so rich as they had been; still, they were well off compared with other Christian monasteries, and they did not complain. He spoke in a suave, gentle manner, smiling with benevolence, listening to every word, with the art of one whose business in life is to please. He told me of a small party of Greeks who had arrived, and were being entertained, along with my boatmen, in another apartment. At that moment the chief person of the party was introduced into my room, formally presented to me, and at once began to address me in French. Both of us having looked through the visitors' book, which contained entries in ancient and modern Greek, he at once entered into a discussion of the relation between the dead and the living languages. His countrymen were very proud of their great authors, he told me; he himself had read a little Homer, though it was very difficult because of its unusual forms. Æschylus? No, he had not heard of Æschylus; but there was one great tragedian-what was his name?-yes, Sophocleswhom he had often heard praised.

The abbot was delighted to see his two guests getting on so agreeably together, and for a time sat silent, with folded hands, beaming with smiles. Soon he asked Alexandre what was the subject of our conversation, and bade him inquire if I had read any of the New Testament in Greek. Thus we fell to comparing ancient forms of words with the new, and the abbot was much amused to hear how we in England pronounce such words as βασιλεύς, τόδωρ, &c.

At this moment an attendant entered.

'What would you like for dinner?' Alexandre interpreted.

'What may I have?' said I.

'Anything, anything,' was the munificent reply; and with so large a choice before me I was at a loss to know where to begin. I named one or two dishes which I had received on former occasions; but no, they were very sorry, those just happened to be the things'——

I appealed to Alexandre to settle the matter, and I soon saw that it had already been quite decided what was to be given me. Shortly after we were shown out into the corridor, a spacious hall whence doors led out into various apartments. When I had first arrived, the bare boards of the corridor had been relieved only by one or two couches against the wall, but now a table and chairs had been set in the middle, and servants stood ready with dishes of food and wine. I was placed at the head of the

table, with Nikola on my right hand and Alexandre on my left—Nikola's young brother had doubtless been sent away with the servants. The abbot would neither dine nor sit down—it was a fast-day with him—so he stood at the end of the table, with fiolded hands, encouraging us to eat, and speeding the servants when our glasses or our plates became empty.

This ample repast at an end, our host again led me to the guest-chamber, where the bed had been provided with pillows and a bright, clean quilt one of the few clean quilts which I had the good fortune to find in this country.

It was not past seven o'clock when I arose in the morning, but I found that the abbot and half his household had been in a condition of waiting for an hour or more.

'When will monsieur see round the monastery?' the abbot inquired.

I was ready at once, and he took us down to the courtyard.

Much of the monastery is of great age. It is approached from the landward side, on the south, whence, on entering by the gate, the visitor finds himself in a courtyard surrounded on all sides by a rectangular building with wooden balconies projecting from the first story. In the middle of the court, and entirely separated from the other buildings, stands the chapel, a Byzantine structure belonging, so far as I could gather, to the fourth or fifth century A.D. The abbot leads me into the little shrine which is the main body of the church. Around the altar is a multitude of candles. The light shines dimly through the stained windows, falling on the many-coloured frescoes which cover every space on the walls, and depict apostles and saints and strange allegories of heaven and hell. But the paint, varnished as it has been again and again, has become dark with time, so that many of the pictures are mere splodges of colour. The small west end is a later addition, bright with frescoes of a clearer but cruder hue, and leading out of this on one side is the tiny side-chapel, wherein lie the bones of the patron-saint. A box set on the tomb is the repository for offerings, and my contribution

to it is the only payment which custom allows me as a visitor to make for my entertainment.

From the chapel I was taken to the enormous kitchen, where monstrous fires are always alight heating monstrous ovens. I was formally introduced to the head-cook, an important person, who in turn introduced me to several subordinate cooks. I was taken into the cool storeroom, where rows upon rows of cheeses and sides of bacon created strange odours; thence to a lofty parapet, where I found myself suddenly in the open air, gazing sheer down the side of the monastery into the depth of the lake and across to the distant haze of the Albanian mountains. Through open chambers and balconies my host conducted me, telling me that here, at festival seasons, hundreds and even thousands of people from all the country-side would seek the entertainment of the monastery, sleeping in blankets at night, dancing in the courtyard by day.

Being told of a good place where I could bathe in the lake, Alexandre and I repaired thither. As we returned we were met by the abbot, at the head of a score or so of his servants. In a moment men caught hold of our luggage and carried it down to the boat, where Nikola and the others were awaiting us. With a kindly pressure of the hand, the old Greek urged that I must come again, and test for a longer time the resources of Sveti Naoum. As we pushed off into the water he waved his handkerchief again and again, and I waved in return. Every inhabitant of the monastery and its buildings was with him, standing on the shore shouting adieux. Long after we were out of earshot they stood watching us; but when we were about to settle down to our journey we heard the report of a gun, and then a second, and a third. Three times in response we let off our only firearm, my revolver; and as the echo died away we could hear nothing but the plash-plash of the oars, till the white and black of the monastery loomed dim in the distance, and the lake had become a boundless expanse, and the sun poured down on us with its merciless midday heat. Again for hours we lumbered along over the glistening water.

THE WORLD'S GREATEST LIBRARY.

By WILLIAM SIDEBOTHAM.

Thas been said that the Seven Wonders of the World are the Pyramids of Egypt, the Hanging Gardens of Babylon, the tomb of Mausolus, the Temple of Diana at Ephesus, the Colossus of Diana at Ephesus, the

Colossus of Rhodes, the statue of Alexandria. This dictum at the time it was made was undoubtedly true; but during the last hundred and fity years, on the spot formerly occupied by the famous Montague House in Bloomsbury, London,

there have gradually been gathered together antiquarian, literary, and scientific collections which, although they do not possess the massive grandeur of the Pyramids or the exquisite beauty of design shown in some of the triumphs of past ages, are still as wonderful as any of these, illustrating as they do the history of the world from its very infancy. The building which contains these collections is the British Museum; and it is somewhat remarkable that a structure erected to accommodate collections showing the gradual growth of civilisation should stand on the grounds where in 1780 were encamped the troops which were to quell the Gordon riots, one of the centres of which was in Bloomsbury.

In this great building can be seen sculptures illustrating the history of Egypt from the time of the early Pharaohs-4000 B.C.-an immense number of household articles, jewellery, vases, tablets of the dead, tools, &c., typifying the oppression of the Children of Israel under Rameses II., right through the captivity, together with the coffins of ancient priestesses, with inscriptions of prayers to the protecting gods, and the embalmed remains of the leading members of the numerous dynasties. Here, too, can be seen antiquities of Babylonia, Assyria, and ancient Greece and Rome recovered from the tombs, many of them in a most extraordinary state of preservation despite the fact that they carry us back to the time of Abraham; and, last but not least, there are fifty thousand volumes of manuscripts, including Latin and Greek papyri, found in the tombs of the ancient kings, containing the handwriting and seals of thousands of years; while close by the report of the latest speech delivered by one of our leading statesmen may be read!

On the death of Sir Hans Sloane, the great physician and scientist, it was found that by his will his executors were empowered to offer to Parliament his fine library and the whole of his vast collection of antiquities and works of art for twenty thousand pounds-thirty thousand pounds less than it had cost him. The offer was accepted, and an Act was passed in 1753 for 'the purchase of the museum or collection of Sir Hans Sloane, Bart., and of the Harleian collection of manuscripts, and procuring one general repository for the better reception and more convenient use of the said collection and of the Cottonian Library and additions thereto.' The money was raised by means of a public lottery, the amount being three hundred thousand This sum also included the cost of pounds. Montague House. There were one hundred thousand tickets issued of three pounds each. It was hoped that the funds thus obtained would be sufficient not only to meet the cost of extensions and repairs, but also to provide for the salaries of the officials. The collections, however, grew with such marvellous rapidity that eventually additional land had to be obtained close to the Museum at a cost of two hundred thousand pounds, and a separate museum for the natural history collection had to be erected at South Kensington.

When George IV. gave what is known as the King's Library to the nation—a library which cost one hundred and thirty thousand pounds, and which contains some of the greatest rarities in literature—it was decided to alter the whole character of the building. A separate library was erected to accommodate the sixty-three thousand volumes given by His Majesty; and in 1849 it was found necessary to erect the present magnificent reading-room. This reading-room contains one million two hundred and fifty thousand cubic feet of space; and at the

time it was erected the surrounding libraries had an additional seven hundred and fifty thousand cubic feet. The building is constructed mainly of iron, with brick arches between the main ribs.

The library, which now contains between three million and four million volumes, is without exception the largest in the world, the only one which approaches it in size being the Bibliothèque Nationale, Paris; and it is interesting to note that for the accommodation of this immense number of books upwards of forty-three miles of shelves are required!

For beauty of design, elegance of construction, and symmetry of form, there is no building in London which will bear comparison with the reading-room at the British Museum. In the centre is a platform, slightly raised, occupied by the superintendent and his assistants. Round this platform, a few feet apart, are two rows of desks arranged in the form of a circle. The desks-the outer one has a circumference of nearly two hundred feetare filled with large catalogues, and radiating from the desks like the spokes of a great wheel are the long tables provided for the readers. ingenious method, the tables are divided in the centre by a sort of partition which prevents students from being disturbed by the readers on the other side. On the top of the partition a number of electric incandescent lamps are fixed at intervals, and just underneath these are shelves and bookrests, which, when not in use, fit flush with the partition. Each seat along the tables has a letter and number, and the reader (who is provided with pen, ink, blotting-paper, and a chair), on filling up the form when making application for a book, notifies the place where he is sitting, and the book is in due course brought to him by an attendant.

The whole of the wall-space right round the room to the bottom of the dome is filled with the lore of many centuries. Within the reach of the readers on the ground-floor there are twenty thousand works of reference, classified in their various subjects, and in regard to these no application to the superintendent is necessary; while in the two galleries above there are fifty thousand additional volumes. The dome has a singularly dignified appearance. At the bottom there is a massive cornice, and the inner surface of the dome is divided into two compartments, and these again are subdivided by beautiful ornamental panels. The light is admitted through large windows which rise perpendicularly from the cornice, and by this arrangement ample opportunity is afforded, owing to the curvature of the dome, for a magnificent scheme of decoration.

The interior of the reading-room is one of the sights of London. Here forgather great historians, prominent politicians, and savants—men whose works have obtained a world-wide popularity. Among the 'readers' in the past have been Guizot, Thiers, Louis Napoleon, Louis-Philippe, Cavour, Garibaldi, Macaulay, Blackstone, Dr Johnson, the

fuher of Disraeli, David Hume, the poet Gray, Carlyle, Thackeray, Dickena, Lytton, Huxley; and, coming to later times, Gladstone, Lecky, Gardiner, Wolseley, Goschen, Dilke, Morley, Lubbock (now Lord Avebury), and a host of others. From middry up to about five P.M., which is the busiest time of the day, the room is generally well filled; and as there is accommodation for upwards of four hundred and fifty persons, the scene is a very animated one. So many applications are made for books during the afternoon that boys are specially 'told of' to bring the volumes on barrows, which in appearance resemble those used by porters for luggage at railway stations.

In order to obtain a book the reader has to fill up a form giving the name of the author and title of the work, the press-mark (indicating the locality where the volume is to be found), and the date and place of publication. These particulars are obtained from the huge catalogues, and the reader is responsible for all the books that he borrows so long as the form he has filled up and handed in to the attendants remains uncancelled. There is no limit as to the number of books a reader may borrow; but in order to facilitate the work it is usual to fill up a fresh form for every volume he wishes to obtain. Special rooms are set apart for those wishing to see rare books or priceless manuscripts.

By the courtesy of Mr G. K. Fortescue, who is the head of the important department of printed books, I was recently granted the privilege of inspecting the series of galleries behind the readingroom, where the major portion of the vast collection is kept. And what a perfect maze it is! The rading room, as before stated, is in the centre of a large quadrangle, and in the four corners of the parallelogram unoccupied by the circle of the room a remarkable and ingenious series of galleries is built, affording accommodation for millions of books. To avoid risk of fire, these galleries have skylights, so artificial illumination being allowed. They resemble huge cages, for the floors are of open ironwork, which admit the light through the several socies. The only drawback to this arrangement drawback which cannot be avoided—is that during the fogs which are so prevalent in London during the winter months no books from these selleries can be obtained. Despite the extensive accommodation which was provided, owing to the Copyright Act—under which a copy of every book and paper published in the United Kingdom has to be sent to the British Museum—the number of volumes increased to such gigantic proportions that a special contrivance had to be resorted to in order to provide room for them. This takes the form of alding Presses, consisting of a framework fitted with shelves open back and front so as to receive rolumes on each side. These shelves are suspended on girders, and, running smoothly on wheels, can be easily moved backwards and forwards. They supplement the standard presses, and by this means the books in many places are six deep! All these presses are made of iron plates, the shelves being covered with leather.

Many of the choicest books which the library contains were bequeathed to the nation by private donors; others have from time to time been purchased by the trustees out of the grants made annually to the British Museum by Parliament. It is impossible to form an accurate estimate as to the value of some of the choicest books, for many in the library are the only known copies; but several have previously been sold at prices approaching five thousand pounds each. Probably the gem of the collection is the Mazarin Bible, which was printed in Latin at Mentz about the year 1455. This is the earliest complete printed book known. The Dictes or Sayings of the Philosophers, which was translated from the French by Anthony Wyderville, Earl Rivers, and printed by William Caxton at Westminster in 1477, is the first volume known with certainty to have been printed in England. Other specimens of the earliest productions of the printing-press in England include The Game and Playe of the Chesse, The Book of Tales of Cauntyrburye, and the English version of Æsop's Fables. Among the numerous old copies of the Scriptures and religious works are Martin Luther's translation of the Bible, and Myles Coverdale's Bible, dated 1530; the New Testament which belonged to Anne Boleyn; The Assertion of the Seven Sacraments, the book which procured for Henry VIII. from Pope Leo X. the title of 'Defender of the Faith,' ever since borne by the British sovereigns; the Lives of the Archbishops of Canterbury, which was presented to Queen Elizabeth by its author, Archbishop Parker; the Codex Alexandrinus, an ancient Greek copy of the Scriptures supposed to have been executed by Thecla, a lady of Alexandria, in the fourth or fifth century, and presented by Cyril Lucar, the Patriarch of Constantinople, to Charles I. The last-named is one of the two most ancient copies of the Scriptures in existence.

The manuscripts in the British Museum form the finest collection in the world. Among the most interesting are 'the Recognitions' of Clement of Rome in Syriac, dated about 411; the English version of Wycliffe's Bible, written towards the close of the fourteenth century; the orations of Hyperides, Homer, Aristotle, &c., and the 'Bull of Pope Innocent III., whereby he receives in fee the Kingdom of England, given to the Roman Church by virtue of a charter confirmed by the Golden Seal of King John, and takes it into his Apostolic protection: Given at St Peter's, 11 Kalends of May Ad. 1214, and of the Pontificate of Pope Innocent the seventeenth year.'

It would be impossible, owing to exigencies of space, to mention even a small proportion of the historical deeds which are to be seen in the library; suffice it to say that they include an ancient copy of the famous Magna Charta—the original copy is no longer in existence—granted by King John, and the charter granted by William the

Conqueror for the foundation of Battle Abbey in Sussex after the battle of Hastings in 1066.

Reference has already been made to the Copyright Act of 1842, under which the Museum is entitled to a gratuitous copy of every printed book, newspaper, or document published in the United Kingdom; and it is this provision which has contributed largely to the tremendous growth of the library-a growth which has for a considerable time occupied the serious attention of the trustees, for it soon became apparent that unless further accommodation could be provided, especially for the newspapers, all the available space would be filled. We have seen the ingenious method of hanging-presses, by which a vast collection of additional books can be stored; and, as showing the stupendous growth in the number of volumes, it may be pointed out that in 1753 the library started with about fifty thousand books; in 1821 the number had only reached one hundred and sixteen thousand; in 1838 it was two hundred and thirty-five thousand; twenty years later it had reached five hundred and fifty thousand; while in 1896 there were one million seven hundred and fifty thousand volumes, not counting a single sheet or parts of works accumulating. Since then the growth has been much more rapid, and it is estimated that there are now about three million five hundred thousand volumes in the library. The work of arranging this collection is a stupendous undertaking; for each book has to be classified, and the press-mark indicating its locality has to be affixed on the back. According to the latest parliamentary return the total number of these press-marks during 1905 amounted to seventy-four thousand eight hundred and seventy-five; in addition to which thirty-seven thousand four hundred and four press-marks have been altered in consequence of changes and rearrangements, nearly thirty-one thousand labels have been fixed to books and volumes of newspapers, and one hundred and fifteen thousand four hundred and ninety-seven obliterated labels have been renewed. There is a corresponding amount of work to be done in cataloguing. A large staff is engaged in the binding and repairing of books at the Museum. The number of volumes and sets of pamphlets sent to be bound in the course of last year was eleven thousand nine hundred and eightyfive, including three thousand three hundred and twenty-eight volumes of newspapers; while over twenty-five thousand books have been repaired.

The number of newspapers published in the United Kingdom received under the provisions of the Copyright Act during the year was three thousand two hundred and sixty-one, comprising two hundred and twenty-one thousand two hundred and sixty-nine single numbers; in addition to which large numbers of colonial and foreign newspapers, together with broadsides, parliamentary papers, &c., have either been presented or purchased.

With regard to the newspapers, it was calculated in 1882 that the space available at the Museum would

be sufficient for thirty-three years; but since that time there has been such an enormous accumulation that the authorities have tried several means to cope with the pressure. Some time ago additional storage-room was provided in the basement and the new buildings; but this has practically been filled. The British newspapers in 1837 only occupied about forty presses, whereas now there are two and a quarter miles of presses; besides which accommodation has had to be provided for the colonial, American, and foreign newspapers. Some time ago land was obtained at Hendon, where a repository for storage of newspapers and other printed matter is now in course of construction; and it is believed that the extra accommodation which will thus be provided will be sufficient to meet the demands for a very considerable period.

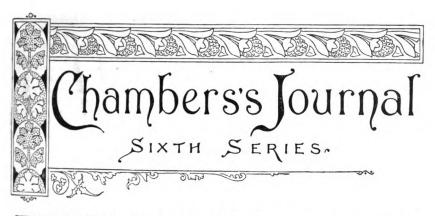

The cost of the construction of the reading-room and the surrounding galleries was one hundred and fifty thousand pounds; and the expenditure on purchases alone for the Museum up to 1875 was considerably over one million pounds. The Government has been very liberal in making large annual grants, sometimes amounting to upwards of one hundred thousand pounds, in order that the collections should be of the most representative character; and it was owing to the generosity of the late Sir William Harcourt, when Chancellor of the Exchequer in 1896, that the additional freehold land, on which sixty-eight houses stood, was secured at a cost of two hundred thousand pounds to meet the growing needs of the Museum. These houses are gradually being demolished, and when the whole of them have disappeared the authorities will possess a square plot of thirteen acres completely isolated by the surrounding roadways.

It is considered that this land will be sufficient to meet the requirements of the trustees for another century, but no one can prophesy with accuracy as to the growth of the Museum even in the immediate future. In the past all such predictions have been completely falsified; but, in the words of Macaulay, the Museum will remain the repository of such various and precious treasures of art, science, and learning as were scarce ever assembled under a single roof.

TO ONE WHO WENT AWAY.

O THOU whose feet no longer tread this street
Wherein I pass to-day, whose weary eyes
Gaze up no longer at these narrowed skies,
'Neath winter's bitter cold or summer's heat!
I would not have thee back again to meet
The wrong which drowned thy life in miseries,
'Reft thee of all for which our poor heart sighs,
And left thee naught but thy soul pure and sweet.
Thine eyes look now o'er all God's universe,
The meaning of life's pain is known at last;
And I, who stand here waiting, feel the curse
Of pain slip from me now thy pain is past.
I look up smiling. Thou hast borne the worse.
Safe in His tender hand God holds thee fast!

KATE MELLERSH.

THIRTY-THREE YEARS' HARD LABOUR AT WESTMINSTER.

By HENRY W. LUCY.

PART I.

HIRTY-THREE years ago, when I took my seat in the Press Gallery of the House of Commons as director of the staff of a great morning newspaper, Mr Gladstone was Prime

Minister, Mr Lowe Chancellor of the Etchequer, Mr Bruce (afterwards Lord Aberdare) Home Secretary, Earl Granville Foreign Secretary, Lord Kimberley Colonial Secretary, Mr Cardwell War Minister, the Duke of Argyll Secretary of State for India, Mr Childers First Lord of the Admiralty, Sir Robert Collier Attorney-General, Sir John Coleridge Solicitor-General, Lord Dufferin Chancellor of the Duchy. All, all are gone, the old familiar faces. Of the members of the First Gladstone Administration still with us are Lord Lansdowne, who, commencing official life as Junior Lord of the Treasury in a Liberal Administration, lived to succeed Lord Salisbury at the Foreign Office and to lead the majority in the House of Lords; the Duke of Devonshire, who, as Lord Hartington, was Chief Secretary for Ireland; Mr Goschen, a Liberal President of the Poor Law Bard, who within a score of years bloomed into the fullness of a Unionist Chancellor of the Exchequer; and Mr Arthur Peel, who proved one of the best Speakers the House of Commons has known, and to-

day lives in honoured retirement as Viscount Peel. Gladstone was in his sixty-fourth year, but as at as mental and physical activity were concerned in the very prime of life. Two years later, smitten at the poll with heavy hand, he suddenly convinced himself that he was advanced in years and had sarned the guerdon of rest. 'At sixty-five,' he wrote to 'my dear Granville' immediately after the rout of the Liberals at the General Election of 1874, after forty-two years of a laborious public life, I think myself entitled to retire on the first opportunity; Gladstone had in remarkable measure the comforting gift of convincing himself of the scenacy of any view of current events he might

take at a particular moment. If they diametrically differed from others expressed at earlier epochs, what matter? He was dealing with to-day, not the day before yesterday. When he uttered this wail for rest he really meant he had done with political affairs and might now devote himself to the affairs of the Vatican, varied by more leisurely study of Homer.

Soon he discovered his mistake. His manner of rectifying it was a little bit of comedy delightful to watch. Through the opening session of the Disraelian Parliament he studiously absented himself, leaving the conduct of the business of the Opposition in commission. Shortly after Lord Hartington accepted the thankless post of Leader, he began furtively to reappear on the familiar scene. As the session lengthened the old passion awakened in his breast. With increasing force he felt himself drawn back into the vortex of parliamentary life. That, however, would never do. Had he not publicly announced his retirement, and was not his seat opposite the brass-bound box filled by another? The temptation was irresistible, and he felt himself yielding to it. This he did with characteristic subtlety. When he looked in on debate he assumed a casual air unconsciously founded upon remote study of Paul Pry, indicating hope that he did not intrude. Also like Paul Pry, he went the length of carrying an umbrella under his arm when he emerged from behind the Speaker's chair, an incident unparalleled in the career of an ex-Minister. Its meaning was clear to the seeing eye. When he left home nothing was farther from his thoughts than resumption of attendance on sittings of the House of Commons. As he strolled down Parliament Street, meaning to take the air of the silver Thames as it swept by the Embankment, his eye fell upon the lofty structure of the Houses of Parliament.

'Hallo!' said Mr Wemmick, taking a morning walk with Miss Skiffins on his arm, 'here's a church. Let's go in and get married.'

Readers of Great Expectations will remember how JANUARY 12, 1907. [All Rights Reserved.]

the great strategy of Mr Wemmick's life was an attitude of unpreparedness for ordered events, an air of surprise at the development of a deliberately arranged sequence. That, of course, was not Gladstone's mental habitude; but we can imagine him on this particular occasion saying to himself, 'Hallo! here's the House of Commons. Let's go in and see what they are doing.' Entering, he kept up appearances by sitting at the remote end of the bench, the humble place of ex-Under-Secretaries. In further evidence of the casualness of his call, he put on his hat when he sat down, crossed gloved hands over the handle of his umbrella, and looked round the House with the glow of pleased interest seen on the faces of strangers in the Gallery making their first acquaintance with the historic scene.

Of course this did not last long. The glamour of the House of Commons reasserted its power over the man who in youth and manhood splendidly added to it. The cry of hapless Bulgaria, trampled on by the Turk, acted as a trumpet-call upon the veteran who had laboriously convinced himself that his helmet was now a hive for bees. When he came down to the House of Commons the umbrella, which added a touch of farce to the situation by slightly gampish appearance, was left in the stand. His head was bared. He literally took off his gloves and 'went for' a Government that looked on unconcerned at the massacres at Sofia, a Premier who characterised narrative of the atrocities as 'coffee-house babble,'

The House of Commons not being large enough or sufficiently crowded for the work he had in hand, he supplemented effort there by transferring the scene of battle to Midlothian. It chanced that, these historic campaigns taking place in the parliamentary recess, I had the opportunity of accompanying him throughout the series ending in a victory that toppled over an apparently impregnable Ministry. Wonderful in the House of Commons, he was marvellous in Midlothian. Four years had been added to the span of his life since he almost whimpered his cry for rest in the ear of Lord Granville. Again on the war-path, he fought with an energy that occasionally approached the confines of ferocity. The answering wave of popular enthusiasm rising in Midlothian whelmed the country, sweeping away the astonished Conservatives, apparently establishing the Liberals in power for at least a generation. How that appearance proved misleading, and what part Gladstone played in the debacle of 1886, is, as Rudyard Kipling used to say, another story.

Never in public life in either hemisphere were there confronted two men more diametrically opposed in manner and mode of thought than Disraeli and Gladstone. They had only one thing in common—genius. To each the other was an interesting, inexplicable puzzle. Here again there was difference in their method of contemplation. Gladstone, with his untamable energy, his rich verbosity, his susceptibility to religious and moral influences, rather amused Dizzy. When in fine

frenzy rolling, whether championing the rights of nationalities or the privilege of minorities, Dizzy, seated on the other side of the table, regarded him through his eyeglass with the air of one studying some strange animal recently imported. Gladstone was much more definite in his views about Disraeli. He rarely spoke or wrote of him in private relations. When he did there was only futile attempt to disguise his conviction that Dizzy was sorely lacking in principle.

When I first saw Disraeli in the House of Commons he was seated on the Front Opposition Bench, silent, sphinx-like. He was in disgrace at the time with his own party, having disappointed their hopes by declining office when proffered him by the Queen after Gladstone's defeat in 1873 on the Irish University Bill. His prescience was abundantly justified when, a few months later, a General Election gave him a majority that for the first time in an already long career placed him in power as well as in office. It was after that epoch that the Disraeli known to the last generation, the statesman who will live in history among British Prime Ministers, came to birth. Hitherto, through a turbulent life, he had a dual battle to fight. There were his political adversaries in the Liberal camp; his worst, most dangerous, foes were those of his own household. For more than thirty years he had been suspect, an undesirable alien among the Tory party, to which he, after due consideration, finally decided to attach himself. His supreme gifts made him indispensable to them. None the less they distrusted and disliked him.

Even after he came into his own, Prime Minister and Leader of a party he, as he boasted, had educated, there was evidence in the House of Commons of the old, deeply rooted feeling. It was manifested by two typical Tories, George Bentinck (known as 'Big Ben' to distinguish him from Cavendish Bentinck, a kinsman of lesser stature) and Beresford Hope, uncle of the then unknown Arthur James Balfour. Hope was founder of the Saturday Review, proprietor through its palmy days, which were chiefly devoted to attacking Dizzy. To hail him as 'that glorious Jew' in rhymed description of a ministerial dinnerparty given by him on his accession to the office of Chancellor of the Exchequer was, by reason of the adjective, complimentary as compared with what readers of the Saturday were taught to expect. Dizzy retorted by reference to Beresford Hope's 'Batavian grace.' This perfect Disraelian phrase can be fully enjoyed only by those who had personal knowledge of Beresford Hope. Of Dutch descent, he preserved the somewhat ungainly stumpiness of figure common to his forebears. His manner of addressing the House was thoughtfully elaborate, his phrases being drawn out in fashion suggestive of the finally successful operation of a corkscrew upon a stubborn cork.

Dizzy grew almost mellow in the sunshine of late, unexpected prosperity. Not comparable with Gladstone as a debater, certainly not as an orator, he was infinitely his superior as Leader of the House of Commons. Gladstone walked about lobby and corridor with his head in the clouds, not seeing as his way faithful followers whose loyalty would have been strengthened by a nod, a smile, or a friendly word. He did not mean to be offensive. In this habit he was so in more than one well-known instance, greatly to the detriment of his cause and his Government. In social life the most courteous of men, when actually engaged in the service of the State he had no time or thought for small personal matters. Disraeli had, and greatly profited by their culture.

Lord Rowton, long time his private secretary,

told me his chief utilised what otherwise might have been wasted moments in the Division Lobby by soldering any little cracks apparent in the Ministerial ones. If the Whips notified to him sign of revolt in a particular quarter, the Premier, watching the throng pass through the Division Lobby, would nod recognition to the discontented member, engage him in conversation whilst the Lobby emptied, and, if the case were at all threatening, link arms and lead him on to the wicket where the tellers stand. 'I Dever, said Lord Rowton, knew of a brooding autiny come to a head after the Chief had walked out of the Lobby arm-in-arm with the leading spirit. Nor did Disraeli limit his blandishments to his own party. I have personal knowledge of two captures made from the enemy's camp. One was Joseph Cowen, a man of letters, one of the few autral orators heard at Westminster in modern umes. A Radical of extreme type, whose sympathies reat out to struggling nationalities wherever they were in revolt against tyranny, Cowen naturally ranged himself on the side of Gladstone when, in is the Liberal Premier asked for renewal of office. As a youth he had met the great statesman at the house of his father during the campaign of 1888. His newspaper, one of the most influential m the north of England, helped to keep Northumberhand faithful to the Liberal flag when all around dioriresses were falling. Returned in 1874 to repreen; his native town, remembering former acquaintthe with his father's guest, Cowen, on entering the House, naturally expected some recognition from is reacrated Leader. Gladstone, coming upon him in the Lobby, passed him without a sign. It was a mail event, but recollection of it rankled. Dizzy Layor may not have heard of it. He certainly was t pains to make the acquaintance of the member is Newcastle, and succeeded in turning what might are been a faithful follower of the Liberal Leader it in exceedingly embarrassing adversary.

The other true story shows Dizzy in his seriocair mood. In the Parliament of 1874-80 there
ra 1 pompous, preposterous little Irish member
town as Dr O'Leary. When the Premier was
cadeting through the House the Imperial Titles
axing through the House the Imperial Titles
axing through the House the Imperial Saling
through transformed his Queen into Empress, he
said every serve to add extraneous votes to the
satel Ministerial majority. The Irish members
tre, in accordance with traditional habit, 'ag'in'

the Ministry.' But the question was not one that directly affected Ireland. By taking thought, he might seduce one or two into the Ministerial Lobby. His eye falling on Dr O'Leary, he with quick intuition saw his chance. On the critical eve of the second reading of the Bill he came upon the Doctor strolling down the corridor on his way to the Tea-Room. Overtaking him, he laid a hand on his shoulder with friendly pressure and exclaimed, 'My dear Doctor, how you remind me of my old friend Tom Moore! As I walked behind you just now the resemblance was startling.' That won the trick. The member for Drogheda voted for the Government on the Royal Titles Bill.

John Bright had temporarily retired from parliamentary life when I entered upon it. He came back in 1874. But he was never more the man whose oratory charmed and convinced the House during the prolonged struggle round the standard of parliamentary reform. He did not through the first session of the Disraelian Parliament break the silence of many years. He was content to sit at the lower end of the bench in companionship with Gladstone on his fitful appearances. His interposition in parliamentary affairs on coming back to the old scene was characteristic. Kenealy, returned as member for Stoke-on-Trent on the crest of the strange wave of public enthusiasm which lifted high the champion of the Claimant to the Tichborne estates, presented himself to take the oath and his seat. In accordance with the Standing Orders, it is necessary for a member coming up after a by-election to be introduced by two others. Whalley, the eccentric member for Peterborough, was ready with his services. But no other would associate himself with the advocate of Arthur Orton, the slanderer of his Judges. Help came from an unexpected quarter. John Bright, rising from the Front Opposition Bench, said that out of deference to the will of the large constituency who had elected Kenealy he would himself, if the hon. member accepted his companionship, be glad to walk with him to the table. So, between the great Tribune and the half-crazy member for Peterborough, Kenealy, hat in one hand, a stout umbrella in the other, walked up to the table and took the oath.

Among several fables to which in the wantonness of youth I gave birth was one which appeared at the time in a parliamentary sketch that had wide vogue in the World, then recently founded by Edmund Yates, to the effect that whilst Kenealy took the oath he hung his umbrella by its generous crook on the neck of the Mace. The story became part of accepted parliamentary history. The prosaic fact is that, when he reached forth his hand to take the form of oath handed him by the clerk, Kenealy leaned his gingham against the table on which the Mace reposed. I excuse myself with the reflection that it is not every flight of fancy that has even that substratum of fact.

It was noticed that when Bright unexpectedly

interposed in the Kenealy affair he was as confused as a young member making his maiden speech. He, the great master of phraseology, halted and stumbled among the words that forced themselves through his lips. For a moment there seemed danger of his utterly breaking down. He never quite got over this kind of paralysis through the remainder of his parliamentary second life. On a night in June, in the session of 1877, I observed him seated on the Front Opposition Bench hour after hour. The subject was a proposal to abolish capital punishment. He evidently intended to speak, and of course might have chosen his own time. He missed chance after chance, deferring his rising till after midnight, when the debate was about to collapse. Chancing to meet him at dinner the next night, I made some remark about his delayed interposition. He told me that there had come back upon him the species of stage fright that possesses all new members on first addressing the House.

Even Mr Gladstone was in his time subject to this influence. This would be incredible to observers of his later manner were it not affirmed by his own testimony. In his diary of his second session he records how, preparatory to making a speech, he silently 'offered earnest prayer for Divine assistance.' Returning after long absence imposed by broken health, Bright frequently, as in this debate on the abolition of capital punishment, came down prepared to take part in the discussion. When a favourable moment arrived, the Speaker turning a friendly eye upon him and pausing a moment in expectation of his rising, he was possessed by a shiver of apprehension. While he hesitated the chance passed. Once on his feet facing the familiar scene, cheered by welcoming voices, trepidation vanished. He was as calm, apparently as strong, as of yore, equally selfpossessed, and commanding his audience.

Another parliamentary star whose lustre was dimmed when I came under its influence was Robert Lowe. Like Bright, he reached his fullest height in the storm and stress of Reform Bill debate. But there was for some years sufficient left to make him an intellectual delight. He had more than one physical shortcoming that would have barred the pathway of success to a man of less supreme capacity. He had a harsh voice,

faulty enunciation, eyesight so dimmed that when consulting his notes he had to hold them so close to his face as to obscure them. His speech sparkled with wit, the flashes being sometimes dimmed by the shamefaced hurry with which they were produced. Across the waste of thirty-two years I recall one example of Lowe's ready wit. The House was discussing an Endowed Schools Bill. Lord Sandon, joining in the controversy, delivered a bitter speech aimed at the Endowed Schools Commissioner. Before sitting down, it occurring to him that he might have gone too far in assault on constituted authority, he remarked that he had 'carefully fenced himself' against being understood to pass unfriendly criticism upon the commissioner. Lowe, following, quoted the remark with the commentary, 'There has been in the noble lord's speech much more of railing than of fencing.'

Lowe's last appearance on the parliamentary stage was one of the most tragic episodes played upon it. In the spring of 1879 the Liberal Opposition in both Houses plucked up courage to move a vote of censure on the Government. On the third day of the debate Lowe interposed, and the House filled in anticipation of an intellectual treat. For twenty minutes he spoke with his usual felicity, his accustomed command over his audience. Citation of extracts from the Blue Books at this stage becoming necessary to his argument, he took up a bundle of notes placed on the brass-bound box at the opening of his speech. Sheet after sheet of the manuscript was held within an inch of his eyebrows. None was the one he wanted. Failing to find the quotation, he lamely attempted to quote its substance. A few minutes later reference to his notes again became necessary. Amid sympathetic cheers from both sides he nervously searched among the hopeless conglomeration. He could not find the note he sought, and after a painful pause abruptly resumed his seat. He never again spoke in a chamber still filled with the echo of many brilliant triumphs. In the following year, the Liberals coming into office, he meekly sought sanctuary in the House of Lords, where, till death finally sealed his lips, he sat mute, disguised as Lord Sherbrooke.

(To be concluded.)

THE LORD OF THE MANOR.

CHAPTER VIII.

HE lines about the corner of Craggs's mouth relaxed for a moment. Angela would have felt less dignified if she had only known how completely and thoroughly the old man read her.

'The gift of humour is one of God's good things,' Craggs remarked sententiously.
'It came to me somewhere about the first time I

had a few words with my old missis. Perhaps that's why we lived so happily together. It is a funny thing that old Craggs should be fighting the squire and getting the best of him. It's a queer thing that indirectly I am making the squire's fortune in spite of himself. But we need not go into that. If I can see the hospital on a proper footing that's all I care for.'

Angels turned and walked in the direction of the gate. She was filled with a strong idea that Craggs had had all the best of the argument. And it would have been a dreadful thing for all those poor people to go to the workhouse. The exodus would have been reflected on the Castleraynes. Angela looked thoughtfully at the picturesque building, with its brown-and-golden face, the lattice windows, and the fruit-trees in the garden beyond. There was quite a picturesque flavour about the hospital -it had been a feature of the landscape to point out to visitors with some pride. Here in this fair haven of rest the doyens of the clan lived out the evening of their lives, secure in the bounty of a powerful chief. Thus Angela had always regarded it. Craggs had been pleased to put a different isce on it altogether, and Cragge's speech had not leen couched in the language of diplomacy. In the highly coloured metaphor of the day, he had rabbed it in.

'And every word of it true,' May declared as the gris went down the winding path together. 'It would be a shameful thing if anything happened to these people. Well, I won't pursue the subject any further. Let us go home and have some tea-that is providing the grocer has sent it. He intimated in a letter to-day that he must decline further credit unless he has a cheque on account. Oh, how sch and tired I am of it all! I should be far happier behind the counter of a shop !'

Tea was ready laid in the dim, oak-panelled hall where the family portraits hung. Perhaps the andid soul of the grocer had relaxed, for the tea we there fresh and strong, and Aunt Gertrude at by the side of the table. No message had come ion York, though by this time doubtless the court had risen. The cosy meal was despatched, the daylight began to fade, and the lamps appeared, and yet no message from York. It was a little before dinner-time when the head of the house returned.

"We quite expected a telegram from you, father," ingels said reproachfully.

dare say it would have been better,' Mr Carderayne admitted candidly. 'Fact is, I went with Brownlow to see some horses that he had been oring and forgot all about it. A pair of dark ars, Angela, dirt cheap at four hundred guineas.

Varseyes twinkled. All this was so like her father. Angela flushed angrily. It was very unfortime; but she lacked the saving grace which had found in the early days of his married the she laid her hand on Mr Castlerayne's shalder; the pressure of her fingers was warmer than was absolutely necessary.

We have spent a miserably anxious day,' she ail I have been most restless and unhappy. and all ron can talk about is Mr Brownlow's new horses! How did the case go on ?'

Bless me, there is the dinner-bell!' Mr Castlehrae exclaimed, and I am not dressed yet. I'll you all about it after the servants have put the duar on the table. Tell Williams that I shall

want a bottle of the claret—the claret, mind. And let him be more careful'-

The rest of the speech was lost in the gloom of the corridor.

The dinner dragged slowly along from the soup to the grouse and the entrée, and the sweets afterwards. There were the ruddy, lovely peaches, the blooming grapes, the claret warmed to a nicety and poured from the cup given to the last profligate Castlerayne by George the Fourth. To use simple words, Rayne Castlerayne calculated that that jug had cost half a million of money. There are times when the favour of a monarch proves expensive.

'Well,' Angela asked as the door closed behind

the butler, 'tell us what happened.'

'How impatient the girl is!' Mr Castlerayne protested. 'Gertrude, the grouse had not been hung quite long enough. Oh, the action? Craggs was quite right. Indeed, I was told yesterday morning that I had a poor case. I was advised then that it would be better to withdraw, and save a hundred or two in lawyers' fees, but I refused. Couldn't give in like that, you know. Most tiresome case all along. Those fellows talked and argued until I didn't quite understand whether I was plaintiff or defendant. But the judge held that the hospitallers had a vested interest in the Common, and that they had the right to use it for their benefit, provided that they don't sell it, or dig for minerals, or anything of that kind. Very annoying; but at any rate nobody can blame me for the hotel that is going to be erected on the Common. Not that I've done with Craggs yet by any means. I shall certainly take the case to the Court of Appeal.'

'But that will want a deal of money,' May protested. 'How much do you think has been spent already in this action? But I suppose you have no idea.'

Mr Castlerayne poured himself out another glass of claret with a judicial air. As he sat there, well groomed, smart, debonnaire, he did not in the least resemble the bankrupt that he really was. He was surrounded with every luxury, with the reflected refulgence of absolute prosperity; in short, he was the head of the Castleraynes. There was something like a frown on his face as he turned to May.

'My dear child, you pay a poor compliment to my intelligence,' he said. 'It is not to be supposed that I have gone into the unfortunate action with my eyes shut. I gathered from my lawyers to-day what has been expended up to now.'

'Was that after you had broached the question of an appeal?' May asked.

'Well, yes. I am bound to admit that it was. I told Summers that I could not possibly allow matters to end in this unsatisfactory verdict. He reminded me that from first to last I had incurred a responsibility of some fifteen hundred pounds.'

'Every penny of which you will have to pay,'

May suggested.

'That, I understand, is the position. I either pay

up, or I appeal. If I appeal and win there is an end of the matter.'

'And if you appeal and lose,' May asked, 'what will happen in that case, dad?'

Mr Castlerayne declined to discuss the matter further. He had quite made up his mind what to do, and as head of the family he could not tolerate any interference. Furthermore, he wanted to know if anybody had seen his cigar-case. He had no feeling of animosity against Craggs, though he confessed that he was a little ashamed at the fellow's ingratitude.

May had a mind to ask where the ingratitude came in, but she wisely refrained.

'There is only one thing I should like to know,' she said as she rose from the table. 'It is quite useless to talk about an appeal. Mr Summers will refuse to do anything of the kind till you have some security for his expenses. What I should like to know is where the fifteen hundred pounds is coming from. Seeing that we are not in a position to pay for the necessaries of life—such as grouse, and brown trout, and the like—where is this big sum coming from? I ask this because I should like to know how soon it will be necessary for me to get something to do.'

Mr Castlerayne frowned at his claret-glass. He saw some parallel between himself and King Lear. He was pained to find that his every action did not meet with the entire approval of his family. Doubtless the money would come from somewhere. Summers was a clever fellow, and he could devise some scheme. That was what lawyers were paid for. Meanwhile, he would like to know what had become of that day's Times.

'He's absolutely hopeless,' May sighed as she took a seat in the drawing-room. 'He is quite as unreasonable as any child. Aunt, what are you crying about?'

Two large tears gathered in Aunt Gertrude's eyes and rolled down upon her knitting. She looked like a guilty child about voluminously to confess to some fault.

'It's so dreadful, May,' she sobbed. 'I'm glad Angela is not here. Angela is so hard at times. She never seems to feel anything.'

'Oh yes, she does,' May said. 'She has gone to bed. Whenever Angela goes to bed early it is to have a good cry. She is at the present moment weeping on her lonely pillow. And now, what are you blaming yourself about, you dear old thing?'

'I'm blaming myself, May. It is all my doing. I gave Craggs nearly all I possessed to fight this case. I could see that we could not last very much longer. I could see that everything would have to go. It was only by drawing on my savings

that I kept certain creditors from taking serious steps. But it was the future of the hospital that troubled me, May. I could not sleep at nights for thinking of it. There was a plain and sacred duty before me. It would have been such a mean and despicable thing to let those people go to the workhouse. And yet I could not possibly see how to avoid it. And then when things got to the very worst, when Craggs discovered that it was I who was keeping up the funds of the hospital, he told me what he had discovered years before: that the hospitallers had a vested right in the Common. That was after the hotel scheme was mooted. I knew that in ordinary circumstances your father would never consent to the project, and saw in it rent enough from the hotel to save the hospital. But Craggs had no money. Oh, if you only knew how I was torn and distracted! I prayed for guidance. I could only see a way whereby I should be guilty of treachery to my own flesh and blood, and yet not to do something would have been more wicked and unworthy. So, in the end, I gave Craggs that money. And in my heart of hearts I am glad that I did so. I am glad that I acted so. I could not possibly go on like this much longer, May.'

'Of course we can't,' May cried. She rose to her feet and paced up and down the room. 'I can see quite plainly what is going to happen. The largest sums of money are represented by lawyers' costs. They will not spare dad as his poor creditors do. They will compel us to sell this house and all the family treasures. We ought to have done it ourselves years ago, and retired to Hardborough as the Montagues did. Those Romneys and Reynolds and Raeburns would fetch a small fortune, to say nothing of the silver and the Empire furniture. And then we can go about with our heads in the air and boast about our ancestry with a feeling that we are not taking the bread out of the mouths of other people. We will take a little of the surplus and open a shop in Hardborough, and sell a few hundred bales of that knitting that you have been engaged upon for the last half-century. I am going to write to Mr Warrener and ask him to come down to-morrow.'

Aunt Gertrude blushed and looked a little uneasy. May laughed, though there were tears in her voice all the time she had been speaking.

'Confess it,' she said. 'You have done something wrong. Naughty child! what have you been doing?'

'It's Clifford Warrener,' Aunt Gertrude whispered.
'I—I have written to him myself, and he has promised me to come and see us on Saturday.'

(To be continued.)

FRENCH AND BRITISH COLONIAL METHODS.

By HERMANN G. HARRIS, B.A.

FEW years ago I was on my way to Egypt, sailing from Marseilles by the 'Messageries' steamer, when I happened to share a cabin with a French gentleman who was being

sent out by his Government on a tour of inspection of British colonies. His instructions were to visit Egypt, India, Australia, New Zealand, and Canada, and then report on our methods of colonial administration, no doubt with the hope of thereby increasing the success of French colonies.

It was an eloquent though silent tribute to the marvellous results that have followed British rule in any part of the globe, which are deservedly the envy and admiration of other nations. It set me thinking: 'Have not the French something to teach us in such matters, and would it be worth the while of our Colonial Office to despatch a representative with a similar mission to the foreign possessions of France?'

I could not easily rid myself of this thought. I had been born in India, where my father held a high position in the Indian Civil Service; and after competing my education in England I had spent some years in the French colonies of Tunis and Algria, where extensive journeys had brought me in contact with the natives, whose language I had soquired, and into whose life and thought I had obtained considerable insight. They had told me in confidence things that they would have confided to none but an Englishman.

Several times when travelling with my tents and camels in the outlying parts of these provinces I was risited by Arabs of good position, and after the castomary interchange of civilities, the eager request was urged upon me that I might obtain for my taken the rights of British citizenship. Keen was its disappointment my guests felt when I had rectully to inform them that money alone could be secre that privilege.

In this and similar ways I was permitted to set behind the scenes, sometimes as host and nore often as guest of Arabs of some education and standing. I never found any of them satisfied with French rule. They accepted the inevitable with true Moslem resignation outwardly, though all chaing within at the yoke of an 'infidel' power.

It is not, therefore, to be wondered at that my akin companion's mission set me thinking, and that during the next four years that I spent in Egypt I made many a mental note as to the differences in pirit, methods, and results between the colonial siministration of these two great friendly powers.

I am well aware that for political reasons the Foreign Office still maintains the polite fiction that

Egypt is not a British colony; but it is such notwithstanding for all practical purposes, though the existence of the mixed tribunals and other rights granted to certain foreign countries under the 'capitulations,' as well as the jealousy of some of the foreign Commissioners of the Egyptian Debt, has hampered considerably our development of the country. These considerations only serve to bring out in stronger relief the success of our administration and the marked progress that may fairly be attributed to British influence, energy, and wisdom.

Now, it is noteworthy that the British have been supreme in Egypt since 1882, and the French in Tunis since 1881. What results can each show for a quarter of a century, and to what are these results to be attributed?

Firstly, the great mass of the people seem to be far more contented under British rule than under French, and in northern Nigeria there has been considerable emigration from the French and German spheres into the British ever since our rule was firmly established. This shows that there must be some marked characteristic of British rule that the native mind appreciates. What is it? I believe it is that there is less of a gulf between the native and the Englishman than exists between the native and the official of any other nation, as the following considerations indicate. The Englishman is more ready to trust the native, and nothing wins the confidence of children or of natives like making them feel that you trust them. Probably the Englishman has a quicker insight or intuition of the native's character, recognising good qualities where they exist sooner than a Frenchman would, and then he honours the possessor of them and treats him as a man and in some sort as an equal. This always has an inspiring effect, and begets reciprocal trust and satisfaction. The officials that make a Government unpopular are those who sneer at every man whose skin is a shade darker than their own as a 'nigger,' and who maintain that the 'touch of the tar-brush' makes it impossible to treat him as anything but an inferior being, as if the worth of character under a dark skin could never equal that under a white one. Now, it is this assumption of superiority, the haughty tone, that keeps the native at arm's-length, and constantly reminds him that you consider yourself to be on a higher level than he; this, I think-which happily is the exception with the British official-is the rule with the French. Unfortunately, the exceptions that occur are so pronounced and blatant that they do us a great deal of harm; but, in spite of these, the native subjects of the British Empire recognise on the whole that they are fairly and kindly dealt with by men who do their best to come down to the level of the natives and to appreciate all that is good in them.

As only one symptom of this spirit, notice that the French military men never wear mufti in the colonies. The officer is always in evidence in his uniform, as a constant reminder of the power of the sword by which the country has been subdued; whereas the British officer constantly wears civilian dress.

Again, we content ourselves with holding strongly a few strategic points, but French military posts are legion. Travelling on the southern slopes of the Atlas Mountains, hundreds of miles from anywhere, you arrive at a little native village-for example, Negrin, a few score mud-houses, a cluster of palm-trees, and a stream of water. You expect to be quite undisturbed by Europeans; but no, there are the inevitable blockhouses; and presently a French soldier comes to you to say the commandant wants to see you. The latter turns out to be a young French subaltern, who with half-adozen men swaggers as a petty king in the little village. Nothing like this exists under British rule, where every possible post is filled by Thus, in Egypt, in every small town or village such appointments as officials of postoffices, telegraphs, and railway stations are all filled by natives; whereas in Tunis and Algeria all such petty places are occupied by Frenchmen, eking out their existence on a trifling sum, it is true, to a European, but one which would be a big salary to a native, and go further to make him satisfied with French rule than anything else that could be done. The French seem to look upon a colony as a sort of dumping-ground for small officials of customs, excise, telegraphs, post-offices, and every other grade; whereas the British seem to make it a rule to employ native agency as far as possible for such work, the latter only needing to be occasionally looked after by a European district inspector.

As regards commerce, again, France has been playing a selfish game by her protective tariff; but it has really injured her colony more than it has benefited France, since the colonists as well as natives,

owing to the tariff, have not been able to buy the best goods in any market, or even to supply themselves sometimes with the materials required for their own manufactures or domestic use.

Again, France has been far more slow than Britain to develop the natural wealth and the mineral resources of her possessions. For instance, the minerals of Tunis are as yet barely touched, yet as an asset they are quite as valuable as the agricultural produce of the Nile valley. It is calculated by experts that the iron-mines of Tunis alone would yield forty million tons of ore giving fully 50 per cent. of iron. But the French Government have been very chary in spending any capital on the development of such sources of wealth, while the British, by contrast, have not hesitated to sink millions of pounds on the great dams at Luxor and Assiout, which have added tremendously to the agricultural wealth of Egypt.

One or two things, in drawing to a close, we must credit France with doing better than the British—namely, general sanitary administration, and enforcing a proper standard of weights and measures, with due inspection of the same. In these respects Egypt lags far behind Tunis and Algeria.

And, lastly, if we contrast the great Custom-House at Alexandria with that at Tunis, the comparison is all in favour of the latter. At Tunis only two officials need to sign the manifesto enabling a merchant to obtain his goods in halfan-hour at most, often in fifteen minutes; but at Alexandria you have to dance in attendance on no less than thirteen native officials in as many different bureaus, several of whom take care to keep you waiting if you happen to be an Englishman, for they must have a cigarette between It reminded me strongly of Turkish whiles. custom-houses, only there one expected to pay the backsheesh, and did not grumble; but under British rule one could not do so for the honour of the flag, and had to spend one's precious time in vain wondering whether ever we in Egypt should take a lesson from the French in this respect that would bring blessing to every traveller and trader in the land of the Nile.

SLIOCH'S TREASURE.

CHAPTER II.

OMMANDER HARDY turned from the disappearing wagonette to a prolonged contemplation of the sky, and finally, with a baffled look on his face, adjourned to the library.

His uneasiness about the weather was then for a time displaced by an energetic attempt to reduce his arrears of correspondence, and nearly an hour had elapsed when a sudden darkening of the room brought his pen to an abrupt stop, and in a twinkling he was at the door. A glance

indicated to his experienced eye the imminence of some great change, and anxiously he sought the barometer in the hall. It had fallen considerably; the mercury was markedly concave, and he fancied that even as he looked it seemed to shrink in the tube. Mrs Benbow joined him as he stood staring at the glass, and turned with him to the door. Not a word was spoken as they gazed at Ben Beannach. As yet high above it, a tremendous mass of darkly lurid cloud was driving with immeasurable swiftness straight over its top. Short, sharp puffs of

wind now and again whirled the gravel about and smote the cheek with a blow like that of a soft pillow. Patches of spoondrift appeared here and there on the loch, and the yacht swerved uneasily with her low to the wind.

'I think you should go indoors,' said Commander Hardy gravely to Mrs Benbow, 'and see that the housemaid closes the abutters of all the windows iacing the north and east. I will signal to the men on the yacht to get up steam. I would go on board, but I don't want to leave you unless it is absolutely necessary.'

On the flagstaff in front of the house Commander Hardy ran up the flags signalling 'Raise steam for full speed,' and waited until the order was acknowledged by those on board. He then entered the house, and having satisfied himself that the shutters to the north and east were securely fastened, he joined Mrs Benbow in the drawing-room and reported what he had done. Little passed between them as Commander Hardy paced up and down the room, stopping every now and then to gaze at the scene outside. For a while the only change was an increase in the number and force of the gusts and a perceptible whitening of the loch about half a cable from the shore. Then suddenly, and with an appalling rush, the wind roared like the burst of ten thousand rockets, and the storm of a hundred years was raging.

When the shock of the first awful blast was over, Commander Hardy left the room to see if any damage had been done to the house. Nothing apparent, had given way; and on his way back to assure Mrs Benbow that all was right so far he locked at the barometer. It had fallen to 27.8! Taking with him a powerful field-glass which hung in the hall, he returned to the drawing-room, and tier reporting his inspection to Mrs Benbow, tent to the window and steadily watched the yacht direct the glass.

By Jove, he suddenly cried, 'she's dragging her achor! Mrs Benbow, I'm sure you are all quite sie here; but the yacht, I fear, is in great danger. There are only two men on board, and they need belp if ever men did. You really must excuse my baying you; and with that he tumbled downstairs. A les geps took him out of the shelter of the house; ai then, in a breath, he found himself, battered and apless, among the boats drawn up close under the let of the big storehouse near the small pier. A since showed him that the yacht's gig was gone; that the fishing boats drawn up on the beach were but too heavy to launch and too large to be anged by one man; so after a second's hesitato he stripped, and running along the pier, was tenlly blown into the water. Now and again as be was buffeted down the loch he caught a glimpse of the Jacht, and marked with satisfaction that though she was still dragging her anchor she was sing atem very slowly, and was exactly to leeward of there he was. His chief difficulty was to get saiches of air amid the swirling foam; but his

enormous lung-capacity stood him in good stead, and as the yacht hung for a moment or two almost stationary he made his effort and managed to seize the cable. Getting his head well out of the lashing spray, he took two or three deep breaths and shouted to the men on board. Again and again he hailed them, but to no purpose; and he was just considering the possibility of climbing up the cable. when the yacht was brought up with a jerk that flung him back into the water. The anchor had evidently caught in something which held it fast. and the men rushed up from the stokehole to the bow to see what had happened. Fortunately, they caught sight of Commander Hardy, and quickly fastening a rope to a life-buoy, threw it to him. A few minutes more and he was standing on the yacht's deck. Without a word of explanation, he roused the half-dazed men to help him to veer the cable. This done, he made for the engine-room, terribly anxious to ascertain how far steam had been raised. The pressure was still far from sufficient, and at all hazards steam must be got up; so, lowering the cask of oil used for the lights into the stokehole, they used it at the risk of their lives, and speedily had the intense satisfaction of being able to start the engines slowly ahead. By acting as stoker in turns they kept the yacht at bay before the storm till, almost as suddenly as it had risen, the wind fell and all immediate danger was at an end.

Commander Hardy now turned to consider the possibility of returning to the head of the loch in order to relieve the anxiety of those there. To weigh anchor was out of the question. One boat had been used to take the crew ashore; the other had been literally blown away by the first onslaught of the wind. To swim ashore was possible for him when fresh, but before he could reach a landing-place from which he might walk to the head of the loch a long swim against the wind and ebbing tide was necessary, and in his exhausted state was not to be thought of. There was, therefore, nothing for it but to remain where they were meantime, and to make such signals as they could which had any chance of being noticed. A flag was run up to the main truck, and rockets were fired at intervals. Half-an-hour passed, during which the gale continued to abate, when round the farther-out point came a large fishingboat filled with men pulling as if in a race. Standing up in the yacht's bow, Commander Hardy waved his handkerchief, a signal at once responded to from the boat, and in a few minutes Captain Corbett and the crew, reinforced by some of the fishermen, boarded the yacht and eagerly congratulated the three on their safety. The fishing-boat was secured by the painter and allowed to drop astern, and all hands started to weigh anchor. It, however, defied every attempt to move it, so at last they alipped and buoyed the cable; and the Senta proceeded for the top of the loch.

CHAPTER IIL

UR road to the church ran nearly at a

right angle with the loch, and during the drive the oppressiveness of the atmosphere somewhat lightened. The stillness of the air gave place to sudden eddying blasts of wind, increasing in frequency and violence as we neared the church, and right glad were we to seek its shelter. The walls and roof of the church were of the most solid old-time construction, and the few small windows shut out the gathering storm with the effectiveness of a ship's scuttles. The service began in solemn stillness, which yet had something of a throbbing unrest about it. By the beginning of the first prayer echoes of the external tumult flitted here and there through the church, and took a deeper and graver note as the darkness deepened and the sough of the winds became more audible. Even as the minister was ending the prayer with 'And now unto Him who is able to keep us from falling,' the storm broke, and the solid walls seemed almost to cower before its awful blast. The minister stopped abruptly, and for a few minutes all stood motionless, appalled. Then, with a voice no longer grave but triumphantly ringing with the certainty of his own soul, he repeated, 'And now unto Him who is able to keep us from falling.' Something of his faith and trust these clarion words awoke in us, and the service proceeded in a spirit of humble but assured devoutness which through many years influenced the lives of us all. Before the lengthened communion service was finished the storm had abated; but it was with hesitating

for us indeed and in truth the Sanctuary of God. Outside, the earth 'deep scars of thunder had entrenched;' but now the wind, weakened and exhausted, only spat impotently. While in church I believe none of us had given a thought as to what might be happening at Eriboll, but with a scene of devastation before us anxiety sharpened us to immediate action. By the Admiral's orders, Captain Corbett and most of the yacht's crew joined us in the wagonette; and a large springcart was filled to its utmost capacity with the fishermen of the village. Swiftly though the willing horses carried us along, the drive seemed interminable, and there was a hearty 'Thank God!' in all our hearts when at last we saw the Admiral's wife standing at the drawing-room window. As we tumbled out of the wagonette she met us at the door, and in a breath we learned of Commander Hardy's disappearance and that the yacht had gone. Some were at once told off to search for him, while the captain with his crew, supplemented by some of the fishermen, launched one of the big fishing-boats and hastened along the now comparatively quiet loch, with the result set down in the previous chapter.

steps that we made for the door of what had been

Monday proved an ideal summer day. The air

felt clean and washed, and it was good to live. All the landsmen save myself set about repairing the damage of the previous day, while I, at my special request, accompanied the Admiral and Commander Hardy down the loch in the yacht for the purpose of attempting to recover the abandoned anchor and cable. On reaching the buoy to which the cable was attached a boat was lowered, and soon the free end of the cable was in the grip of the donkey-engine. All attempts, however, to move the anchor again proved futile, and the captain had reluctantly given orders to slip the cable, when Commander Hardy intervened and proposed that, as we were only in about six fathoms of water, he should be allowed to descend and attempt to find out what the anchor was fast in. He appealed to the Admiral for confirmation of the ease and safety with which he could remain under water for a considerable time, and at last obtained permission to undertake his proposed task. He stripped, a life-line was fastened round his mighty chest, and at his request he was lowered until he rested in the water with his hands grasping the cable. We saw him take one or two long, deep breaths, and then he disappeared below. Nearly two minutes had passed when he bobbed out of the water like a cork, and after a few gasps signalled to be drawn up on board.

'Well, Hardy,' said the Admiral, with a smile, 'I'm sure the men thought you were drowned. Have you discovered anything?'

'Rather!' almost whispered Hardy. 'Give me five minutes to dress, and let us then meet in the cabin.'

Thither we went, and when Commander Hardy joined us the Admiral exclaimed, 'Come on now, Hardy, out with your discovery! Is the anchor fast in a crab-creel, or has a limpet belayed the cable?'

Captain Corbett smiled grimly, but Hardy gravely said, 'Admiral, the anchor is fast in a submerged wreck, and that wreck, if I am not very much mistaken, was once old Slioch's yawl.'

He paused, looking at us; and the Admiral said lightly, 'We must just slip the cable, then, I suppose; but if that is all, why this mysterious consultation in the cabin?'

'Yes, that is all I found out. But surely you see the importance of the discovery if I am correct in thinking we have found where the yawl is sunk.'

The Admiral and I looked puzzled, but Captain Corbett started to his feet with what I have no doubt was a Gaelic oath, and suddenly lowering his voice, hoarsely whispered, 'Then we may find the treasure yet.'

'Yes, Admiral,' said Hardy, 'that is what I mean. You remember that the man who is said to have been old Malcolm's father was the only one of Slioch's crew who escaped when the yawl was destroyed, that for a year or so afterwards he was reputed to have been rich far above his station in life, and that he suddenly disappeared at the time

when Malcolm must have been a lad. While it is certain that after the destruction of the yawl he alone knew exactly where the treasure was concealed, it seems equally certain that he never communicated his knowledge to any one who has ever been in this district. But'-and Hardy suphasised the point as he leant across the table-'Malcolm appears to have known at least this: that the hiding-place of the treasure was opposite or nearly opposite the spot where the yawl sank, for before his dotage all his spare time is believed to have been given up to searching for some signs of the wreck, and as his mind grew feeble he is said to have occasionally explained his apparently aimless sailing up and down the loch by saying that if he could only find the wreck he could get the treasure. But be this as it may, two things run through all the traditions of this place—namely, that he who would find the treasure must first find the yawl; and that, though the treasure is to be found on dry land, it can only be reached by swimming.'

'Ay, Admiral,' burst in Captain Corbett, 'that's gespel truth; and if a whisper gets abroad as to the whereabouts of the wreck there will be no more shing this year. Every mother's son will hunt the place like a pressgang. Well is it, Commander Hardy, that you have told us here; though I'm fair leat to think how you can only reach a place on dry land by swimming. Why, there's not an inch of the lochside you can't touch at with a boat!'

Just my difficulty,' added the Admiral.

'Come, now, Hardy, the captain's set you a

nice conundrum. What do you propose to do

'As for the treasure,' responded Hardy, 'I must have time to think. Meantime, I advise that our exact bearings be taken and marked on the chart of the loch, that this be done as unostentatiously as possible, and that we slip and buoy the cable again, and go home with the understanding that not a word is to be said about the subject of our conversation at present, except, of course, to Jack.

'Right!' exclaimed the Admiral.- 'Captain Corbett, take all the men forward to unshackle and make ready to secure the cable, and while they are engaged there Hardy and I can take our bearings without raising any curiosity.'

We accordingly went on deck, where the captain intimated that Commander Hardy reported the anchor too firmly fast to be weighed, and ordered all hands forward to slip the cable. While they were so engaged, the Admiral and Commander Hardy seemed to be aimlessly looking round the yacht, though I saw each as he turned his back to the bow jot down certain notes in pencil. By-and-by the captain came aft to report the cable unshackled. It was then buoyed and slipped, and we returned to Eriboll.

That night in the smoking-room Jack was told of our day's experience, and Captain Corbett's conundrum was guessed at in vain: 'What kind of place can it be which, though situated on dry land, can only be reached by swimming?'

(To be continued.)

WHAT ISMANJAK?

By P. CARMODY, F.I.C., F.C.S., Trinidad.

T the Colonial and Indian Exhibition, held in 1905 at the Crystal Palace, a bulky exhibit of manjak was shown; and it is probable that of over a million visitors only a very small

fraction had ever seen or heard of the substance before. This need not surprise us, or manjak is found only in a few places, and usually a small quantities. The exhibit in question formed art of the mineral section in the Trinidad Court, and was accompanied by its near relations, liquid and solid asphalt, petroleum oils, and lignite. from the neighbouring colony of Barbados manjak his been exported for many years; but the recently dereloped Trinidad mines contain probably the argest deposits of this substance in the world.

In April 1906 manjak, in a state of jelly, was Captered washed up on the shore and rocks at Rubhbele, on the northern coast of Barbados. This, it was thought, might tend to prove that the hanjak mines in this place are probably offshoots lon a large bed somewhere in the Caribbean Sea, valid has a fissure through which this mineral is broad by the subterranean fires that seem to extend beneath the majority of those islands, as it must have taken a heat of considerable magnitude to reduce the mineral to a jellified consistency.

In outward appearance manjak somewhat resembles coal. It is black, brittle, and lustrous. But its composition is very different from that of coal, as the following results show: water, 1 per cent.; bitumen, 89 to 96 per cent.; ash, 4 per cent. Fractionally distilled, it yields: below 150 degrees centigrade 0.5 per cent., from 150 to 300 degrees 21 per cent., illuminating oil; above 300 degrees 18 per cent. lubricating oil and 55 per cent. coke. It softens at about 200 degrees centigrade, and melts at about 220 degrees, and at below 150 degrees it gives off large quantities of inflammable gases.

It is, therefore, closely related to ordinary Trinidad asphalt, and is, indeed, a very pure form of asphalt. Solid asphalt, as found in Trinidad, which is the chief source of the world's supply, usually contains not more than 55 per cent. of bitumen, the remainder consisting of nearly equal proportions of mineral matter and water; but the liquid asphalt is wholly bitumen and oil. It is, therefore, evident that the origin of manjak is this liquid asphalt from which, by natural evaporative processes, the liquid portions have been removed. It appears on the surface of the ground to a very small extent; but these appearances indicate the presence of larger deposits below, and the two mines in Trinidad, which are adjacent to each other, and not more than a dozen miles from the far-famed Pitch Lake, are now being worked to depths of about two hundred feet. The underground deposits, though extensive, are not continuous, but occur in seams like coal, and are worked similarly. The deposits are usually lenticular in shape; and, as might be expected, those found at the lower depths are purer and better than those found near the surface.

The uses for which such a substance as manjak is obviously suitable are electrical insulation, water-proofing cloth or paper, and the manufacture of superior black varnishes. It is said to be used for compositions sold as rubber substitutes; also, as a paving material, but this is extremely unlikely, as it is too pure to be used for such a purpose. Hitherto neither the demand nor the supply has been very great; but the development of these two mines in Trinidad, and the probable existence of other mines, render it likely that this substantial addition to the world's visible supply of manjak will considerably extend its present sphere of utility and stimulate inventors to find new uses for it.

AN ADVENTURE ON THE AMAZON.

By F. B. Forester, Author of My Midnight Visitor, Held to Ransom, &c.

USTRALIA, India, South Africa? Well, yes, I've been over them all; had pretty stiff adventures in most of 'em, too. But I don't know that I ever came in for anything stranger in the way of an adventure than the

one I'm going to tell you about, and it came off in South America, in the forest regions of the Lower Amazon.

I was engaged working for a rubber-dealing company at the time, and the meaning of this was that we had a good many Indians as well as negroes constantly at work tapping the trees for us. Their business, as I take it most people know, was to collect the sap of the rubber-trees (the indiarubber of commerce), and mine was to visit these fellows at their work, keep them up to the mark, and at the same time see that none of our stuff got into the hands of any of the Portuguese traders who were incessantly on the prowl, doing their best to bribe and corrupt our men.

It was a pretty lonely life I led, now I come to think of it, week in and week out; but at the time the thought of its loneliness never struck me. There was something in my nature that seemed to respond to the silence and utter loneliness of the vast forest round me; and in all my solitary journeyings from place to place after our men I was never conscious of anything beyond a sort of awed delight in the utter grandeur and beauty of nature, as seen in the wild places of the earth. However, if I had only known it, I was destined to have a good deal more than I liked of solitude and silence, and that before very long either.

Well, I was on my way from one outlying post to another, one day towards the end of August, when, the rainy season being supposed to be over, the waters had as a rule subsided, and the rubber-collecting time had just begun. But the river was still pretty high, and the sky—all that there was visible of it through the tree-tops, that is to say—had looked so gloomy and threatening ever since

noon that I hardly felt surprised when, towards sundown, a sudden and ominous darkening above gave warning of the approach of a storm. 'In for a tormenta, I suppose,' I muttered to myself, and forthwith set about looking for a spot in which to

escape the coming deluge.

From choice I would not have cared to be benighted in the forest; but there seemed no help for it, and small chance indeed of reaching the camp of Indians to which I was on my way. I knew better than to try it, anyhow. Of wild beasts I had no fear—my revolver safeguarded me on that score; but I had a mortal horror of snakes. And to set my foot upon a hideous rattlesnake in the darkness, or else upon the as deadly jararáca, was a possibility I would willingly have fought shy of. So I decided to camp where I was, under the thickest and densest tree I could find, there to await the coming storm.

I was pretty close to the river, so close that the sound of the water lip-lipping at the banks was in my ears distinctly as I crouched in the shelter I had made by matting the huge, fleshy, heart-shaped leaves of the pothos plant together, and waited for the storm. Of course, in saying river I don't mean the mighty Amazon itself; although one might have been readily pardoned for thinking as much, since the opposite bank of this, a comparatively insignificant tributary, was scarcely visible in the

half-light of the approaching hurricane.

So there I sat and waited until the first moaning shriek of the wind sent the tall trees bending and swaying like reeds before it; the heavy drops pattered through the leaves, and with a howl like that of a legion of demons the tormenta was upon me. An hour later I crept like a drowned rat to the opening of the little cave of leaves I had made for myself, and looked out. The fury of the storm had gone, and the stars were shining. I was pretty wet, of course, but that was nothing new to me in the way of an experience; and of food I had none, having anticipated eating my supper in company with our

rubber-hunters. However, there was no help for that either; and, failing anything better, I crept leck into my lair, resolved to wait there until morning. The spot on which I had crouched during the raging of the storm was at all events dury by comparison, and if I could get some sleep so much the better; and I did sleep, a little too soundly perhaps. It would have been a good deal better for me if I had not sleep at all.

I woke suddenly and with a start, as a man might wake during the progress of an earth-quake shock, conscious that the solid objects around him were moving. For that was how it seemed to me. Not only the trees, but the ground underbeath me, without a shadow of doubt, was in motion. For a minute I was fairly at a loss to understand what was going on. Then, all in a fash, the knowledge came to me. The mass of bashes and dense undergrowth beneath which I had made my lair had during the night, thanks to the incessant sucking and tearing of the river, become dislogded; and it and I with it were sailing down the current at the rate of fifteen or twenty miles an hour.

Just at first I was so thoroughly taken aback by this discovery that I didn't know what to do. As soon as I was capable of taking in facts at all, the conviction struck me that the island, if I could call it that, was bound to go to pieces in a brace of seconds; and I clung for all I was worth to the tree beneath which I had made camp. Whatever might happen to the rest, that couldn't sink, anyhow, and I held to it for dear life. All this time, it must be remembered, dawn had not fairly come yet, and only a faint gray light was visible, enough to show me the swirling waste of waters amid which the uland of tree-roots and fallen trunks that was harbonring me was sailing. But this was a state of things that improved with every moment, and before long it was light enough to let me see clearly. It was not a pleasant prospect. Trees and river, that was about all there was to see; a discoloured rate of angry water sweeping along, and beyond only the impassable barrier of the forest-clothed anks And carried on by the swirling torrent, and fallen trees, and now and then a tangle broken boughs, still held fast together by the stake-like folds of the giant lianas that bound them ha vice-like grip. Last of all, there was my own the island. And in all that waste of water and forest-clothed banks not a boat, not a house, not a on of a living creature to be seen. The world that I looked out on was like the world that one might have looked on during the progress of the

I didn't stop to think much in that vein, though. What concerned me most were the chances that existed of my getting off in safety; and there was no denying that at present these looked remote though. However, there was the almost certainty of the island running aground before long—always apposing that it did not go to pieces first; in

which event, the river being infested with caymans, the chance I would run would be a poor one; and I began to calculate next how long it would be before it did, and whether I might reckon on getting off before I was starved to death. And it was while I was standing on the highest lookout spot I could reach—staring out over the waste of waters in the faint hope of seeing a boat, yet knowing in my heart that the chances were a thousand to one against so much as an Indian's montaria being afloat with the river in flood like that—that I thought I saw something moving close to the brink of the water, at the outermost edge of the island. And after a moment I saw what the object was.

I suppose every one has learned a good deal about South America in these enlightened days; and most people know something by reading or at second hand, if not by actual experience, of the vast forests of Brazil; of the thousands of miles of silent, deep, unknown waterways that traverse its dense, impenetrable solitudes; of the huge, impassable barrier of trees that, rising sheer from the water's edge, shoot up to an almost unknown height into the blue; of the countless leagues of dense network of creepers and lianas, which, sending out long feelers of vivid green, and running-a living carpet-from tree to tree, form a second floor above the roots already embedded in, and the air-roots hanging down towards, mother earth; and of the wealth of animal life inhabiting these dense regions, antathat is to say, tapir-and peccary, jaguar and tigercat, capybara and ant-eater, sloth and armadillo, and monkeys whose name is legion, let alone all the rest, every one has heard since childhood. Birds, too - birds of colours which make the brightest and most gorgeous hues that one can call to mind sink into insignificance as a mere catalogue of names, birds of a resplendent beauty of form and colouring-flit from tree to tree in company with myriads of insects, fit rivals to them in splendour. And then there are the reptiles—ah! for Paradise had its serpent; and though the sun may shine ever so brightly, though the flowers may gleam out in gorgeous beauty to meet his rays, though humming-birds may flash like winged jewels from blossom to blossom, and a myriad insects of hues scarcely less brilliant dance in the sun's rays, still everywhere there crawls the spotted horror, the bearer of death in its most subtle and horrible, sometimes in its most hideous and monstrous, shape.

Ay, there need be little wonder that the story of the giant sloth should not be regarded as a mere myth after all; that the belief, namely, that the giants of earth's early days, the monsters of prehistoric times, wander still in the unknown wilds of Patagonia should have some basis in solid fact. Why not? Stranger things are told than these; stranger still are the legends of the Lamparagua and the yacu mama. I knew little about the Lamparagua—the half-vegetable, half-animal monster believed to haunt the impassable solitudes of the Paraná

River-that, itself said to be capable of movement, seizes and devours the living animals held in its fatal grasp. But I had heard the other legends many a time - they were the common talk of our rubber-hunting Indians-of the gigantic yacu mama, 'the mother of the waters,' the huge, terrible, snaky monster that, as the story has it, lurks in the silent channels and reaches of the Amazon River, believed in so profoundly by the Indians of the district that not a man of them will dare to cross river or lagoon without first sounding a blast on his horn. This, according to his creed, will be unfailingly answered by the monster should it be within hearing, and upon its action depends his own. I knew in what the legend had taken its rise-the living reality of the huge water-serpent, the gigantic sucurujú or anaconda itself. No fiction, but fact, its existence, whatever the rest of the stories may be; and it was with a kind of intuition of the truth that I looked again and more closely at the object that had taken my attention now. And then I saw. No mistake about it, worse luck! There it was at the edge of the island, the huge, snaky

How long it had been there-whether it had only just crawled up out of the water or had lain there all night-there was no knowing. But from the appearance of the skin, wet and shining like a piece of oilcloth, and from the fact that the coils were slightly in motion, I was inclined to think the former. After all, it mattered little. The main point was that the brute was there-on an island barely twelve vards square—and I was there with him. There he lay, the great, shining, speckled heap, just at the edge, beyond the lapping water. the huge mass of him sprawling across the partially submerged logs that formed the island. I fancied I could see them sinking lower and lower in the water with the weight. I could see the tail, twisted fast round the end of a log, its tip dipping in the swirl of water; but all the rest was just a snaky heap, coil on coil, of the great, thick, bloated body. And I-over at the farther side, as far away from the brute as I could get, watching with fascinated eyes-was suddenly conscious of a sense of sick loathing. For if there is any creature on earth of which I have an unutterable horror and disgust, that creature is a snake. Would he be content to lie there inactive until the mood should take him to plunge again into the swirling current, or would he think fit first to explore the limited space on which he at present found himself? And, in the course of that exploration, would he not surely encounter me?

I was not left long in doubt on this score, however. Whatever he might be inclined to do later, he showed no signs of moving at present. He was evidently a great deal too comfortable, and disposed to remain where he was.

This was all very well for him, but for me it promised to be the very reverse. Not being accustomed to take my meals only at intervals of three weeks or so, like my companion, it looked, to begin with—unless unexpected relief should come, and of that there seemed precious little prospect at present—as if a death from slow starvation were staring me in the face, unless, of course, I chose to chance the swim across to the bank; and as the river, I knew, was swarming with caymans, there would be little enough of a show there for me. In the meantime, swept along by the current, my island went sailing on and on merrily, until with a jerk, and in a moment, as it seemed to me, she grounded and came to anchor.

For a few minutes I made no move, expecting that the halt would be only momentary, merely due to the island having caught on some snag or other, and that in a minute at the latest I should find myself sailing tranquilly on again. So I remained in the tree to which I had retreated, some eight feet or so above ground-for it may readily be believed that I didn't care to go any nearer the present company than I could helpand from this post of vantage regarded my surroundings. And then I saw something that made my heart leap suddenly with hope. The bank of the river-the right bank, that is-was still fully a quarter of a mile distant; but straight opposite to where I was moored on my island a long spit, a regular tongue, ran out into the stream, a tangle of brushwood and low-growing trees, but solid ground for all that, and offering, if I could only reach it, escape at all events from the present company. Beyond lay the forest, of course; and as I knew that I must have drifted during the night a good twenty miles down-stream, days of wandering would probably follow before I could hope to get back to my bearings again. However, the river would always serve as a guide; and for the wandering I should not have cared a rap could I only have got on shore. But between the bank and myself there was a great gulf at present fixed, the impassable gulf of the river; and, to add to the general pleasantness of things, I could see that the spit of sand bordering the forest was covered with huge, motionless, log-like shapes—was, in a word, swarming with alligators (caymans, as they are called there). It was a nice lookout!

But things were destined to be even more pleasant. I was still looking towards that far-off spit of solid ground when my attention was caught by a sudden splash and swirl in the brown water alongside, a ripple and wash of the wavelets against the logs, and above the surface was thrust a huge, shapeless head, followed by a log-like length of body. I was going to have another visitor! It might look like a log, but of course it was nothing of the sort. As if it were not bad enough in all conscience to be shut up there with an anaconda, I must have a cayman come to join the party!

I don't suppose it has fallen to the lot of many men to find themselves in a position like that, not only so completely alone in the heart of Nature's fashesses, but actually penned up in a space twelve yards square or thereabouts with a couple of her most terrible children. Naturalists, and possibly some other fellows, might have felt inclined to give a good deal for the privilege, but I didn't feel that way at all. To tell the plain truth, I was getting well-nigh desperate with hunger, and something would have to be done, pretty promptly too. And in the meantime there the two great reptiles lay, as I saw with wrath, on the side nearest to and directly in the way of my getting towards the lank.

I looked down to the lapping water below me—
the tree in which I was perched being over at the
far side of the island—half resolved, in sheer desperation, to risk everything in swimming across;
at then I saw something that knocked that idea
on the head at once and completely. An ominous
ripple in the water close at hand, and then another;
and even as I looked I could see the long, log-like
back, and nearer the small prominence just showing
above the surface, where a cold, cruel eye glared
along the water, watching, waiting, only biding its
time.

That settled it. I don't think I was more of a oward than most men; but the thought of being sized drawn under water, and devoured by one of these lurking brutes was beyond me, somehow. But the sight of the watching monsters riled me so that, without giving a thought to the folly of it, I reached for my revolver, meaning to try the effect of a paol-shot on the owner of the eye. That shot herer came off. I had forgotten the crown-like braches of the tree in which I was perched, rising in a circle round me; and just as I snatched the resolver from its case one of these same boughs caght me smartly on the arm. Splash | punk | ad, like the bubble on the fountain in the poem, that revolver was gone and for ever. And there at I perched in my tree with not a weapon on ne barring my knife, and getting more like a amishing wolf every moment; while below me, on the half-submerged tangle of logs and brushwood that formed the island, the fifteen or twenty feet o carman, and the probable thirty of coiled-up tracenda, slept as unconcernedly as if there had been no such thing as myself in the world.

All at once a thought struck me. To swim across wald, it was clear, be just playing into the hands—just rather—of the caymans lurking under water. But what if I could ferry myself across by means of a feating log?

The more I thought the thing over the more is commended itself to me. I looked at the water drilling past, and told myself that, the island having magnuad, there could be no great depth between it and the river-bank—not too great, anyhow, to study in the way of my poling myself over. There footing on the log and being precipitated into the part of the death waiting for me; besides, I knew well enough that these great brutes had an ugly

trick of bringing their prey within reach by dealing it a blow with their tails. But something would have to be risked. I was not going to stick on that island and starve, nor yet would I spend another night there in the present company. Not if I knew it.

The first thing to be done was to secure a pole and a log. Thanks to the strong, sharp knife at my belt, the first was provided easily enough. And then I looked round for a log. That was not quite so easy to come by. For, to put the thing in a word or two, the only log available—the only one that would serve my purpose at any rate—was the identical one upon which, half in and half out of the water, the sleeping serpent lay. That settled it. I meant to have that log; and, with a bad will or a good one, that great brute had got to be made to move. But how?

Sitting up there in my perch, I reviewed the position; and having come to the conclusion that I was screened completely from view by the foliage of my tree, the long, broad leaves of the wild banana, I began cutting away at the boughs of others within reach until I had got my pockets filled with about thirty or forty little sticks about as long as a clothes-peg, and a good deal thicker and harder. Then, cautiously, without exposing my arm or any more of myself than need be, I set to work vigorously to pelt the sleeping snake. For all the impression I made at first I might as well have pelted a log of wood. But after a little I began to see that my attentions were not without effect on the serpent. I hit him always in the same place, aiming carefully, and it began to be evident that the great reptile did not like it. After I had flung about twenty sticks at him, I saw a sort of quiver run through the vast bulk; it moved uneasily; from the middle of the huge bloated mass was protruded a small, wicked-looking head; the whole great body writhed as it lay; and I knew that the snake was on the move. There is no good denying it. As I saw that the huge reptile, irritated by the persistent hail of missiles that had rapped against his scales, was bent on finding out the cause thereof, I would have given a good deal never to have flung a single stick. But it was too late now. I realised that as I saw the serpent, with an angry hiss and a forward writhing of his body, start to survey the island. Till that moment, when I saw the contrast between the great swollen body and the thin neck and tail tapering to a point, I had never realised to the full the hideous appearance of an anaconda.

How the thing actually happened I don't know. One well versed in the life-history of these great reptiles, and familiar with their habits, affirms that in his opinion the snake, through being about to change his skin, must have been half-blind. Either that, or else, having been irritated beyond endurance, he was bent on wreaking his vengeance on the first object he came across. Otherwise, he never would have transgressed that strange law usually obtaining in the animal world among crea-

tures of like size and strength, the law of 'Touch me not,' but for the observance of which the wild regions of the earth would soon become depopulated. Even as it was, on coming into contact with the huge, log-like body of the cayman lying directly in his way, he seemed to recognise something of this, for he drew back momentarily. But there was no drawing back about the alligator. As the latter felt the touch of the serpent he swung suddenly round, and with a movement so lightninglike in its rapidity that there was no following it, caught the anaconda by one of the thickest of the coils, and held on with his array of sharp, lacerating teeth.

And then came a scene to which words will do but poor justice. Caught in that way, the first instinctive endeavour of the serpent was to fling his coils around the body of his assailant. But the terrible grip of those powerful jaws seemed to paralyse him; and, although to a certain extent he succeeded in tightening his coils on the cayman, little impression was apparently made on the mailclad body of the latter, and he still held on doggedly to the giant snake. The water, dashed into foam by the lashing of the huge tail of the alligator, was flung here and there in sheets; the whole frail structure of the island rocked with the desperate conflict; and I, watching from my tree, expected every moment to see the entire consistency of my place of refuge give way. It was a titanic struggle between two of the giants of the reptile world such as does not often fall to the lot of man to see, and a sight, once seen, not to be easily forgotten; and so profoundly did it impress me that, in spite of the seriousness of my own position, for a long time I could think of nothing else. Hoarse, strangled bellowings from the cayman, one or two frenzied but feebler flaps from the tail of the serpent, as if the grip of those terrible jaws was at last beginning to tell; and then, as if the ground had suddenly given way beneath them, the two huge combatants, still inextricably locked together, rolled-for it seemed like nothing else-into the water, where, after one moment's agonised struggle on the surface, they disappeared with a heavy, sounding plunge into the unknown depths below.

I didn't go down for many a long minute after that. One of the pair must be victor, I knew; and the thought that the one might emerge from the water presently and crawl up on the island, bleeding, maimed it might be, but still capable of doing me a very material injury, held me back. But, although I watched and waited long enough, nothing came. Of the terrible conflict which must have been waged there under water until the issue was fought out nothing showed above. I don't know which was the victor.

I shook off these thoughts at last, and going down to the water's edge, cut the log loose from the twisting, clinging lianas holding it in a vice-like grip; and, using my pole as a lever, I pushed it off into the river, where it floated buoyantly and well. The current caught it in a moment, of course; but I had been expecting as much, and managed just to leap on to its nearer end as it drifted clear of the island. That the latter had only been brought to a standstill by running aground upon some submerged mass of driftage was clear the moment I had quitted it. The water was too deep to allow of my touching bottom with my pole, long though the latter was, and I found myself all but thrown into the jaws of the watching caymans the first time I tried to sound it. They were all around, biding their time; and one big fellow, as I saw by the sinister ripple in the water, actually followed in the wake of the log as I steered it across, using my pole as a rudder. But I was on my guard, and by taking care to shift my position on the log whenever I saw him coming too near, managed to thwart all his possible designs of knocking me off with a blow of his tail. None the less, the passage across was a pretty risky one, and I don't remember ever feeling more thankful in my life than when I ran the log aground, a good bit north of the spit of sand where the caymans were clustered so thickly, and leaped ashore.

With the river to guide me, I could not go very far astray, nor yet could I die of thirst. But I had to spend more than one night in the forest, with nothing to eat beyond a few wild fruits, and I knew pretty well what hunger meant before getting back to my Indians. They were uncommonly glad to see me, believing that I must either have been drowned in trying to cross the river or else killed

by a jaguar.

That happened a good many years ago, but the

incident is fresh in my memory still.

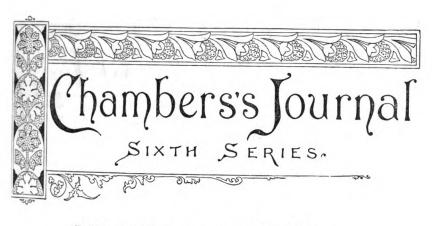

Ay, there is little doubt that of all the strange adventures I have gone through, of all the queer sights I have ever seen-and I've seen a pretty considerable few-that is the one I am least likely ever to forget: the fight to the death between those two giants of the reptile world, waged on that lonely island in the solitudes of the forest of the Amazon River.

'THE MASS OF THE DEAD LOVERS.' ST ANDREWS CATHEDRAL.

An organ pealing through the broken fane; The rustle of a passing throng; the low, Soft whispering of lips that long ago Were closed in death; the sweet incessant rain Of kisses gentle as the dew is shed, Methought I heard, or was it phantasy? No. Hark that smothered wail! God, can it be The Lovers' Mass, the trysting of the dead?

'Twas but the boom of waves upon the shore, The rustling of the wanton, withered leaves, The water dripping idly from the eaves, The sobbing of a zepyhr passing o'er The sedge, the lowing of the distant beeves Awakened by a night-bird's scream. No more!

NIL

THE GREYS AT WATERLOO.

REMINISCENCES OF THE LAST SURVIVOR OF THE FAMOUS CHARGE.

By E. BRUCE LOW, M.A.

INTRODUCTORY NOTE.

SERGEAST MAJOR DICKSON of the Scots Greys, from whose has many of the details of the battle of Waterloo here given vere obtained by members of his family, was the last who surved of those who fought in the regiment at Waterloo. He was a native of Paisley, born in the Revolution year of 1789. He enlisted at Glasgow in 1807 when barely eighteen, and remained in the service till 1834. At Waterloo he was espeni in Captain Vernor's troop, and his sabre and other regimentals bear evidence that his number was 57 of F troop. lle was promoted sergeant immediately after Waterloo for his errices, and took the place of Sergeant Charles Ewart, who motived a commission in the Fifth Veteran Regiment for the leave deed narrated here. On retiring from the Greys Sergeant Dickson joined the Fife Light Horse, and his long milence in Crail is fresh in the memory of many of the inlabitants, who recall the stir in the village which took place a ach ansiversary of Waterloo, when the veteran hoisted in fag and the school children were marched to his house a slate the village hero. John Dickson died at the age d linety on 16th July 1880, survived by three children and grandchildren. His army papers bear that during in series of twenty seven years in the Greys his character the tecellent,' and he was awarded a medal for long service nd god conduct, in addition to his Waterloo medal. He a typical yeoman—tall, of ruddy complexion, brown hir, and hazel eyes, as the army records tell us—and his description that the acres in East Lothian which their acceptors have held from Lord Wemyss for generations.

Tas Greys at the glorious Waterloo fight
Put ten thousand men of Count D'Erlon to flight;
Tam Eagle and banner by Ewart were won,
And the Dells o' Dundes proved they 're 'Second to None.'

-Old Regimental Song.

EATED within the coffee-room of the little Fifeshire inn, a merry party of villagers and visitors met in the summer evening to do honour to their veteran host or the summer and the summer evening to be summer evening to be summer to the summer evening to be sufficient to the summer evening to be sufficient to the summer evening to be sufficient to the summer even to be sufficient to the summer even to the summer even to be sufficient to the summer even to

their veteran host on the anniversary of Waterloo, in the year 1855. The water from the Crimea portended another great take upon Sebastopol, which in truth was taking No. 477.—Vol. X.

place at that very moment; and as the thoughts of the people were with their kinsmen in the trenches, the genial host, who was none other than Sergeant-Major Dickson, was induced to relate his experiences of forty years ago.

of forty years ago.

Taking his 'yard of clay' pipe in hand, he seated himself at the table, at the head of which sat the village banker; for, be it known, 'Waterloo Day' was a high day in the village, kept in ripe memory by the flags flying and the procession of school children, decked in summer attire and gay with flowers, to do honour to 'mine host,' whose deeds of valour were on every tongue. When the toddy-glasses had been filled it only required the keynote to be sounded by the inquiry of the president, 'By-the-by, sergeant, what might you be doing just at this time forty years ago?' to draw forth the great story of the charge of the Union Brigade. The sergeant smoked for a time in silence; then, with a far-away look in his eyes, he began:

'Well, you all know that when I was a lad of eighteen, being a good Scotsman, I joined the Greys, the oldest regiment of dragoons in the British army, and our only Scottish cavalry corps.

'When news came that Napoleon Bonaparte had landed in France, we were sent across to Belgium post-haste, and there had a long rest, waiting for his next move. I remember how the trumpets roused us at four o'clock on the morning of Friday the 16th June 1815, and how quickly we assembled and fell in!

'Three days' biscuits were served out to us; and after long marches—for we did fifty miles that one day before we reached Quatre Bras—we joined the rest of our brigade under Sir William Ponsonby.

'Besides our regiment, there were the First Royals and the Enniskillings, and we were known as the Union Brigade because, you see, it was made up of one English, one Irish, and one Scots regiment.

'On the day before the great fight—that was Saturday, for you know the battle was fought on s Reserved.]

JANUARY 19, 1907.

[All Rights Reserved.]

the Sunday morning, the 18th June-we were marched from Quatre Bras along the road towards Brussels. We thought our Iron Duke was taking us there; but no. In a drenching rain we were told to halt and lie down away in a hollow to the right of the main road, among some green barley. Yes, how we trampled down the corn! The wet barley soon soaked us, so we set about making fires beside a cross-road that ran along the hollow in which we were posted. No rations were served that night. As we sat round our fire we heard a loud, rumbling noise about a mile away, and this we knew must be the French artillery and wagons coming up. It went rolling on incessantly all night, rising and falling like that sound just now of the wind in the chimney.

'One thing I must tell you: though there were more than seventy thousand Frenchmen over there, we never once saw a camp-fire burning all the night and until six o'clock next morning. Why they weren't allowed to warm themselves, poor fellows! I don't know. Well, about eleven o'clock that night a fearful storm burst over us. The thunder was terrible to hear. It was a battle-royal of the elements, as if the whole clouds were going to fall on us. We said it was a warning to Bonaparte that all nature was angry at him.

'Around the fires we soon fell asleep, for we were all worn out with our long march in the sultry heat

of the day before.

'I was wakened about five o'clock by my comrade M'Gee, who sprang up and cried, "D- your eyes, boys, there's the bugle !" "Tuts, Jock !" I replied, "it's the horses' chains clanking." "Clankin'?" said he. "What's that, then?" as a clear blast fell on our ears.

'After I had eaten my ration of "stirabout"oatmeal and water-I was sent forward on picket to the road two hundred yards in front, to watch the enemy. It was daylight, and the sun was every now and again sending bright flashes of light through the broken clouds. As I stood behind the straggling hedge and low beech-trees that skirted the high banks of the sunken road on both sides, I could see the French army drawn up in heavy masses opposite me. They were only a mile from where I stood; but the distance seemed greater, for between us the mist still filled the hollows. There were great columns of infantry, and squadron after squadron of Cuirassiers, red Dragoons, brown Hussars, and green Lancers with little swallow-tail flags at the end of their lances. The grandest sight was a regiment of Cuirassiers dashing at full gallop over the brow of the hill opposite me, with the sun shining on their steel breastplates. It was a splendid show. Every now and then the sun lit up the whole country. No one who saw it could ever forget it.

Between eight and nine there was a sudden roll of drums along the whole of the enemy's line, and a burst of music from the bands of a hundred battalions came to me on the wind. I seemed to recognise the "Marseillaise," but the sounds got mixed and lost in a sudden uproar that arose.

Then every regiment began to move. They were taking up position for the battle. On our side perfect silence reigned; but I saw that with us too preparations were being made. Down below me a regiment of Germans was marching through the growing corn to the support of others who were in possession of a farmhouse that lay between the two armies. This was the farm of La Haye Sainte, and it was near there that the battle raged fiercest. These brave Germans! they died to a man before the French stormed it, at the point of the bayonet, in the afternoon. A battery of artillery now came dashing along the road in fine style and passed in front of me. I think they were Hanoverians; they were not British troops, but I don't remember whether they were Dutch or German. They drew up close by, about a hundred yards in front of the road. There were four guns. Then a strong brigade of Dutch and Belgians marched up with swinging, quick step, and turned off at a crossroad between high banks on to the plateau on the most exposed slope of our position. They numbered at least three thousand men, and looked well in their blue coats with orange-and-red facings. After this I rode up to a party of Highlanders under the command of Captain Ferrier, from Belsyde, Linlithgow, whom I knew to belong to the Ninetysecond, or "Gay Gordons," as we called them. All were intently watching the movements going on about them. They, with the Seventy-ninth Cameron Highlanders, the Forty-second (Black Watch), and First Royal Scots, formed part of Picton's, "Fighting Division." They began to tell me about the battle at Quatre Bras two days before, when every regiment in brave old Picton's division had lost more than one-third of its men. The Gordons, they said, had lost half their number and twentyfive out of thirty-six officers. Little did we think that before the sun set that night not thirty men of our own regiment would answer the roll-call.

'I seem to remember everything as if it happened yesterday. After the village clocks had struck eleven the guns on the French centre thundered out, and then musketry firing commenced away to the far right. The French were seen to be attacking a farmhouse there in force. It was called Hougomont. I noticed, just in front of me, great columns of infantry beginning to advance over the brow of the hill on their side of the valley, marching straight for us. Then began a tremendous cannonade from two hundred and fifty French guns all along the lines. The noise was fearful; but just then a loud report rent the air, followed by a rolling cheer on our side, and our artillery got into action. We had one hundred and fifty guns in all; but half of these belonged to the Dutch, Germans, or Belgians, who were hired to fight on our side. The French had about ten thousand men more than we had all that day, till, late in the afternoon, the Prussians arrived with forty thousand men to help us. I was now drawn back and joined our regiment, which was being moved forward to

the left under better cover near a wood, as the shot and shell were flying about us and ploughing up the earth around. We had hardly reached our position when a great fusillade commenced just in front of us, and we saw the Highlanders moving up towards the road to the right. Then, suddenly, a great noise of firing and hisses and shouting commenced, and the whole Belgian brigade, of those shom I had seen in the morning, came rushing along and across the road in full flight. Our men began to shout and groan at them too. They had bolted almost without firing a shot, and left the brigade of Highlanders to meet the whole French attack on the British left centre. It was thought that the Belgians were inclined towards Napoleon's cause, and this must account for their action, as they have shown high courage at other times.

immediately after this, the General of the Union Brigade, Sir William Ponsonby, came riding up to us on a small bay hack. I remember that ha groom with his chestnut charger could not be found Beside him was his aide-de-camp, De Lacy Euns He ordered us forward to within fifty rank of the beech-hedge by the roadside. I can se him now in his long cloak and great cocked hat as he rode up to watch the fighting below. from our new position we could descry the three regiments of Highlanders, only a thousand in all, barely firing down on the advancing masses of frenchmen. These numbered thousands, and those on our side of the Brussels road were divided into three solid columns. I have read since that there Tere fileen thousand of them under Count D'Erlon pread over the clover, barley, and rye fields in host of our centre, and making straight for us. Then I saw the Brigadier, Sir Denis Pack, turn to the Gordons and shout out with great energy, Ninety second, you must charge! All in front of a bave given way." The Highlanders, who had bean the day by solemnly chanting 'Scots wha hae' they prepared their morning meal, instantly, with ized bayoneta, began to press forward through the bach and holly hedge to a line of bushes that grew Lag the face of the slope in front. They uttered kai shouts as they ran forward and fired a volley t trenty yards into the French.

At this moment our General and his aide-de-camp risk off to the right by the side of the hedge; then risked for the right by the side of the hedge; then risked out, "Now then, Scots Greys, charge!" and, the side out, "Now then, Scots Greys, charge!" and, the side out, "Now then, Scots Greys, charge!" and, the sides in front, which he took in grand style. At each agreat cheer rose from our ranks, and we too tard our swords and followed him. I dug my sur into my brave old Rattler and we were off the state out, and the sur as a state our swords and followed him. I dug my sur into my brave old Rattler and we were off the state of the stat

uttering loud neighings and snortings, and leapt over the holly-hedge at a terrific speed. It was a grand sight to see the long line of giant grey horses dashing along with flowing manes and heads down, tearing up the turf about them as they went. The men in their red coats and tall bearskins were cheering loudly, and the trumpeters were sounding the "Charge." Beyond the first hedge the road was sunk between high, sloping banks, and it was a very difficult feat to descend without falling; but there were very few accidents, to our surprise.

"All of us were greatly excited, and began crying, "Hurrah, Ninety-second! Scotland for ever!" as we crossed the road. For we heard the Highland pipers playing among the smoke and firing below, and I plainly saw my old friend Pipe-Major Cameron standing apart on a hillock coolly playing "Johnny Cope, are ye waukin' yet?" in all the din.

'Our colonel went on before us, past our guns and down the slope, and we followed; we saw the Royals and Enniskillings clearing the road and hedges at full gallop away to the right.

Before me rode young Armour, our rough-rider from Mauchline (a near relative of Jean Armour, Robbie Burns's wife), and Sergeant Ewart on the right, at the end of the line beside our cornet, Kinchant. I rode in the second rank. As we tightened our grip to descend the hillside among the corn we could make out the feather bonnets of the Highlanders, and heard the officers crying out to them to wheel back by sections. A moment more and we were among them. Poor fellows! some of them had not time to get clear of us, and were knocked down. I remember one lad crying out, "Eh! but I didna think ye wad ha'e hurt me sae."

'They were all Gordons, and as we passed through them they shouted, "Go at them, the Greys! Scotland for ever!" My blood thrilled at this, and I clutched my sabre tighter. Many of the Highlanders grasped our stirrups, and in the fiercest excitement dashed with us into the fight. The French were uttering loud, discordant yells. Just then I saw the first Frenchman. A young officer of Fusiliers made a slash at me with his sword, but I parried it and broke his arm; the next second we were in the thick of them. We could not see five yards ahead for the smoke. I stuck close by Armour; Ewart was now in front.

'The French were fighting like tigers. Some of the wounded were firing at us as we passed; and poor Kinchant, who had spared one of these rascals, was himself shot by the officer he had spared. As we were sweeping down a steep slope on the top of them, they had to give way. Then those in front began to cry out for "quarter," throwing down their muskets and taking off their belts. The Gordons at this rushed in and drove the French to the rear. I was now in the front rank, for many of ours had fallen. It was here that Lieutenant Trotter, from Morton Hall, was killed by a French officer after the first rush on the French. We now came to an open space covered with bushes, and then I saw Ewart, with five or six infantry men about him,

Of Mardestone, Lanarkshire.

slashing right and left at them. Armour and I dashed up to these half-dozen Frenchmen, who were trying to escape with one of their standards. I cried to Armour to "Come on!" and we rode at them. Ewart had finished two of them, and was in the act of striking a third man, who held the Eagle; next moment I saw Ewart cut him down, and he fell dead. I was just in time to thwart a bayonet-thrust that was aimed at the gallant sergeant's neck. Armour finished another of them.'

Our host here pointed out to his little company of intent listeners a print of the well-known picture of the incident which hung on the wall, and of which he was very proud; then he continued:

'Almost single-handed, Ewart had captured the Imperial Eagle of the Forty-fifth "Invincibles," which had led them to victory at Austerlitz and Jena. Well did he merit the commission he received at the hands of the Prince Regent shortly afterwards, and the regiment has worn a French Eagle on our colours ever since.

"We cried out, "Well done, my boy!" and as others had come up, we spurred on in search of a like success. Here it was that we came upon two batteries of French guns which had been sent forward to support the infantry. They were now deserted by the gunners and had sunk deep in the mud.

'We were saluted with a sharp fire of musketry, and again found ourselves beset by thousands of Frenchmen. We had fallen upon a second column; they were also Fusiliers. Trumpeter Reeves of our troop, who rode by my side, sounded a "Rally," and our men came swarming up from all sides, some Enniskillings and Royals being amongst the number. We at once began a furious onslaught on this obstacle, and soon made an impression; the battalions seemed to open out for us to pass through, and so it happened that in five minutes we had cut our way through as many thousands of Frenchmen.

'We had now reached the bottom of the slope. There the ground was slippery with deep mud. Urging each other on, we dashed towards the batteries on the ridge above, which had worked such havoc on our ranks. The ground was very difficult, and especially where we crossed the edge of a ploughed field, so that our horses sank to the knees as we struggled on. My brave Rattler was becoming quite exhausted, but we dashed ever onwards.

'At this moment Colonel Hamilton rode up to us crying, "Charge! charge the guns!" and went off like the wind up the hill towards the terrible battery that had made such deadly work among the Highlanders. It was the last we saw of our colonel, poor fellow! His body was found with both arms cut off. His pockets had been rifled. I once heard Major Clarke tell how he saw him wounded among the guns of the great battery, going at full speed, with the bridle-reins between his teeth, after he had lost his hands.

'Then we got among the guns, and we had our revenge. Such slaughtering! We sabred the gunners, lamed the horses, and cut their traces and

harness. I can hear the Frenchmen yet crying "Diable!" when I struck at them, and the long-drawn hiss through their teeth as my sword went home. Fifteen of their guns could not be fired again that day. The artillery-drivers sat on their horses weeping aloud as we went among them; they were mere boys, we thought.

'Rattler lost her temper and bit and tore at everything that came in her way. She seemed to have got new strength. I had lost the plume of my bearskin just as we went through the second infantry column; a shot had carried it away. The French infantry were rushing past us in disorder on their way to the rear. Armour shouted to me to dismount, for old Rattler was badly wounded. I did so just in time, for she fell heavily the next second. I caught hold of a French officer's horse and sprang on her back and rode on.

'Then we saw a party of horsemen in front of us on the rising ground near a farmhouse. There was "the Little Corporal" himself, as his veterans called Bonaparte. It was not till next night, when our men had captured his guide, the Belgian La Coste, that we learned what the Emperor thought of us. On seeing us clear the second column and commence to attack his eighty guns on the centre, he cried out, "These terrible Greys, how they fight!" for you know that all our horses, dear old Rattler among them, fought that day as angrily as we did. I never saw horses become so ferocious, and woe betide the blue coats that came in their way! But the noble beasts were now exhausted and quite blown, so that I began to think it was time to get clear away to our own lines again.

'But you can imagine my astonishment when down below, on the very ground we had crossed, appeared at full gallop a couple of regiments of Cuirassiers on the right, and away to the left a regiment of Lancers. I shall never forget the sight. The Cuirassiers, in their sparkling steel breastplates and helmets, mounted on strong black horses, with great blue rugs across the croups, were galloping towards me, tearing up the earth as they went, the trumpets blowing wild notes in the midst of the discharges of grape and canister shot from the heights. Around me there was one continuous noise of clashing arms, shouting of men, neighing and moaning of horses. What were we to do? Behind us we saw masses of French infantry with tall fur hats coming up at the double, and between us and our lines these cavalry. There being no officers about, we saw nothing for it but to go straight at them and trust to Providence to get through. There were half-a-dozen of us Greys and about a dozen of the Royals and Enniskillings on the ridge. We all shouted, "Come on, lads; that's the road home!" and, dashing our spurs into our horses' sides, set off straight for the Lancers. But we had no chance. I saw the lances rise and fall for a moment, and Sam Tar, the leading man of ours, go down amid the flash of steel. I felt a sudden rage at this, for I knew the poor fellow

well; he was a corporal in our troop. The crash as we met was terrible; the horses began to rear and bite and neigh loudly, and then some of our men got down among their feet, and I saw them trying to ward off the lances with their hands. Cornet Starges of the Royals-he joined our regiment as lieutenant a few weeks after the battle-came up and was next me on the left, and Armour on the right. 'Stick together, lads!' we cried, and went at it with a will, slashing about us right and left over our horses' necks. The ground around us was very soft, and our horses could hardly drag their feet out of the clay. Here again I came to the ground, for a Lancer finished my new mount, and I thought I was done for. We were returning past the edge of the ploughed field, and then I saw a spectacle I shall never forget. There lay brave old Ponsonby, the General of our Union Brigade, beside his little bay, both dead. His long, furlined clock had blown aside, and at his hand I noticed a miniature of a lady and his watch; berond him, our Brigade-Major, Reignolds of the Greys. They had both been pierced by the Lancers a lew moments before we came up. Near them was ling a lieutenant of ours, Carruthers of Annandale. We heart filled with sorrow at this, but I dared not remain for a moment. It was just then I caught sight of a squadron of English Dragoons making straightfor The Frenchmen at that instant seemed to give way, and in a minute more we were safe! The Dragoons gave us acheer and rode on after the Lancers. They were the men of our Sixteenth Light Dragoons,* of Vandeleur's Brigade, who not only saved us but threw back the Lancers into the hollow.

How I reached our lines I can hardly say, for the bett thing I remember is that I was lying with the selermants of our brigade in a position far away to the right and rear of our first post. I was told that a third horse that I caught was so wounded that the fell dead as I was mounting her.

Wonderful to relate, Rattler had joined the mentating Greys, and was standing in line riderless

when I returned. You can imagine my joy at seeing her as she nervously rubbed shoulders with her neighbours. Major Cheney (who had five horses killed under him) was mustering our men, and with him were Lieutenant Wyndham † (afterwards our colonel) and Lieutenant Hamilton, 1 but they were both wounded. There were scarcely half a hundred of the Greys left out of the three hundred who rode off half-an-hour before. § How I escaped is a miracle, for I was through the thick of it all, and received only two slight wounds, one from a bayonet and the other from a lance, and the white plume of my bearskin was shot away. I did not think much of the wounds at the time, and did not report myself; but my poor Rattler had lost much blood from a lance-wound received in her last encounter.

'Every man felt that the honour of our land was at stake, and we remembered that the good name of our great Duke was entrusted to us too; but our main thought was, "What will they say of us at home?" It was not till afterwards that we soldiers learned what the Union Brigade had done that day, for a man in the fighting-ranks sees little beyond the sweep of his own sword. We had pierced three columns of fifteen thousand men, had captured two Imperial Eagles, and had stormed and rendered useless for a time more than forty of the enemy's Besides, we had taken nearly three thousand prisoners, and, when utterly exhausted, had fought our way home through several regiments of fresh cavalry. That, my friends, is why, from the Prince Regent to the poorest peasant, from the palace to the lowliest cottage, the name of the Union Brigade was honoured throughout

When the sergeant had finished his story the toddy had cooled in the tumblers; but there was time to fill them and drink 'Long life to the Sergeant' and to the Union Brigade of our own time, whose charge on Balaklava Day proved that they were worthy successors of the Heroes of Waterloo.

THE LORD OF THE MANOR.

CHAPTER IX.

was a pregnant saying of May Castlerayne's that her father must have been born with the artistic temperament, he had so little knowledge of the value of money and so

sines have suffered from the same amenable watness. But we have it on record that even so sometic of carking anxiety, not lessened by the wantest that his misfortunes were entirely of his Rape Castlern.

Rayne Castlerayne was much in this position.

*Under Colonel James Hay, afterwards Colonel-in-Chief

the Seventy-ninth Cameron Highlanders.

It was gradually coming home to him that there was only one way out of the *impasse*. He looked very old and haggard as he sat at his desk in the library turning over a number of papers. It had quite suddenly come home to him that not only had he no money, but that he had no means of raising money. There was a polite but firm note

‡ Son and heir of General John Hamilton of Dalsell, Lanarkshire, and father of Lord Hamilton.

§ We lost sixteen officers out of twenty-four on the field.

[†] Colonel Wyndham was the last survivor among the Greys' officers, and Sergeant-Major Dickson attended his funeral in 1872 in the Tower of London, where he had been the Keeper of the Crown Jewels for twenty years.

from his bankers refusing to honour any further cheques; here were numerous applications for payment of accounts; and here, also, was a letter from the family lawyer couched in the plainest and most unpleasant terms. Mr Summers had not minced matters. He pointed out the fact that something would have to be done to meet certain pressing claims, or the annoyances would be serious indeed. Mr Summers further intimated that he would come over after luncheon and discuss the situation with his client.

Rayne Castlerayne was almost ready to admit that he had been to blame. When he had taken possession of the property five-and-twenty years ago the income of the estate had been a little over fifteen hundred pounds a year. Where had it all gone to? It was quite impossible for the head of the family to say. He had lost certain good opportunities of making the condition of things better. For instance, there were those five thousand odd acres of land between the sea and the Common. The land was grandly picturesque, the air bracing and rigorous, but the crop was mainly blackberries and bracken. Twenty years ago a big speculative firm had offered Mr Castlerayne a fancy price for the land with an eye to the formation of an exclusive watering-place. The offer had been rejected with scorn. Castlerayne began to wish that he had not been quite so precipitate. Greater men than himself had taken such golden opportunities; he could call to mind a score of members of the peerage who sold a deal of their property to popular watering-places.

Perhaps it would be possible to let The Towers and go abroad. He could not sell the house, for it formed the very last portion of the Castlerayne settled estates. The land beyond the Common was his to do with as he pleased, but nobody would buy it; the poor soil was good for nothing. And it would be difficult at this time of day to try to compete with prosperous Hardborough close by.

Castlerayne's meditation was bitter enough, and his cigar lacked flavour as he faced these stern facts. He welcomed the advent of his solicitor with effusion. It seemed to relieve him of a part of his responsibility. And Summers was a clever fellow; he would be pretty sure to find some way out of the difficulty. It sounded vague, but the typical Micawber-like attitude was essentially a Castlerayne attribute. The family solicitor sat down and wiped his gold-rimmed glasses. With his erect figure, his keen eyes, and his well-trimmed gray moustache, he looked not unlike 'the county' himself.

'Glad you've come, Summera,' Castlerayne said

'Glad you've come, Summers,' Castlerayne said with a sigh. 'I've been going over those papers till my head aches. Have a cigar? I forgot you don't smoke till after dinner. What's all this about Foster? As far as I can judge, it seems to me that Foster has been behaving very badly.'

'Foster naturally wants his money. He is in difficulties himself. Really, my friend, it isn't a nice thing for you to owe Foster fifty pounds. He is a very hard-working fellow, with a big family. He put you in the county court. You simply let the matter slide, and he issued what is called a judgment summons. So far as I can understand, you let that slide also. If you had not been Mr Castlerayne of The Towers you would have found yourself in an awkward position—a very awkward position. A judgment debtor is expected to come before the judge periodically and be examined as to his ability to pay. If the judge is satisfied that the debtor is telling the truth, he makes an order for so much per month. You ignored the matter altogether, and you were ordered to pay the full amount within eight days. If the money is not paid by Friday you will go to jail.

The choice cigar dropped from Castlerayne's mouth and lay unheeded on the floor. The blood receded from his face, leaving it ghastly white. The statement was stupendous, incredible! It seemed impossible that such things should be permitted in a civilised country. And the day

after to-morrow was Friday!

'Is—is this true?' Castlerayne stammered. 'But it must be true. I never heard you joke, Summers. And my bank people refuse to cash any more cheques for me. I tell you, I haven't a five-pound note in the world. Anyway, I'll get

you to pay this for me.'

'No,' Summers said firmly, 'I think not. I'm not justified in doing it, Castlerayne. It's not fair to my family, with two boys at Cambridge. You will probably be surprised to hear that you owe me five hundred pounds one way and another, and that nearly half of it is money out of my pocket. That is why I came to see you to-day. I advised you very strongly not to fight Craggs's action, but you would not listen. To-day I accepted service of a writ from Craggs's solicitors for over eleven hundred pounds costs in the action. In a week's time they can levy execution.'

Castlerayne wiped the damp from his forehead. He seemed to have aged strangely in the last hour or two since he had the courage to face his position. He picked up the fallen cigar, but he did not place it in his lips again. There was a queer pain in his left side, a twitching of the arm,

that he had never felt before.

'Will you put that quite plainly, please?' he whispered.

'I thought I had. Cragge's solicitors can come here and take everything. They can sell your pictures and your plate and your old furniture to pay their claim. There is only one way by which you can prevent the inevitable.'

'Go on, Summers. I begin to understand things more clearly. I seem to have been living in a kind of fool's paradise all these years. It is a kind of hideous dream. Only a day or two ago I was Castlerayne of The Towers; to-day I am a pauper. If I can't find this money by Friday I go to jail; if I don't pay Craggs's solicitors I lose my home. If there is any possible way out of the mess'—

'Well, there is no way out of the mess,' Summers went on coldly and judicially. 'The utmost you can do is to save yourself from unpleasant exhibition. Bankruptcy wipes out everything of that kind. If you put your petition in bankruptcy, Foster can't touch you. You will be spared the midgaity of having the bailiffs and sheriffs officers in passession of The Towers. But everything will have to be sold for the benefit of the creditors. My dear old friend, I am exceedingly sorry, far more sorry than I can say; but there is absolutely no other way to save you.'

So it was coming at last, the very thing that the head of the family had so absolutely refused to look squarely in the face. There had been no disgrace in the steady robbing of poor tradesmen, no continuely in those imposed bills; but bankruptcy was another matter altogether. It meant exposure, and awkward questions by a cold official who had no respect for the Castlerayne dignity. It meant the resignation of exclusive clubs, the loss of the Commission of the Peace. It was so sordid and vulgar.

Wait a moment,' Castlerayne groaned. 'My bad has all gone queer. I can't think. It will to a terrible thing for my family, Summers.'

Of course it will. But, after all, it will be no more than people have been expecting for years. There is enough here to pay every body, and perhaps save a little over. There would not be the slightest toule in letting The Towers for three hundred a tear, and you could all live on that money. You might be worse off.'

But Castlerayne refused to be comforted. He was fond of his home, and proud of it. He fully appreciated the artistic beauties of his pictures; the degant simplicity of the old furniture was absolutely essential to him. And ruthless hands would demote him of all this in a few days' time. He felt multided and humiliated, ready to ask favours of lose whom he had hitherto patronised.

I cant decide anything now,' he groaned.

Really I can't, Summera. Give me a day to think it over. I don't want to be rude, but I should like to be alone for a time. I'll come and see you to morrow afternoon.'

Summers took the hint and departed. For a long time Castlerayne sat with his head on his land, moved for once to the depths of his soul.

Presently he could see the sun shining through the stained glass of the windows; he noted the light as it lingered on a Romney and caught the corner of a Louis XVI. commode. That Persian carpet had been on the floor for the best part of a century. How fresh the colours were!

Perhaps it was possible to do something yet. Foster might be paid. No doubt Gertrude would not mind advancing the money for that purpose. It was hard upon Gertrude, who had found so much out of her slender portion lately; but still—

Aunt Gertrude was in the still-room putting up some early damson-jam. Her slender figure was covered with a long white apron. The air was heavy with the rich aroma of fruit. Miss Castlerayne's face grew a little anxious as she noted her brother's expression. He paced up and down the room. He was showing none of his usual optimistic reticence now.

'I'm going to see Craggs,' he said. 'In his heart, Craggs is by no means a bad fellow. That fellow Foster is quite different. Foster must be paid and his account closed. In no circumstances could I ever consent to deal with him again.'

Castlerayne spoke quite firmly. There was no animosity in his voice—nothing but pleasing determination. Aunt Gertrude looked a little anxious.

'That is all very well,' she said; 'but who is going to pay him?'

'Well, it occurred to me that you would oblige. It is only a matter of fifty pounds. As a loving sister, you could not for a moment contemplate the alternative. Therefore, I shall look to you to see that this claim of Foster's is satisfied.'

'I'm afraid that it is quite impossible,' Aunt Gertrude faltered. She had grown very pale; her lips were white and drawn. 'It is not that I will not do it, Rayne; it is simply because I can't. I haven't the money. I—I had one or two claims to settle. At the present moment I have certainly not more than five pounds to my credit at the bank. Oh Rayne, if you only knew how it hurts me to tell you this; if only'—

'But there—there are other things. Part of your mother's jewellery, which I understood'——

'Oh Rayne, Rayne, they are gone too! What a wicked woman I am!'

(To be continued.)

CONCERNING OPIUM.

By ALGERNON WARREN.

H! ho! ho! You goo into druggist's shop o' market days, into Cambridge, and you'll see the little boxes, doozens and doozens, a' ready on the counter; and never a ven-man's wife goo by but what

ven.man's wife goo by but what the reck!

So wrote Charles Kingsley in 1849, in his once well-known novel Allon Locks, and there is no reason to think that he exaggerated the facts. But twenty years later 'pennords o' elevation'—otherwise penny pills of opium—were no longer obtainable so readily, thanks to the enforcement of the provisions of the Pharmacy Act of 1868, whereby the sale of opium and its preparations became

restricted to the hands of qualified pharmacists, and the public could purchase these commodities only if specially sanctioned to do so. At the same time it must be admitted that opium, particularly in the form of laudanum-that is, tincture of opium-is still to be met with sometimes in quarters where it cannot be surmised that it has been straightforwardly obtained by doctor's orders. 'Like a drop of laudanum in your tea, my dear?' was, to the writer's certain knowledge, a common invitation of the poorer classes in certain districts in Gloucestershire not a dozen years ago. 'I remember,' said a Bristol drug-vendor, 'how a countryman came and ordered half a drachm of opium from me. I weighed it out, wrapped it up, and passed it over to him. He just opened the paper and swallowed the contents straight off. I ran round the counter and caught him by the collar. "Oh," he said, "it's all right, master." It seems that he was used to taking it, but the quantity would have killed nine men out of ten as dead as herrings.' The regulation dose of opium figuring in the British Pharmacopæia is half a grain to two grains. This man swallowed thirty without evil effect.

Although-owing to its being so extensively prescribed for the relief of toothache and other pains-many are tolerably familiar with the appearance of tincture of opium, comparatively few have accurate knowledge as to what opium really is; and when they turn to a dictionary, and glean therefrom that it is the 'inspissated juice of the somniferous poppy,' they are still likely to be in the dark as to what portion of the poppy-plant yields the product in question. Where space is available the definition can be rendered in simpler language, such as: opium is solidified juice obtained by cutting the unripe heads or seed-vessels of a species of poppy extensively cultivated for the The process of purpose in Asiatic provinces. obtaining it is systematically to score the pods at fixed intervals during a certain period. The milky liquid which comes out soon turns to a darker hue, and thickens, and is then scraped off and moulded into cakes, with poppy-leaves for an outside covering.

This method of obtaining opium has been practised for some centuries. It attracted the notice of William Finch, a merchant connected with the London East India Company, who visited Surat with Captain Hawkins in 1608, and passed through Malwa in the course of a journey across India from Surat to Agra. He writes: 'This country is called Malwa, a fertile soile abounding with opium. . . I enquired the price of opium. They gave the head three scratches, from whence issue small teares, at the first white, which with the cold of the night turneth reddish, which they daily scrape, not without infinite trouble, the head being very small and yielding little.'

On the authority of Mr R. M. Dane, of the India Civil Service, opium and its uses were well known to the Greeks at least as early as the first cen-

tury A.D., and it is supposed that a knowledge of the drug was communicated by the Greeks to the Arabs, who afterwards introduced it into China and India. In a Chinese medical work commenced in 973 A.D., medicinal properties are attributed to the seeds of the poppy, and various Chinese writers of the twelfth and thirteenth centuries speak of the use of the poppy capsules in treatment of dysentory and other ailments

tery and other ailments. In India the history of opium is very obscure prior to the beginning of the sixteenth century, when many European travellers began to take note of the article there. The Portuguese and Dutch trafficked in Indian opium with the Chinese long before the British. The famous Dutch traveller Jan Huighen van Linschoten, writing about 1596, says: 'Amfion, so called by the Portingales, is by the Arabians, Mores [Moors], and Indians called affion, in Latin opio or opium. . . . Amfion is made of sleepe balls or poppie, and is the gumme which cometh forth of the same, to ye which end it is cut up and opened. The Indians used much to eat amfion, specially Malabares, and thither it is brought by those of Cambaia and other places in great abundance. He that useth to eate it must eate it daylie, otherwise he dieth and consumeth himself. When they begin to eate it, and are used unto it, they eate at the least twenty or thirty grains in weight every day, sometimes more; but if four or five days he chanceth to leave it, he dieth without fail. Likewise, he that hath never eaten it and will venture at the first to eat as much as those that daylie use it, it will surely kill him, for I certainly believe it is a kind of poyson.'

Latter-day experience confirms some parts of this writer's statements and rejects others. Ît was ascertained from evidence afforded to the Indian Opium Commission of 1895 that in some states of India not a few of the natives took as much as forty to eighty grains of opium per day, and that consumption of forty grains daily was common. But it has been evidenced that when confirmed opium-eaters have been imprisoned for a while, and thereby deprived temporarily of their favourite drug, their health has not usually suffered in consequence. So this Dutchman's information that death must inevitably occur from sudden cessation of the habit of opium-eating was grossly erroneous. On the other hand, he was perfectly right in assuming that a habituated consumer could eat with impunity a quantity which might at once prove fatal to one unaccustomed to taking opium.

The article has a variable effect on different races and constitutions, exciting some and stupefying others. It reduces the average Chinaman to a state of torpor if he take it plentifully, and not infrequently causes the Malay to run amuck. It has been recorded by writers of the Stuart period that the Javanese regularly took it before going to fight, so as to work themselves up to a pitch of excitement. Medical authorities, on the whole, though there is considerable difference of opinion on the

point, are disposed to look upon opium as a prevenive against malarial affections; and as India and China alike contain vast tracts where malaria is rile, it is only natural that its use should be prevalent there. In England, the diminution of its consumption in Cambridgeshire, Lincolnshire, and the Romney Marshes is owing mainly to the draining in these localities, and also to the reduced price of quinine, which consequently became more available to the working-classes as a remedy in ague and malarial fevers.

Most of the opium which is imported into Great Britain is termed 'best Turkey.' This comes from Asia Minor, and is largely shipped from Smyrna. It is ordinarily sent over in chests containing from one and a quarter to one and a half hundredweight each, chiefly in the form of different-sized cakes, seldom weighing less than half a pound and usually not exceeding three pounds. The quality of these, however, is apt to vary to such an extent that the contents do not give satisfaction if sold as of one uniform quality. The writer has seen chests opened in which some of the cakes were hard and dry, and others soft and 'cheesy' owing to the exuded opium having been exposed unequally to the rays of the sun prior to undergoing the scraping-off process. The undue exposure also has the effect of turning it black, whereas the natural colour of opium inclines more to brownish-yellow.

It should be borne in mind that most of the drug that is imported into England is far more powerful than what is ordinarily consumed in India and imported into China. The stipulation of the British Pharmacopeia is that all opium used medicinally stall yield at least 9½ per cent. of anhydrous morphine. The morphia percentage in much of the opium prepared in India for consumption there and exportation to China is less than half this specified strength. This is a detail which those towelists who are addicted to poisoning their character would do well to note.

It is rather striking that, whereas in the United aingiom circumstantial evidence has been forthcoming that restriction of sale of poisons has been deterrent as regards self-destruction, it does at appear from official statistics that opium is argely resorted to in India as a means of suicide. The evidence of the actuary of the largest insurance company in India doing business in native and European lives was to the effect that after twenty tan experience the company had decided that Tas not necessary to impose any extra premium on the lives of moderate opium consumers. The difference in the use of opium in India and China that in the former country it is commonly eten, while in the latter it is chiefly smoked. Aithough some proportion of the natives of India hay be said to be addicted to opium-smoking, is generally regarded there as a disreputable bit, because it is associated with laziness, whereas the eating of opium is indulged in largely as a beam to an end—namely, the keeping of the body

in a sound working condition. Several members of the Indian Medical Service, in support of their allegations that opium was extensively resorted to as a stimulant in physical emergencies, cited that thousands of natives in the Punjab abstained from opium-eating during about threequarters of the year, only taking to it in the winter months. The Rajputs customarily eat opium at betrothal ceremonies, and the practice of drinking kusumbha (opium solution) at betrothals, marriages, and funerals alike is common in some of the native states. In the Punjab the seed-vessel itself is infused in water, and the liquor drunk by those who are unable to afford prepared opium. This beverage is called post. The preparation of opium for Chinese smoking is termed chandu, and that used in India madak. The former is made by boiling down the strained solution of opium to a thick consistence. For madak, the crude opium is dissolved in water, and, after boiling, the solution is strained through a cloth and then boiled to a syrup and mixed with charred leaves of acacia, betel, or guava. When it has been moulded into a soft mass it is divided into balls like small marbles.

The chandu pipe is peculiarly constructed, the stem being of bamboo, about twenty inches long and more than an inch thick, with one end closed and the other shaped into a mouthpiece with large orifice. There is a round hole about seven inches from the closed end to accommodate the neck of the bowl, which is usually made of terracotta. The whole presents a very different appearance from that of an ordinary tobacco-pipe.

The following description of the chandu smoker figures in the Report of the Royal Commission of 1895: 'Armed with a pointed probe or style, he dips the point into his supply of chandu and takes up a suitable quantity, which forms a little drop at the point of the style. This he now carefully heats over the flame of a lamp until it dries up into a soft pilule. He next transfers the little pilule to the shallow cup on the upper surface of the bowl. Then, assuming a reclining position, he cautiously applies the pilule to the flame of the lamp, and at the right moment, when the chandu begins to bubble and emit smoke, he takes a full inspiration, and fills his lungs with smoke, and then slowly discharges it. One or two such inspirations exhaust the charge. A practised smoker will smoke fifteen or twenty pipes at one sitting.'

Those who desire a succinct description of an Indian opium factory may be recommended to read what Mr Rudyard Kipling has to say about the one at Ghazipur in The City of Dreadful Night, for therein the processes of opium quality-testing and weight-checking are detailed in the simplest language, as is also the necessary Government surveillance for the protection of revenue.

Said a doctor in the writer's hearing more than twenty years ago: 'If we were allowed to

choose two things only to prescribe, these would be opium and calomel.' The latter article is not now generally ordered in such large doses as it used to be. Early in the nineteenth century the recognised dose was just double what is usually prescribed now. But, although actual opium-eating has declined in the United Kingdom, there seems to be greater call than ever for narcotics; and within the last quarter of a century the British demand for morphia has greatly increased, and, sad to say, the habit of injecting it hypodermically has grown to a serious extent; and when people get into the way of doing this systematically it is surprising how much they can absorb into their system. A pharmacist, commenting recently upon this, said : 'A lady customer who had to my knowledge been using this drug for the past twenty years has recently died, and the doctor who was called in to attend her did not know that she was in the habit of taking morphia, and therefore was surprised when he heard of the quantity she had used from time to time.' Of late years, too, there has been a material use of the opium alkaloid-codeina or codeine, as it is otherwise called-which is now preferred to morphia for certain treatment on account of its different after-effect. Various newly discovered coal-tar by-products also have found favour as hypnotics with the medical fraternity on similar grounds, special stress by some of their advocates being laid on the fact that they do not incline, like morphia, to benumb the breathing-powers or the action of the heart. But opium is never likely to be supplanted, as its uses are so manifold both internally and externally. Countless sufferers from neuralgia, sciatica, lumbago, or rheumatism have reason to bless the relief obtained by the outward application of its preparations.

Reference must be made, in conclusion, to the drastic anti-opium decree ordered last autumn to be put into force in China, which affects about one hundred and fifty millions of people who use the drug more or less, and is one of the most remarkable documents ever issued. Not only the cultivation of the poppy but the use of opium, as well as its importation, must cease in ten years. The 30 or 40 per cent. of the Chinese who use opium must be registered, as well as the amount consumed, and no one can buy opium unless he is registered. No one will be permitted to begin the use of opium after the issue of these regulations. Those above sixty years of age using it are leniently treated, but must decrease their consumpt by 20 per cent. per annum. Shops selling opium will be gradually closed, and all opium-dens where opium is smoked will be compulsorily closed within six months. Neither wine-shops nor inns can allow smoking on the premises. Anti-opium societies are being founded to assist in its discontinuance. The manufacture of morphia in China is also prohibited, whether by Chinese or foreigners.

SLIOCH'S TREASURE.

CHAPTER IV.

EXT morning, after breakfast, Captain Corbett was signalled for, and soon joined us in the library, where I am afraid Jack and I talked more than was becoming or sensible.

The first thing to be done was evidently to explore the shore of the loch opposite the wreck, and Jack and I immediately proposed that we should walk down the lochside. Commander Hardy, however, reminded us that the access to the spot where the treasure lay must be supposed to be from the sea, and after a minute or two's thought, turned to Captain Corbett and asked, 'When is low-water to-day?'

'At about three o'clock,' replied the captain; 'and it ought to be a very low tide indeed, for not only are the spring-tides about their height just now, but the gale of Sunday must have driven an unusual quantity of water out of the loch.'

"So much the better,' said Commander Hardy.
"Now, what I suggest, Admiral, is that we who are here start on a fishing expedition after lunch. We don't need to proclaim what we are going to fish for, you know."

'A capital idea!' assented the Admiral. 'You

make the necessary arrangements, captain, and we will meet you at the pier at two o'clock.'

Commander Hardy interested me much by occupying the forenoon in making a large 'water-telescope' and testing a portable electric reading-lamp (then quite a novelty), the electricity for which was generated in a case like a large cigar-box. For this case he made a cover of stout canvas, having straps attached to each of the corners; and taking the lamp from the stand, he mounted it on a cap with ear-flaps. I asked him the meaning of his preparations; but laughingly saying I should see in good time, he sent me off to procure a long length of half-inch rope. This I brought him, and with great care he attached it to a broad leather belt.

By this time lunch was ready, and, believe me, there was no lingering over it. At ten minutes before two we were down at the pier, where Captain Corbett, no less eager to be off than we were, was waiting with a boat. He looked hard at Commander Hardy as the water-telescope and electric lamp and rope were carefully placed in the boat; but, whatever curiosity he may have felt about our equipment, he gave no audible expression

to it. Jack took one oar, I the other, and, with the Admiral steering, we made for the site of the wreck. Commander Hardy smilingly remarked that it was fortunate the sea was so dead-calm and the sun so bright; and when I added sarcastically, 'Fine fishing weather, I suppose,' he laughed outright. Little did I think what his reason was for being so pleased with the weather.

You may be sure Jack and I did not spare ourselves, and before long the Admiral referred from time to time to the chart on which he had pricked the situation of the wreck.

'Way enough! Lay on your oars!' he suddenly eried, and after a little manœuvring we were floating stationary right above the spot where the anchor of the yacht was fast. After carefully verifying our position, the Admiral directed us to pull gently anight for the shore. As we did so, I gazed over my shoulder and saw that we were approaching a miniature bay shaped out by high rocks in the form of a horseshoe, but with the seaward ends curving in and almost overlapping. The mountain derended in an apparently unbroken slope of grass till it met a cliff about eleven feet high, which in its turn descended smooth and straight into the

The horns of the bay, somewhat lower than the cliff, and fantastically fashioned, served completely to hide the bay from any point of view not directly in a line with the spot where we had located the wreck. Cautiously we paddled the boat between the projecting points, and stopped her way are found ourselves floating in a basin of pellucid vater just large enough to contain the boat easily. for some minutes all hands eagerly scanned the cliff and surrounding rocks for some indication of a place of concealment, but altogether in vain. Finally turning towards Commander Hardy with a disappointment I felt he more than any one must keenly stare, I became more puzzled than ever. So far a lould see his face, it most certainly bore no tace of our being baffled. He was leaning over the beat's side, gazing intently downwards through he newly made water-telescope, and as I watched him his lips parted with a smile. When he at last okel up there was a jubilant ring in his voice he said to the Admiral, 'Look down through the contrivance of mine along the bed of the loch, just where the sandy bottom joins the cliff."

The Admiral did so, and handing the tube to the captain, said, 'Take a look; it really makes ererthing wonderfully clear. I had no idea any ingrament could enable one to see so well under Take. You can easily satisfy yourself there's nothing to be found there.

The captain solemnly set to work, and slowly followed the line of the rocks with the telescope. All at once his eye seemed to be caught by something. His body became rigid. As he stood axionless and intent, the secrets of the sea speared to be his, and we all waited breathbady for his revelation. When at length he moved, the face he turned to Commander Hardy was that of a man incredulously contemplating a newly suggested solution of a problem long deemed insoluble, and he said emphatically:

'There's a small but regularly formed tunnel opposite us, running apparently right into the mountain. That may have been the entrance to where Slioch concealed his treasure; but I'll swear no ebb-tide in our day ever left it uncovered. No'and he looked hard at Commander Hardy-' no, nor has it ever been dry since the Almighty made seawater.'

'Quite so,' said Commander Hardy, with a confidential nod. 'Now, hand the tube round, and then we'll have a consultation.'

After we had all seen the entrance to the tunnel, and so far satisfied our curiosity, Commander Hardy, with a twinkle in his eye, asked the Admiral what he made of it.

'Now, that's too bad, Hardy. Don't keep us in suspense. You know I never guessed a conundrum in my life. Out with it at once.

'Just one moment, Admiral,' replied Commander Hardy. 'I should like first to hear what Captain Corbett thinks.—Captain, what do you make of it?'

'Well,' said the captain slowly, speaking as if thinking aloud, 'I'm not for denying that this is opposite the wreck of the yawl. No, nor that it's an opening into land—and more, an opening a fish could swim into; but what farther forward that takes you fairly beats me.'

'Exactly,' returned Commander Hardy. 'The situation of the tunnel is exactly opposite the wreck; the tunnel is filled with water, and so can only be entered by swimming; and it must end inside the mountain, or, in other words, on land. And,' he added impressively, 'I believe, on dry land. At any rate, what I propose to do is to go in and see.'

'Go and see!' interrupted the Admiral excitedly. 'Go and see! Don't talk rot, man. Go and see! Why, it's sheer lunacy. It's like a lunatic to imagine himself a fish!'

'No, Admiral,' quietly retorted Commander Hardy, 'I'm not a lunatic, though I do believe that in some respects I'm more like a fish than most people. Seriously, you know, I can remain under water for two minutes easily enough. The entrance to the tunnel is within a few feet of us. What is to hinder me from exploring, at all events, a portion of it? Nothing. And what's more, with your permission, I'm going to try. Now you see why I brought your electric lamp and the rope. I can see the place with the lamp fastened to my forehead, and if anything unexpected happens you can pull me back with the rope.

A curious silence fell upon us all as Commander Hardy commenced his preparations. He stripped, with the exception of his boots, tied the flaps of the shooting-cap (to which the electric lamp was fixed) under his chin, slung the generator on his back, then buckled the belt at the end of the rope

round his chest. Handing the rope to Captain Corbett, he said, 'Hold it so that it will run clear when I dive; and if at the end of two minutes I have not returned or signalled that I am safe, pull me back to the boat. If before the two minutes are out I tug the rope once, pull it in slowly. If I tug it three times you will know that I'm safe, in which case leave the rope slack.'

Turning to the Admiral, he asked, 'Will that do?' and getting an affirmative nod (for the Admiral was past speaking for the moment), he told me to time him, and dived down from the side of the boat.

Never before, surely, did the second-hand of a watch tick out the passing moments more slowly. To my fascinated eye the marks on the dial seemed to present barriers to the passage of the hand, at which it was for ever sticking, and by the end of the first minute I was ready to shout out. Would another minute ever pass? Tick! Tick! Tick! I could count a hundred between each. minute and a half-or was it an hour and a half ?gone, and my lips were opening with the cry of 'Time's up' when Commander Hardy bobbed up at my side, gasping truly like a fish out of water. We helped him into the boat; but, alas! it was not difficult to guess from his disappointed look that at all events he had not found the treasure. As he rubbed himself dry we eagerly listened to him.

'I had no difficulty,' he reported, 'in swimming the entire length of the tunnel. It is apparently a natural one, extending in a straight line about forty feet into the rock. I searched the end as fully as time permitted, but could not discern any trace of a cave or hiding-place of any description. The main tunnel, so far as I could see, is simply a blind under-water channel, without any vestige of a hidingplace about it. The main tunnel, I say, is as I have described it; but it is possible that there may be a branch off it which I had not time to explore. I spent most of my time examining the end of the tunnel, and so had to come back rather hurriedly; but as I returned I caught a glimpse of a recess on the left-hand side of the tunnel and close to its mouth which may or may not lead somewhere. At all events, I propose to go down again in a few minutes and endeavour to find out.'

The Admiral tried to dissuade Commander Hardy from again venturing into the tunnel; but the Commander assured him that there was really no danger, and pointed out that it might be difficult to find another day so suitable for the exploration while he was in the north. At last the Admiral agreed to one other descent being tried; and after a repetition of his former instructions, Commander Hardy again dived below. This time I had little hope of our being on the track of the treasure, and noted the time with but little of my former excitement.

Barely a hundred seconds had elapsed, however, when Captain Corbett shouted out suddenly, 'Three tugs! Three tugs! By ——, he's found

the cave! How could he be safe otherwise? Them three tugs means he's safe. Blow me if I ever saw his like!' and taking off his cap, he waved it excitedly.

'Try him with three tugs in reply,' called out the Admiral; and at once three answering tugs completed our assurance that all was meantime right. The signals, repeated at intervals, kept down our anxiety, but did nothing to allay our excitement.

Five minutes, ten minutes passed, and it was all we could do to refrain from incontinently hauling in the rope to compel Commander Hardy's return. We all talked disjointedly at once, and the wildest surmises seemed for the moment easy to believe. The strain was rapidly becoming intolerable, when, with the shout, 'He's coming!' the captain dropped the rope and sat shaking on the thwart. A second after, Commander Hardy appeared at the side of the boat, and was hoisted in with a lack of ceremony to which his shins testified for some days. He was not in the least out of breath, and at once exclaimed, 'Yes, my boys! I've found old Slioch's hiding-place, though what the treasure may be we've yet to ascertain. I've seen a store of some kind, and only hope all the stuff's like this;' and, untying his cap, he produced six ancient golden guineas. 'Here! there's one for each of you; and here, Admiral, is one for your wife.'

We eagerly examined the coins, which were tarnished, it is true, but undoubtedly gold; and I'm sure there was not one of us who did not feel, as he rubbed his coin, something of a fellow-feeling for old Slioch.

'Now, Admiral,' continued Commander Hardy, 'I'm going to dress, for I don't propose going down again to-day. As we pull back I'll give you an account of my adventures, and we can talk over what we shall do to-morrow.'

It was, you may well believe, with no little reluctance that we turned to leave the precious spot; nor was the progress homeward steady or swift as Jack and I hung on Commander Hardy's words.

'When I entered the tunnel the second time I found that a stroke took me to the recess I had caught a glimpse of as I came out from my first attempt. It proved to be an oblong opening in the wall of the tunnel about the size of an ordinary door. I turned at once into the recess, and after a couple of strokes I seemed to pierce through the side of the tunnel and emerge into a large basin of water. I rose to the surface and cautiously, very cautiously, sniffed the air. It was quite sweet and fresh; and making sure that the rope was all right, so that I should have no difficulty in finding the exit again, I slowly swam forward in the direction of a faint light—or rather a less dense darkness which appeared near. I had taken about a dozen strokes when my feet struck what felt like sand, and a few careful steps took me up out of the water. Standing on its brink, I saw by the aid of the lamp that my feet were on a smooth, shelving beach of fine sand running back for a farther distance than

I could see. It was then that I signalled you that I was safe; and after getting your response and repeating my signal, I proceeded to explore the place to far as was possible in a short time and with limited light. I appeared to be in a natural cave, eighty or ninety feet broad and very high, extending back into the mountain. The floor was of fine and periectly dry sand, in which, as I walked slowly inwards, my feet sank. Presently I reached a great boulder or mass of rock, about, I should say, forty leet square, rising straight out of the sand to a height of ten or twelve feet. The top seemed level, and on it lay a number of what looked like ancient sea-chests. The sides of the boulder were smooth and perpendicular, and it was manifestly imposable for me to reach the top without assistance of some kind. On reaching the back of the boulder, there on the sand lay what had once been a man. On the crushed-in temple rested the corner of a small iron-bound chest, and the mummy face granuel ghastly under the faint light. It was plain that the man must have been killed by the thest falling from the top of the boulder and incturing his skull. I had no stomach to investigate the chest, and with a shudder I turned away from the horror of the thing.

'In doing so I noticed on the sand a small bap of coins, and hastily picked up those I have given you. A few steps took me to the water's cige, and a few strokes sufficed to bring me out into the blessed daylight and to the sight of living nen.'

Commander Hardy had evidently no relish for expatiating on his recent experiences; but, short as was the account we had just breathlessly listened to, it lost nothing in impressiveness on that account.

The captain was the first to break the silence which followed Commander Hardy's words.

'That there skeleton,' said he, 'must be old Malcolm's father. He'd gone secretly, as usual, for another pick at the stuff, and got killed. Poor devil, what an end! Howsomever, it's an ill wind that blows nobody good; and if he had lived we might have found the place empty.'

He turned sharply to Commander Hardy and asked, 'Do you think we can get the stuff out, eh?'

'Oh yes! Any one who can swim a few strokes under water can easily get into the cave, and by rigging up a block and tackle all can be hauled on board a boat. That's simple enough. The question is, Admiral, must we not communicate with the authorities at once and before anything else is done?'

'Most certainly,' replied the Admiral. 'Whatever's there is treasure-trove. No doubt you'll get a share for having found it, but everything must be done fair and above-board. No one must say a word about our adventures to-day, and I shall wire to the Home Secretary whenever we land.'

Commander Hardy at once acquiesced; and, the matter being thus settled for the time, we pulled swiftly back to the Lodge.

(To be continued.)

LIGHTNING AND LIGHTNING-CONDUCTORS.

By KILLINGWORTH HEDGES, M.Inst.C.E., M.I.E.E., Hon. Secretary of Lightning Research Committee.

HERE are few natural phenomena which make so deep an impression on mankind as thunder and lightning. Although we have ceased wondering at the developments of

electricity - which is successfully harnessed as a rival to steam for the propulsion of trains, and companies vie with one another for the han to distribute electrical power at a pressure which would be extremely dangerous unless under Proper control—a thunderstorm is considered a far nore serious matter, and many instinctively dread th knowing that there is a chance, perhaps very rande, of their being struck. Besides, every storm enails a real danger to property. To a large extent the feeling is a relic of the superstitions of our lorelathers, who regarded lightning as the direct namicatation of the wrath of some offended deity. la the time of the Romans, persons killed by lightning were considered to be hateful to the gil, and were buried by themselves, lest the ashes d other men should receive pollution from them. The Romans also avoided places struck by lightning; the houses, if damaged, were pulled down or fenced in, so that no one could use the buildings on which Jove had set the mark of his displeasure. It is curious to note that at the present time the same buildings are occasionally again and again struck, and that certain localities are visited by thunderstorms more than others-a fact which has been taken advantage of by the witch-doctors in South Africa, who are said to stand fearlessly in a certain spot during a terrific storm, whereas in the vicinity it would probably be very dangerous to do so, because the large amount of minerals in the rocks might divert the lightning. The superstition of the ancients may appear in this twentieth century to be extremely ridiculous to us; but we should not overlook the fact that when Benjamin Franklin -whose memory has been recently honoured by the erection of a statue in Paris on the two hundredth anniversary of his birthday-introduced the lightning-conductor, for many years his invention was opposed on the plea that 'it was as impious to erect rods to ward off Heaven's lightnings as for a child to ward off the chastening-rod of its father.'

To most of us the lightning-conductor is a

familiar object, and very often the kind erected by the so-called experts may be taken as an example of the proverb that 'familiarity breeds contempt,' as the original designs of Franklin have been neglected, and a large number of these lightning-conductors are fixed in a manner which renders them not only useless, but also they may possibly be a source of danger. A flash striking a faulty rod is more likely to be deviated and so cause more damage to a building by reason of what Sir Oliver Lodge has termed 'the spitting action' than if it were unprotected.

Before pointing out how many failures have occurred in the course of the development of the lightning-conductor I should like briefly to review what has been done with regard to the question of the protection of buildings from lightning. Although progress has taken place in every other branch of electrical science, up to the year 1878 no one seemed to trouble about lightning until the efforts of the Royal Meteorological Society established a committee of the learned societies, who brought forward their report known as that of the Lightning Royal Conference in 1881. Nothing further was done until 1901, when interest in the subject was again revived, first in Germany, by the Electrotechnische Verein of Berlin, who published a report; and in the same year, after a paper had been read by the writer of this article at the Royal Institution of British Architects, the Lightning Research Committee was formed, with representatives from several of the principal societies. It was decided to start de novo; so observers were enrolled throughout the United Kingdom, in many colonies, and in the United States. The actual effect of lightning on protected and unprotected buildings was tabulated, and in 1905 the committee published their report,* which is based on one hundred and fifteen detailed cases, although they received over five hundred from the official observers. Seventy-five buildings had no lightningconductors; the remaining forty which were struck were provided with what had been considered by those responsible for the buildings as sufficient safeguards in the way of conductors, and in spite of these precautions all suffered more or less, and the rods did not shield the buildings.

At first sight it would appear that we have been living in a fool's paradise with regard to the efficacy of Franklin's invention; but, in this country in particular, a faulty system has gradually been introduced which differs very much from the original design, and to this is mainly due the failures which have been enumerated. The celebrated scientist Clerk-Maxwell was the first to show what is necessary to protect a building, and he was followed by Sir Oliver Lodge, who pointed out that lightning discharges are not all of the

same character, and we must abandon the old idea that it is forked lightning which is most to be dreaded. In reality, the appearance of lightning has nothing to do with its potentiality; it has been shown by the eminent professor's experiments that there are two important classes of lightning-flashes, and that it is very necessary to distinguish between them, as the system of lightning-rods which may offer some protection from one class of flash may not be able to shield the building from injury by the other class.

The A flash is of the simple type which arises when an electrically charged cloud directly approaches the surface of the earth, no other cloud intervening. The ordinary type of lightning-conductor acts under these conditions in two ways: first, by giving off a silent discharge, which tends to nullify the effect from the cloud, and also by absorbing this effect and leading the electricity to earth. In the second, the B type, where another cloud intervenes between the cloud carrying the primary charge and the earth, the two clouds practically form a condenser; and when a discharge takes place the free charge on the earth-side of the lower cloud is suddenly relieved, producing an impulsive rush which is much more powerful, and may be compared to the sudden explosion of a high-pressure steam-boiler. In the same manner as the steam-pipes and safety-valves, which under ordinary conditions would relieve excess pressure, are ignored, so the B flash takes such erratic paths that, quoting the words of the Lightning Research Committee, 'no system of lightning-conductors of the hitherto recognised type suffice to protect the building.'

If we consider what enormous force has to be dealt with, how absurd it is to suppose that a flash which has perhaps travelled through a mile of space would consent to be led out of its course for the last few yards of its journey to strike one point while the metal-work of the roof and other parts of the house offer so many paths to earth! The fact that lightning will jump gaps of ten feet or more with ease, whereas a break of a few inches will stop the flow of the most powerful electrical currents such as are used for working our railways, shows what we have to control; moreover, the actual horse-power of a B flash probably exceeds the electricity being generated at the time by all the London electrical power-stations.

To understand what takes place when a flash of lightning strikes a building one must entirely clear away all preconceived notions which have been handed down from time to time, and which include such fallacious ideas as that a single lightning-conductor placed above the highest part of a building will protect a large area beneath; also, that to ensure safety one has only to erect the thickest copper rod that money can buy.

The Report of the Lightning Research Committee altogether dispels this mistaken idea of security. For instance, examples are given of

^{*}This is embodied, with many illustrations of damage to buildings, in a work entitled *Modern Lightning-Conductors*, by the present writer (London: Crosby Lockwood & Son).

roofs which have been struck at a point almost immediately under the higher portion of the building where the lightning-rod was fixed; and in other examples the heated air from a chimney has caused the flash to ignore the conductor. To obtain complete protection we must enclose the structure by a network of wires; and as this is practically impossible, the author has designed a modified arrangement which carries out the idea and at the same time does not interfere with the access to the roof; therefore repairs, &c., can be carried out in the usual manner. Either copper or iron wire can be used; the latter is preferable, because it is not such a good conductor of electricity as copper, and therefore tends to get nd of the energy in a safer and quieter manner. A galvanised cable of specially drawn iron wire is run along the ridge of the roofs, being kept a siort distance away by means of holdfasts; no unschily spikes are necessary, as the cable is simply run a foot or so above each stack of chimneys and opened out so as to present a number of points. The conductors descend to the ground, generally at each end of the building, in a straight line, being kep; well away from the walls, and are connected on all sides to the rain-water gutters; these are also connected to the rain-water pipes, which form part of the system. We have now formed the skeleton frame of the 'bird cage'-all but the bover portion. This is done by running a small iron wire at any suitable distance from the ground entirely round the building, joining it to the two down-conductors and the rain-water and other pipes. Still, the system is incomplete, as we have to deal with the most important part, 'the connection to

A digression may be allowed to explain what s meant by 'earth.' In telegraphy the current lases along the wire between the two instrumenta which are each connected to the ground at the two ends of the line, the earth forming the tum path. Similarly, in an electrical tramway the current flows by the trolley wire, and after popelling the car, returns by the rails and 'earth' to the dynamo. In these examples it is necessary to have a complete electrical circuit; but in the as of lightning the earth is used to damp out the fore which has been led by the numerous channels valid surround our protected building, and unis we can now disperse the flash quietly our about will have been in vain. There are two rays of effecting this. The first is by the use of enh plates, which may be of copper or iron, and here must be surrounded by charcoal and buried a permanently not ground; and this offers a difficuty which has been surmounted by the substituim of the patent tubular earth for the plate. A perforated tube furnished with a spike is attached a strong pipe and driven into the ground, other aghs being added until the moist strata is reached. The conductor is threaded down the tube, which is named full of granulated carbon, and a small tube attached to the nearest rain-water pipe ensures the necessary moisture. The number of these earths depends on the area of the building to be protected, and two at least should be used for an ordinary house, whereas in St Paul's Cathedral there were ten. Unless the lightning is well dispersed it will travel for yards to gas-pipes or other good conductors.

The committee's report gives particulars of several fires from this cause. A notable example is that of St Pancras Church in 1902. In this case part of the flash left the large copper conductor and travelled over the lead roof to the hot-water and electric light systems, while that which passed down the rod went to earth, following the gas-main, destroying many yards of pipe and setting fire to the gas. The lightning-conductors erected on the forty buildings reported on by the committee's observers certainly did not fulfil the object of lightning-protectors; in some cases the lightning struck a lower portion of the building which was supposed to be shielded by the rod, which it completely ignored; in other examples, the flash left the rod and passed by circuitous paths to other ironwork, such as gutters and rain-water pipes. The practice of using copper tape for the conductor and leading this round sharp bends doubtless facilitated the deviation of the current, and bad earth-connections intensified the result.

With the solid iron rods which are generally used throughout the Continent these failures do not occur, and every conductor, whether of iron or copper, should run in straight lines, and also be kept a moderate distance away from the building, so as to allow a clear run from air to earth. Another point to remember is to interconnect up all the rods. Possingworth House, near Heathfield, was struck twice in 1902, and damaged, although the roof fairly bristled with spikes, the all-important horizontal conductor along the ridge of the roof having been omitted.

The cage system of protection need not be unsightly. For instance, it has been installed by the writer in a modified form at Westminster Abbey and St Paul's Cathedral, and the numerous aigrettes or points which are used to discharge the electricity which gathers on a building during a storm are hardly noticeable. The few inefficient lightning-rods erected on our national museums, picture galleries, and other public buildings contrast most unfavourably with the more scientific methods adopted on the Continent, more especially in Germany, where in some cities the local authorities insist on the system being kept in an efficient condition.

Some of my readers will probably be more interested in the danger from lightning to human life. It is remarkable that, although there were many injuries and marvellous escapes, there were only two fatal accidents among the five hundred cases of buildings struck which were sent in to the Lightning Research Committee. The following suggestions may

be made. Keep as far away as possible from the fireplace, as if the chimney is struck the grate and surroundings will almost invariably be blown out into the room. Hot-water pipes are very likely to be selected, so should be avoided during a storm; also, do not sit in a greenhouse or conservatory, or take refuge in a barn or alongside a haystack. The idea that glass attracts lightning is absurd; in fact, if one does not mind the glare of the lightning, there is no evidence to show that it is unsafe to approach the windows.

Fatal accidents generally occur when people shelter outside a building. A wet wall often conducts some of the electricity, and a person standing near it provides a good path to earth. Specially avoid the proximity of a lightning-conductor; and as any pipes descending from the roof may act as conductors, keep as far away from them as possible. It is well known that trees are most dangerous, and I should like to point out that there is a great liability of being struck if one is anywhere under the boughs, as lightning striking a tree disperses like rain through all the branches, with perhaps fatal results to persons or animals in the area below. It has been stated that the beech is never selected by lightning. This statement has been disproved; in fact, according to the inquiry made by the German Government, the beech was struck more often than the pine.

In another research the poplar was damaged much more frequently than the oak. Trees act to a certain extent as lightning-rods, so that one is fairly secure in their neighbourhood-safer, in fact, than when on a treeless plain. It is then wiser to lie down during the height of the storm, and under no circumstances should one lead a bicycle or hold up an umbrella. It is not that the lightning is directly attracted by such objects; but a flash on its way to earth gives out innumerable smaller discharges; so to be near any object containing metal, which may be selected as offering the best path, is, to say the least, unwise, as one must remember that a shock which may only cause minor injuries if one's clothes were dry, might prove fatal to a person who has been for some time out in the rain.

In conclusion, it is to be hoped that the art of protection of buildings from lightning will advance from the rule-of-thumb method into which it has descended in the past to the more enlightened practice which Sir Oliver Lodge and other men of science have shown to be necessary. The public should also remember that the 1905 report of the Lightning Research Committee represents not only the results of their own investigations, but also includes the independent opinion of the various Continental authorities, whose advice has for some time past been put into actual practice in the countries which they represent. When protecting buildings from lightning one must bear in mind that the electrical energy generated by a B flash is sudden, like an avalanche; it will not take the easiest road provided for it, as if it were a trickling stream, but will crash through obstacles and make its own way, some portion of it taking paths which may be quite unexpected. The only way to protect a building is not to rely on isolated rods, but to utilise all the metal used in its construction, and so dissipate the great stored-up force by as many channels as possible, not as quickly but as quietly as possible.

THE BEGGAR. FROM THE FRENCH OF BÉRANGER.

It snows, snows white, and in the cold there prays An aged crone; on the church steps she kneels; Her cloak, in tatters, in the cold blast sways. This for her bread that she to us appeals. This church well knows her, ragged and alone In winter's days or summer-time indeed: Sightless and poor, alas! she makes her moan. Ah! give the alms of which she is in need.

Who this old creature was you may not know, So worn and thin, with scanty hair so gray. Queen of the greatest theatre; also, In former times our finest songstress gay. Young gallants raved of her in former years, To win her favour no restraint would heed, But dreamed or wooed, in happiness or tears. Ah! give the alms of which she is in need.

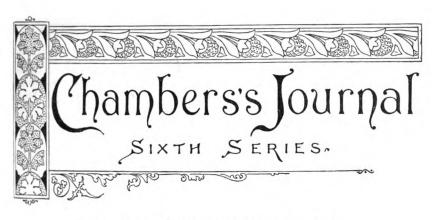

How often then, when at the playhouse door, She from her carriage saw the gazing crowd Awaiting there in masses to adore The actress whom they cheered with 'Bravos' loud, Then at her porch to hand her to her chair, Which to some haunt of pleasure soon would speed, How many rivals strove to show their care! Ah! give the alms of which she is in need.

Crowned as she was, by every form of art, She dwelt in wealth and riches for a while, For crystals, bronzes, statues, did in part, As gifts, from love to love, her time beguile. Her banquets gay fair-weather friends endeared, To seek good cheer and pleasure all agreed; The swallows from the house-eaves disappeared. Ah! give the alms of which she is in need.

Sad dreams, alas! for illness changed those days; Her voice was lost, and then—her eyes went blind; Poor and alone, she fell to beggars' ways; For twenty years she's asked church-goers kind. When rich, her purse was open for the seeking, To help the needy always was her creed; Her open hand is quaveringly speaking. Ah! give the alms of which she is in need.

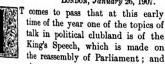

O misery! Have pity! O how cold
One feels! Her fingers, frozen in the blast,
The rosary itself can scarcely hold
(She might have smiled at such in days long past).
Poor, old, and wretched, she, in her sad plight,
Still calls on God to hear His daughter plead;
For faith so great, illumining her night,
Ah! give the alms of which she is in need.

A. FRANCIS STEUART.

THE HEART OF THINGS.

LONDON, January 26, 1907.

circumstances have conspired during recent seasons to make the subject one of keener interest now than in former days. For one thing, the home political situation has become very tense in many respects; and for another, the King's Speech has become a little less of a dry-as-dust formality and more of a living thing since it has been realised that the present Sovereign, always playing the part of the perfect diplomatist, takes a greater personal interest in its contents and its construction than used to be the case—an interest which has happily culminated in His Majesty's own personal delivery of the address from the throne n the House of Lords. Of course the Speech is not really the Speech of the King so much as that of the Prime Minister and the Cabinet; and though in practice the Sovereign seldom meddles with the matter or the manner of the document submitted to him by his premier statesman, still he has the privilege of doing so, and thus it is reasonable to suppose that a little of the individuality of the monarch may be impressed occasionally upon the generally solemn and stodgy sentences. Queen Victoria on one or two occasions certainly exercised rety active control over the parliamentary orations which were read in her name; notably in 1864, when the difficulties between Denmark and the Schleswig-Holstein duchies were in progress. Palmerston had and up the Speech as usual; but there was one nther bellicose paragraph in it to which the Queen bok such strong exception that as soon as she bid received the draft she sent a very plainly rouled telegram to the Prime Minister demanding ta excision, and eventually she had her will. Modgy as they are, there is a slightly varying daracter to be noted in these royal Speeches, to the Premier who is in power. The characteristic of the Palmerston efforts as exemplified

in the case just quoted was a touch of arrogance and menace. Gladstone and Salisbury made good, strong, simple Speeches; and while those of Melbourne are almost the most watery and insipid within memory, those of Lord Beaconsfield were certainly the most effective; indeed, it is said that he constantly introduced into his text more colour than other statesmen of the first rank considered to be necessary or desirable. The preparation of the Speech is really a rather complicated business. In the middle days of January the Prime Minister begins to ponder upon it, and then he discusses his ideas with the more important Ministers, particularly the Foreign and Home Secretaries. Next he writes the Speech in its three sections, and it is submitted to a full meeting of the Cabinet, criticised, altered; and then, when the Premier has again slept upon it, he gives a final touch to his handiwork and sends the draft off to the King. Eventually a meeting is called of the members of the Privy Council who are in the Cabinet, and over this meeting the Sovereign presides. A final glance is given to the document, and at last, in the presence of the Council, His Majesty places his signature at the end of it, so that there shall never be any doubt as to what it was that the King was meant to say. All very formal, very solemn, very important. And then the floodgates of parliamentary oratory are thrown open. Certainly the least formal and lifeless feature of the whole thing is His Majesty's personal delivery, for he contrives to impart a trifle of animation to his recitation, and it is always made in a fine clear voice. However, there is no room in these days for incident and the unexpected, as there was occasionally in former times, such as on the occasion of the very last Speech of William the Fourth. It was late in the day when the ceremony came to be performed, and the light was bad and so was the King's eyesight, so he had difficulty in making out the words of the manuscript, and he frequently referred to the Prime Minister with a 'What is it, Melbourne?' as he stammered through the opening sentences. He lost patience at last, and in an outburst of vexation exclaimed, 'D- it, I can't see!' Noble lords JANUARY 26, 1907. [All Rights Reserved.]

found it difficult to preserve their gravity of demeanour; bishops' faces became less solemn; wax tapers were hurriedly sent for and placed at the King's elbow, and then His Majesty made some apologies, and began the Speech afresh from the beginning.

It is a complaint against the present House of Commons by the dwindling number of parliamentarians of the old school who remain at Westminster that it is becoming too humdrum and prosaic and materialistic for those who used to say that it was the best club in London, and the place where they most felt the joy of the political-intellectual-social life. They do not look forward to the opening of a new session now as they used to do; even the claiming of seats on the midnight before the opening day is losing all the glamour of adventure. A rude shock was given to the men who pursue these traditions when, last February, Mr J. O. Andrews, who had lost his seat at the election and was an M.P. no longer, entered the House with the midnight party, and duly ticketed for himself a very excellent seat at a corner next the gangway. Gone are the days of ease and happiness in the House; the pleasant dinner-parties are less frequent; the joke, practical or otherwise, is a rarity. It is now on record that in the prandial way there is nothing at Westminster that is half so popular as that wonderful shilling dinner, consisting of a cut from the joint, two vegetables, bread, butter, and cheese. Such is the fare of Ministers even, and restaurant-managers, who marvel at the story, say that an attempt to give so much for the money would ruin them in a very little while. Of course the secret lies in the subsidy which the nation gives to the parliamentary kitchens. Everywhere, it is said, there is a dull practicalness coming into vogue. It is being suggested that for the future only a shilling or eighteenpence should be paid for the House of Commons paper-knives instead of twelve and sixpence as heretofore, on the ground that they might then disappear less frequently and permanently than they do at present. There would be fears for the decadence of the institution of tea on the Terrace in the summer-time in the company of lady friends were it not that no members have shown themselves more appreciative of such dillydallying in the sunshine while heavy bills are being pounded through the legislative machinery inside as, mirabile dictu, the Labour members! The House has ceased to regard it as essential that it should dress well. Hon, members put on their roughest and most comfortable working clothes when they go down to St Stephen's; it is the same even with the young bloods who are most watched, for Mr Winston Churchill constantly betrays that he does not care 'a hang' about appearances, and sartorially he is a poor governmental substitute for, say, Mr George Wyndham. Worst of all, it is being said that the House nowadays has no adequate sense of humour, and that it would hardly laugh even though an M.P., according to ancient custom, sat down upon his hat. It really only begins to see the queer side of things when it is getting through the long watches of the night, as it is becoming so addicted to doing, and has begun to feed upon the seven hundred eggs and one hundred and eighty devilled bones which are now indicated as the chief sustenance of Parliament during an all-night sitting. About four o'clock in the morning St Stephen's is by way of becoming really light-hearted and funny. But, oh, say some, for the halcyon days when the M.P. loved his practical joke! Think of the time when they shouted, 'Pickpockets in the Lobby! Member robbed!' when one of them, after some fumbling, said he could not find his pocket-book, and how they sent for a Scotland Yard inspector, and how the M.P. ultimately found that he had left his book at his tailor's when he was being 'tried on' in the afternoon. And, oh for the days when Mr Patrick O'Brien, Irish Whip, was caught in a hot bath when the division-bell rang, tried to dress himself without being dried, and reached the Lobby late with only one boot on! And the late Mr Wootton Isaacson, who in an all-night sitting was likewise caught bathing and rushed into the Government Lobby clad chiefly in a bathing-towel! Mr O'Brien said that a special 'division dress' ought to be put on the estimates for the use of batherssomething loose and Oriental. All such stories told of the ease of parliamentary life. Now, they say, it is harder, sterner, more matter-of-fact. Parliament certainly looks as if it meant business in these days, and feels like it, and the apostles of the new spirit will take a compliment to themselves from such comments as these., Keen men on the Government side will say that much of this is their doing; but while the Cromwellian sentiments of sternness and simplicity are undoubtedly strong among them, the work of toning down Parliament, as it were, was begun long before their day. I remember Lord Waleren, when Sir William Walrond and chief Conservative Whip, many years ago telling me that he made it one of his chief ambitions, in so far as lay in his power, to make the House attractive to the thoroughly practical business man. The country squire and the eldest son of the country squire are almost dead as types at Westminster. No doubt it is all for the best. It is for efficiency, and in that there is the consolation for the substitution, metaphorically speaking, of fustian for the silken robe. But more and more efficiency is needed; such is the constant murmuring now on the eve of a new session, as often before.

* * *

'And what of the Thames to-day?' Such might very reasonably be the burden of the early morning soliloquy of an earnest, thoughtful Londoner in anticipation of his first look through the daily paper. For how largely its river bulks in the great and continuous problems of the development of the Empire's city is a matter upon which its inhabitants

my not frequently reflect. Not merely because of is commercial importance, or because of its romance and traditions and modern wonders, the Thames rands for more to London than does the river of my other city in the world; and almost day by dar, in one aspect or another, it forces itself upon the attention of the people. First it is a question of pilots, next of steamboats, then of bridges, enbankments, cross-river tramways, and so forth; and now, at the beginning of another year, after all that has been done for this veritable parent of the Metropolis, in its old age it is asking for more and more attention, and its programme of arrangements for the immediate future has never been more imposing than at present. Already the dredgers, seam hoppers, and all the other paraphernalia of the river-engineers are at work towards the fulfilneat of a great scheme by which in one respect it rall be made different from what it has ever been, and from which in some three years from now it all emerge a better and more useful river than erer. This is to say, that the Thames Conservancy hard is engaged upon the great work of making a www deep-water channel from the Nore to Gravesesi which will be twenty-one miles in length, a thousand feet wide, and thirty feet deep. It will out four hundred thousand pounds; and of this am the Thames authority pays half, and the piers, and ships will be mulcted in the other half rar of extra payments during the three years the work will be in progress. But what will watern the average knockabout Londoner and the equalities stranger more than this is the manner in which another two hundred thousand pounds is to te sent in the widening of Blackfriars Bridge, the some most important of all the bridges that join the north and south. A peculiarly strong interest s of personal possession is taken by the cockney these bridges over the Thames, and people of raiosophic turn of mind may suggest that the timer in which they have earned for themselves in interest and even affection is curious and subtle. is reald be suggested that an appreciable portion ching London crosses these bridges either on foot on some form of vehicle twice a day, and the Period of doing so is almost inevitably one in tath there is a suspension of the work upon which te mind has been engaged and a pause for some the of reflection, which may sometimes be almost Richardons, upon the picture of big and wonderful ed committee London that is spread out on each to of the parapet. Years in London make a man different to many of the things of its glory and He will not lift his eyes from the termaper that he is reading as a motor omnibus thing him past the Houses of Parliament and Reminster Abbey; no emotion is stirred in him then on foot he crosses Trafalgar Square. But it s deems when the bridges are being walked. Bere it is, the black and winding band of river, so requesture and practical and purposeful and condicte to mental imagery in which nature and

history and the modern spirit of bustling commerce are congruously blended. And it always seems so new and interesting, so that even the most prosaic persons feel something of the thrills of pride and sentiment at each separate view. I know that if the Londoner came to analyse the emotions of a day, he would, perhaps sometimes to his surprise, discover that Father Thames had worked upon him the premier charm. That may be the reason why the bridges always seem to count with him as an intimate part of his personal London system, and why he constantly takes such an interest in all that concerns them and experiences a sense of unsettlement when they are in the contractors' hands. How it felt to everybody as if London were in hospital when not long ago London Bridge itself was being enlarged! And now it is the turn of Blackfriars Bridge for enlargement; and during the three years that the firm of Arrol will have it in hand we shall have again that little feeling of irritation and discomfort, the sense of upheaval and change, as when the plumbers are in one's house. As I have suggested, Blackfriars is the deputymaster of the London bridges, and it bears the second largest share of all the traffic across the Thames. Some time ago an official census was made of the number of vehicles that cross the four bridges in the city, and from six o'clock on one Sunday morning until the same hour on the following Sunday a careful count was kept, and it was found that in this space one hundred and twentyfive thousand three hundred and seventy-three crossings were made of London Bridge, one hundred and twelve thousand three hundred and five of Blackfriars, eighty-five thousand three hundred and fifty-three of the Tower, and only twenty-four thousand four hundred and thirty-two of Southwark, the cold neglect of the latter being due, it is interesting to note, to the steep gradient on the City side, of which both drivers and horses are extremely shy. Now, here is what may seem an odd point to some people. It was found that in the cases of London and Southwark Bridges more vehicles went over from the City to the south than came back, but that this difference was far outbalanced by the greater number that passed into the City from the south over the spans at Blackfriars and the Tower. In the result three thousand three hundred and fifty-one more carts and carriages came into the City in that one week than left it. It would be too much to expect the numbers to balance; but wherefore this great difference?

* * *

What has been known for many weeks past as the 'Book War,' with all its little intrigues, plots, and peccadillos, has served one or two purposes which were perhaps not contemplated by those who participated in it at the outset. It seems, without doubt, to have stimulated the public interest in books and bookmaking; and it is said by the big booksellers in London that times are

quite good again. They have been bad enough in all conscience since the days of the South African war; but heavy taxation on the one hand and an abnormally large proportion of poor books on the other, together with the increase of that species of review articles which consist of lengthy summaries and extracts almost telling the whole story of a book, may have had as much to do with this state of affairs as anything else. The 'war' has also given the public a glimpse behind the scenes of bookmanufacture. Sometimes the wonderment has been increased, and at others illusion has been dispelled. The readers know a little more; but still they know very little of the changes that have been creeping over the systems of authorship and publication during the past few years. Many of the oldest and most honoured methods and traditions, such as some of the most famous houses were built upon, are already dead. In the production of books sentiment counts for less and commercialism for more, far more, than it did ten years ago. Authors, backed by the Society of Authors, are keener in quest of their rights than they used to be; and the up-to-date publisher has taken several leaves from the book of twentieth century halfpenny journalism. By this it is not meant that he has developed any tendency, or any serious tendency, towards cheap effect and sensationalism; but he is leaning a little more towards enterprise, and he is engineering his schemes in new ways. Mr John Murray, head of one of the oldest and most respected houses, told recently of the system of editorship which he has personally practised upon many of the books which have passed through his publishing machinery. From this the public have benefited, and have need to be grateful; and perhaps in the long-run they have no less cause for gratitude to other big houses who have gone to much greater lengths in giving the people what they want in the form in which it is most agreeable and serviceable to them. It is certainly true that many books are published to-day and achieve great sale and popularity of the construction of a single sentence of which their nominal authors are quite innocent. The publisher as editor

and organiser conceives that there is a good book in a certain man if it could be got out of him; but the man may be either too illiterate or too indolent for authorship. But if he is willing, a medium is put on to him, and this medium extracts from him all the facts of which he is possessed, and then writes the book. There is no deception of the public, inasmuch as the matter is all the matter of the nominal author, clothed with all his full authority; but the manner is entirely that of another. I know of weighty volumes of legal reminiscence, of books of travel, and of works of expert instruction that have been successfully launched upon the market in this way. I know of a case where the author-medium had only a few hours' conversation with his man, and from it wrote a work that needed gold to buy it, and which was reviewed enthusiastically in hundreds of columns, though the nominal author was then at the other end of the world, and had never seen a single line of his book either in manuscript or print! Let it be added that without a shadow of a doubt he would have approved of every line, for the accuracy and intelligence and also expert knowledge of the author-medium himself were wonderful things. Recently, also, I heard the curious—and, as I was perfectly convinced, very true-story of a published work the substance-matter of which was told over the telephone to the man who had been engaged to write it up. In such circumstances books of a hundred thousand words are sometimes written in three weeks or less. On one occasion there was a celebrated army-officer home from a foreign expedition, with a good story to tell, and so an enterprising firm of publishers laid hands on him. He explained that he could not write, but that he was 'a devil to dictate,' and his time was limited, and he must see what was written. Accordingly, London was scoured for its very fastest typist, and she proved a marvel who could make words by keys almost as fast as by tongue. The officer sat down before her and talked his book, and before the end of the first week it was in the printers' hands! HENRY LEACH.

THE LORD OF THE MANOR.

T was hard for Mr Castlerayne to act just at that moment as the fine gentleman that he believed himself to be. He could not exactly reproach his sister, seeing that most of her slender fortune had gone to satisfy

his own extravagance. But a little time ago he had entirely been under the impression that Gertrude had some hundreds of pounds at her disposal. It might have been that she had paid some of his more pressing debts, for the head of the family had never troubled himself about them.

'There is no occasion to blame yourself, my dear,' he said magnanimously. 'I have no doubt that you have acted for what seemed to be the best. I dare say we shall find some means to satisfy the rapacity of that fellow Foster. Meanwhile, I will go as far as the hospital and see Craggs. I have not the slightest doubt that his lawyers are acting on their own responsibility in this matter.'

Castlerayne spoke lightly and pleasantly enough, but he was haunted by a certain wearying doubt as he crossed the Common. The violence of his sister's agitation had afforded him a clue. There had been

no occasion for so marked a display of feeling. Casterayne did not forget how great and tender an interest his sister took in the hospital, and how she had fought for the poor people there for the last twenty years. He put the doubt from him as unworthy. Gertrude would never have committed so has an act of treachery.

The Common lay smiling in the still September sunshine. It was one of the golden days with a touch of autumn in the air. The seed-pods of the gone crackled; the hum of the bees rose high in the air. For fifty years now Castlerayne had marked the changes of the year there; man and boy, it had become part of his existence. He began to realise what the loss of it all would be There he had shot his first grouse; there he had found the hawk's nest. His mind travelled back over the level range of the years. And it was all going at last—he had frittered it all away. There was the glorious fringe of gorse and heath and heather beyond the Common, where by this time villas and streets of houses might have stood if he had not been so filled with his pride of race. A duke had done the same at Eastbourne, and accordy had thought any the worse of him. After il it would have been no very great inconvenience to have a hotel erected on the site of the Dower-House Perhaps there was reason in the action that Craggs had undertaken; at any rate, a graceid surrender would have obliterated the necessity for the disgraceful bankruptcy that Castlerayne aw before him.

He came at length to the hospital, bathed in the brown light of the September afternoon. An elderly woman with some kind of lacework before her curtaied to him. A couple of shy children carged from one of the dark doorways and wated their forelocks. There was something stating about the process.

Craggs roared a welcome as Castlerayne knocked us the door. The old man sat in his big arm-chair before a wisp of fire in the grate, for the rheumatism was hard upon him. He had a big book open as little table by his side, and Castlerayne could set that it was a volume of Cobbett. The old man beginded his visitor with surprise.

Well, this is a nice mess you've got me into!'

Crago indicated a hardwood chair on the other sit of the fireplace. He did not seem in the least impressed by the importance of the occasion. It riped his iron-rimmed glasses on a flaming red landstrahief, and replaced them carefully. There was no sign of the victor about him.

I'm sorry to hear it, sir,' he said. 'I'm doing he best I can for everybody. I'm not by disposible that I can for everybody. I'm not by disposible like the Quaker in the story. You should the same some and fought that action, I guess.'

It is easy to be wise after the event, Craggs.

To do my solicitor justice, he strongly advised me
to terms with you. I honestly believed

myself to be entirely in the right, and so I refused to do anything of the kind. And now your solicitors are pressing me for an enormous bill that I can't possibly pay. If the money is not paid I shall be turned out of The Towers and everything will be sold. As you are so tenacious on the subject of your own house, perhaps you can judge of my feelings, Craggs.'

Craggs nodded thoughtfully. He was not moved to any display of extravagant sympathy. From his hard, logical point of view, the squire had brought this thing on himself.

'I could do nothing else,' he said. 'The Lord put it into my head as I was to be the guardian of these poor folks here. He led me to look up that old charter; and then I found out as the Common really belonged to the hospitallers, who could fit it to any purpose as they'd a mind so as to make a little money out of it. There was money provided by the will of your great-grandfather to endow the hospital for ever, and your grandfather took and spent every penny of it amongst his dissolute companions. And you never did a thing for us, squire; and you can't deny it. If it hadn't been for Miss Gertrude we should have all gone to the House long ago. That's why I took action under our rights conferred by the charter. When the money was found, no time was lost in making our position clear.'

'But who found the money, Craggs? One of your Radical associates, I suppose—the set of people who are never happy unless they are setting class against class. Or perhaps you are in the hands of some speculative money-lender'—

'Nothing of the kind, sir,' Craggs cried indignantly. 'The money came from somebody who is very dear to us—a lady, in fact. But I am talking too fast, like the querulous old idiot that I am. After all, it's no business of yours, squire.'

Castlerayne was ominously silent for a moment. His face had turned very pale; then it flushed very red till there was a mist before the eyes of the squire. He was likely to flare out there and then in a sudden fit of wild Berserk rage, the strong, hasty passion of the man who usually is of even temperament. He restrained an impulse to take Craggs by the throat and choke the life out of him.

The fit passed presently, and left him trembling and breathless. Craggs, staring thoughtfully into the fire through the round glasses, saw nothing of this. He was convinced that the squire didn't suspect anything. He could not look into the black, raging heart of the other. It was some little time before Castlerayne spoke again.

'We need not trouble about the past,' he said.
'It is the future that concerns me. I never thought that I should come here to ask you a favour, Craggs. I bear you no malice. You have fought me openly and honourably, and I am beaten. But from your solicitors' point of view it is a different matter. They look upon this as a

mere money-making game. They are going to have their pound of flesh or force me into bankruptcy. I want you to tell them to give me a little time—say a month. If you will do this for me'—

'I'll do all I can, squire; though the matter you mention is out of my power. It's a dreadful thing for a gentleman in your position to find that—

But I'm getting presumptuous.'

Craggs thoughtfully wiped his glasses again, and Castlerayne stared moodily into the fire. He was cherishing vengeful thoughts now. He was in a black and bitter mood which would considerably have astonished the old cobbler if he could have looked into the mind of his visitor.

'I suppose that you will close with these hotel-

people now?' he asked.

'No, we sha'n't,' Craggs returned with something like a smile. 'There's a better scheme than that. It was useless to bring the scheme before you, because you would have been certain to oppose it. Lord, how short-sighted some people are, to be sure! And how the blessing in disguise is regarded as a black misfortune! You're down on your luck to-day; but the good time is coming, a far better time than you deserve, if you'll pardon me for saying so. I'll do what I can with the lawyers. I'm afraid, though, it isn't much good.'

In his heart of hearts Castlerayne was of the same opinion. But he was not thinking of those learned in the law just at that moment. He had something sterner to distract his attention. His face was dark and stern as he made his way across the Common in the direction of The Towers. He had to deal with the black treachery, as he called it, existing under his own rafters. He no longer doubted where the money had come from to fight Craggs's action. Out of her sympathy for the hospital, Gertrude had found it. In a mean and despicable manner she had helped to ruin her own flesh and blood. If the means had not been forthcoming Craggs could never have been successful in his action; nay, he could never have brought an action at all. And the result had been to drag down an honourable name and cause an unfortunate man to go into a vulgar and sordid bankruptcy. Castlerayne was quite sure that he could have pulled round but for the treachery on the part of his sister.

He swung through the heather, lashing the tips with his cane as he went along. He came at length to his own room, where the candles were burning on the dressing-table and his evening suit had been laid out by his man. He changed very slowly and

carefully. Rarely had he taken more pains over the setting of his black tie. Outwardly he was cool enough, but inwardly he was raging. He was hardly conscious of the fact that his lips were twitching strangely. There was a queer contortion of the left eyelid. The healthy brown of the face had given way to a positively gray tinge. But Castlerayne heeded it not.

Down in the drawing-room the lamps were lighted. Nobody was there when the master of the house arrived. Everything looked so orderly, so refined, so fastidious; there lay no shadow of poverty there. The clock over the fireplace chimed the half-hour after seven; then the door opened and Gertrude Castlerayne, attired in some soft gray silk, came in.

'As the evening was chilly, I thought that you would like a fire, Rayne,' she said. 'What is the matter? How gray and strange your face looks!'

She started back, filled with some undefined fear; but Castlerayne came forward and took her by the shoulders. She had never seen her brother like this before. Her own face had gone as pale and chill as his. He seemed to have some difficulty in speaking.

'I have seen Craggs,' he said between his teeth. 'He did not mean to betray you, but he has. And only this afternoon you told me that you had lost all your money. I know where all that money has gone. There is no need for you to prevaricate. So it is from my own household that the treacherous blow comes. After all these years! Men have done murder for less than this before now. But I shall say nothing. I shall leave it all to your conscience. I shall, I hope, not forget that so long as you are a guest here'—

A quick, broken cry rang through the room, half-drowned by the clang of the dinner-gong. With white face and startled eyes, Gertrude Castlerayne faced the speaker.

'Rayne,' she wailed - 'Rayne, you are cruel!

Oh, so cold and cruel! A guest in the house!

I! And after all these years, to think'—

(W:)

'Will you take my arm?' Castlerayne said. 'I heard the gong. Do not let us forget that, after all, there are certain social obligations to observe.

Will you, please?'

Gertrude Castlerayne sank to her knees on the floor; her head had fallen into the seat of a chair. Her form was torn by passionate sobs that seemed to choke her. The door opened again, and May stood astonished and amazed by the extraordinary scene that lay before her.

(To be continued.)

THIRTY-THREE YEARS' HARD LABOUR AT WESTMINSTER.

PART II.

INCE I first knew the House of Commons the method of procedure and the style of debate have greatly altered. Obviously, the latter is a sequence of the former. Thirty

years ago the Speaker took the dair at four o'clock. Questions began half-an-hour later, the progress of interrogation frequently extending to six o'clock. Then, as now, the text of questions was printed on a paper in the hand of crery member. Nevertheless, in accordance with immemorial custom, every member mercilessly read aloud the full text of his question. The lish members beginning to fall into line under he command of Parnell, shrewd Joseph Gillis Biggar quickly perceived opportunity here provided of obstructing business. At his suggestion they put down questions by the score, making tem as lengthy as possible, as controversial as the spervision of the Speaker permitted.

That is a pleasing habit not unfamiliar at the resent day. But in the seventies and the early sessions of the eighties obstruction had another rapon in its armoury. In those happy times here was nothing to prevent a small but active ique, whether it was called the Fourth Party or bonged to the Parnellite faction, from getting p a wrangle over a Ministerial answer to a restion, and moving the adjournment in order discuss the matter at length. To-day leave is non occasion given to move the adjournment, he privilege being unhampered by the absolutely tile condition that the request shall be supported y forty members. But such motion may not be made till the close of the question-hour; and, if ermission be extorted by the support alluded to, date may not open till the dinner-hour, leaving is ordinary course of business undisturbed.

On one of the earliest days of the Parliament of 1880 Frank Hugh O'Donnell, scarcely veiling ander form of question an attack on a newly mointed French Minister to the Court of Stanes's, met remonstrance by moving the adjournment. This happened at five o'clock in the distribution, midway in the list of questions. A row assed, prolonged till one o'clock the next morning, then, Mr O'Donnell retiring in a state of physical chaustion, the subject dropped and the Speaker gavely called for the next question on the paper.

One result of this state of things was to prevent the cream of debate from rising till after the dinner-bor, an arrangement that involved late sittings. To day, with the House master of its own time, questions are disposed of and the Orders of the Day entered part of the things of the Day entered natically closes at eleven. The great guns are fired of as early as possible, invariably before dispersal

for dinner. In former times, with the length of sitting unlimited by the Standing Orders, the real business of debate did not begin earlier than ten o'clock, when members began to stream back from dinner. When Disraeli and Gladstone faced each other across the table it was a common thing for the Leader of the Opposition to rise at eleven o'clock to wind up a critical debate, and talk for an hour and a half, leaving the Leader to reply at similar or greater length, regardless of the glowing dawn.

In altered circumstances the style of speechmaking becomes wholly different. Then men orated; now they talk. When I first knew the House no speech in full-dress debate was regarded as complete unless it were rounded off by elaborate peroration. In this competition Gladstone was easily first. Disraeli, who among superb parliamentary aptitudes cannot justly be described as an orator, also had his pet peroration. It was pompous in conception, of the tinkling cymbal order in construction. Gladstone's only competitor in this development of oratorical art was John Bright. Varying his ordinary practice of delivering the main part of his speech without the assistance of a note, Bright always carefully wrote out the text of the peroration of his great speeches. He did not necessarily read from the manuscript. It was at hand in case of need.

Another adornment of speeches which did not survive the seventies was the introduction of quotations from the classic poets. John Bright, of course, in this competition sat out, as they say of the fourth partner in bridge. I am not certain if Dizzy did not occasionally try his hand at a Latin tag, but I do not remember hearing him. Gladstone, with the literary wealth of Athens and Rome at hand, frequently gilded his speech with choice extracts of the ore. Here his worthy competitor was Lowe, equally facile. When, in forming his Budget, Lowe embodied a match-tax, ruining his reputation as a financier and imperilling the safety of his Government, it was shrewdly suspected that he was allured by the fancy he, with almost childish delight, communicated to the House of printing on the match-box stamp the motto, Ex luce lucellum. As was written of one of old time, 'he had his jest, and they [very nearly] had his estate.' He saved his Ministerial life only by hastily abandoning his match-tax and his motto.

In House of Commons debate to-day the peroration is as much out of fashion as are the costumes worn in Goldsmith's comedies. The final halt made by the vanishing custom was on Budget-night. Through the last quarter of the nineteenth century the Chancellor of the Exchequer expounding his Budget was expected to make several little jokes and one

serious peroration. Never on such a momentous occasion did Gladstone condescend to the frivolity of a jest; the sustained eloquence of his peroration made up for deficiency in that direction. Harcourt was the first Chancellor of the Exchequer systematically to flash over arid wastes of revenue returns the light of humour. His example was followed by such unexpected practitioners as Mr Goschen and Sir Michael Hicks-Beach. In the twentieth century little jokes—the most telling relate to the fluctuating sale of rum and the yield of the death-duties—are still made by the Chancellor of the Exchequer on his annual field-night. But, like 'the harp that once through Tara's halls the soul of music shed,' the peroration is dead.

Another marked change wrought by the hand of time in the habits of the House of Commons relates to dress. I have a precious print which shows the House of Commons assembled in the session of 1821. Members are seated in the old House, dimly lit by candelabra pendent from the roof. It is the most appallingly respectable assembly I ever set eyes upon. Neither whisker nor moustache varied the grimness of the sedate countenances. All are dressed alike with high coat-collar, stock carried up to chin, trouser cut tight to the leg and drawn over the instep by a strap. I showed the print one day to Frank Lockwood, beloved equally of the Bar and Parliament.

'How decorously dull!' he exclaimed, regarding the scene with quick interest. 'How portentously respectable! There does not seem to be a single Irish member among them; nor'—he added, running his eye again over the crowded benches— 'even a lawyer.'

Sir James Ferguson, Postmaster-General in the Second Salisbury Administration, tells me he remembers a time when no member of the House of Commons who respected himself and his constituency sat in the presence of the Speaker without wearing gloves. Sir James, elected member for Ayrshire whilst he was fighting in the Crimea, entered the House in 1854, and is from that point of calculation nineteen years my senior. I never saw the gloves, but I have vivid recollection of the Sunday go-tomeeting sartorial style of members of Parliament in the seventies. Every one was black-coated and, of course, top-hatted. One named Monk, who sat for Gloucester, session after session created a sensation, on the whole painful, by presenting himself on sultry days in a dove-coloured suit. It is true his late father had been a bishop, but it was felt that he was rather imposing on the distinction.

I remember another shock suffered by the House when Lord Randolph Churchill entered wearing a pair of tan shoes. The Fourth Party was then at the height of its impudence, the plenitude of its power. Its young leader had for months alternately bullied the Prime Minister and tweaked the nose of the Leader of the Opposition. These things had been suffered, not gladly, it is true, but in recognition of impotence to withstand them.

This tan shoes atrocity was, on both sides of the House, felt to be going literally a step too far.

At this date it is curious to reflect upon these dead-and-gone emotions. On sultry afternoons the benches of the House of Commons present a sartorial appearance suggestive of Henley on Regatta-day. The cylindrical silk hat, which within the memory of the present Speaker was regarded in the light of one of the pillars that sustain the British Constitution, is rarely seen. Straw hats, Homburg hats, and the common 'bowler' have rudely shunted its solemnity. A working-man member, returned for the first time to the present Parliament, has beaten the record by presenting himself in a soft brown wideawake, the rim of which is in size and proportions planned on the scale of the sloping roof of a Swiss chalet. As for clothes, anything will do; the lighter in colour, the less conventional in cut, the better. In summer-time the absence of a waistcoat is amply atoned for by the presence of a cummerbund.

It was in the last Parliament elected in the reign of Queen Victoria, the first King Edward VII. opened in person, that this sartorial revolution was completed. With it came in the fashion of Tea on the Terrace. That such things were accomplished under the genial, happy-go-lucky premiership of Mr Arthur Balfour is a circumstance in which some critics may find a moral. The function of Tea on the Terrace was a natural efflux of the state of things existing in the first five years of a new century. Mr Balfour had at his command an overwhelming, and, up to the time of Mr Chamberlain's excursion into the field of Protection, a united and docile, majority. The last thing demanded from them was contribution to debate. Votes, not talk, were what was looked for from their loyalty. They could not be expected to sit silent hour after hour listening to hon. gentlemen opposite, nor could they be trusted to remain at hand in the Library or Smoking-Room. With quick intuition, the Whips saw the possibilities of an afternoon function to which ladies contributed the charm of their presence. Tea on the Terrace was accordingly encouraged in high quarters. London society eagerly swallowed the bait, and the worried Whips were soothed by the knowledge that at the sound of the division-bell a battalion of Ministerialists would sally from the Terrace to resist the machinations of the Opposition trying to rush an unexpected division.

Not least thorough in the changes wrought in the House of Commons during the last three decades is that affecting the personnel and the position of the Irish Party. When in 1874 they came in with a rush, they were like a string of gamins breaking in on the sanctity of the close of a cathedral. The old traditions of the House of Commons imposing discipline and almost abject submission to the authority of the Chair, deeply rooted, were defied. The authority of the Speaker in pre-Parnellite days is accurately indicated by the old story of a threat to

'name' an offending member. 'And what would happen if you had done it?' one privily asked the Speaker. 'Heaven only knows,' answered the right bon gentleman. For generations a vague, obscure threat had sufficed to subdue the most reckless misdoer. Before Parnell and Mr Biggar had been long to the fore it became necessary to enact a Standing Order attaching definite penalties as a consequence of the Speaker performing the ancient rite of 'naming' a member.

Mr Butt, himself an old parliamentary hand, was in the first session of the Disraelian Parliament so deeply imbued with the traditions of the House that he shrank from direct conflict with the Chair. There came a night when he, once the popular idol of the Nationalist Party, quitted the Irish camp below the gangway to the left of the Speaker, seating himself, in sight of a full House, in the serener quarter above it. Parnell thereupon, with the assistance of his grotesque, honest, delightfully original lieutenant, Joseph Gillis Biggar, took command, entering upon a campaign which before his fall transmuted the parliamentary atmosphere, transformed its methods of procedure. The evolution of these two was one of the most remarkable, not the least momentous, episodes in the parliamentary life of the last thirty years. One, a Cambridge man of aristocratic birth; the other, a provision dealer from Belfast, uncultured, uncouth. The two extremes were drawn together by common hatred of the Saxon, stern resolve to smite him in his most sacred temple. At the outset they were angularly unfitted for the self-appointed task. Neither had that fluency which is the common heritage of their countrymen. They turned the disqualification into a weapon of war. If, being on heir legs, they could not straightway hit upon the preise phrase they sought, why, let the House of Commons wait till they did. The interval would are by wasting a minute of public time, and in the business of obstruction every little helps.

Joseph Gillis, enlarging on the principle, on a famous occasion held the House of Commons at bay whilst in husky voice he read to it extracts from a Blue Book. At a quarter to nine o'clock, the entertainment having commenced at five o'clock in the afternoon, his voice began to fail. The Speaker, rising to order, called attention to the rule requiring members to address the Chair; 'and,' he added, 'the observations of the hon member have not for some time past reached me.' 'Very well, sir,' said genial Joey B., ever ready to oblige, 'I'll come closer;' and placing his Blue Book under his arm and picking up his tumbler of water, he stepped across the gangway, taking up a position conveniently under the hapless Speaker's left ear.

These deliberate systematic outrages on parliamentary etiquette and tradition in time worked out the redemption of the House of Commons. Up to the incursion of the Parnellites, rules of procedure handed down from Stuart times, whilst occasionally failing in their purpose, fared well enough. Evidently they must be recast to meet the new order of things. In the eighties, the House, most unwilling to move in that direction, gave up much time to reforming its ancient Standing Orders. The adoption of the closure, violently resented as an infringement of the privilege of free speech, did much to deliver the majority from the tyranny of the individual. The automatic interruption of debate, first on the stroke of midnight, now at eleven o'clock, struck at the root of possible disorder by minimising the recurrence of late sittings. The appointment of Grand Committees, involving a system of double labour shift, largely assisted in the furtherance of work achieved in a session.

But as the Empire spreads, the burden of legislative labour increases. In this twentieth century the Mother of Parliaments, a weary Titan, yearns for the coming of the inevitable time when her load will be lightened by the devolution to local bodies of legislation on local matters.

SLIOCH'S TREASURE.

CHAPTER V.

HE next day was the Twelfth; but though the birds were plentiful and not too wild, I am afraid none of us shot well. We all felt like conspirators, and every now and again

exchanged whispered confidences, and every now and again exchanged whispered confidences, it dinner the Admiral's wife took us to task about our lack of interest in the day's sport; but, fortunately, just then a telegram was handed to the dinital intimating that the Coastguard officer would write the next morning, and that, under his supervise, the contents of the cave were to be brought to the surface. We took Mrs Benbow into our constance, and all sat up late that night discussing

how the treasure could best be recovered, and expressing fervent hopes that the weather might be favourable on the morrow. I, at least, slept but little.

The morning fortunately broke calm and bright; and after we had finished breakfast Captain Wright, the Coastguard officer, was announced. He listened with great interest to the Admiral's story, heartily congratulated Commander Hardy on possessing the combination of mental and physical abilities which had enabled him to achieve such wonderful success, and cordially approved of the arrangements proposed.

Accordingly, we lost no time in getting on board the yacht, and with a large fishing-boat in tow started for the cave. We anchored between the wreck and the entrance to the small bay, transferred a host of appliances got together by Commander Hardy to the fishing-boat, and soon were floating just above the entrance to the tunnel. Manifestly the first thing to do was to secure the boat; so we backed her stern close to the rock with a view to find, if possible, some projection to which we could make a rope fast.

As we touched the rock just above the tunnel the Admiral put out his hand to steady the boat, and giving a vigorous pull to a projection on the face of the rock, exclaimed, 'Here's the very thing, Hardy. I suspect there's been a rope here before. Anyhow, nothing could be better;' and with that he made fast the stern to the shore.

An anchor was then put out from the bow, and the boat thus securely moored within convenient reach of the submarine entrance to the cave. Commander Hardy then arranged a short code of signals with the captain, and, equipped as he was on his first descent, dived below.

The bubbles of air had scarcely ceased to rise when the signal came that he had reached the shore of the cave, and the captain immediately fastened a strong hawser to the end of the rope he had paid out when Commander Hardy dived. To this hawser were fastened at intervals strong blocks, through which ran an endless rope; and on the signal being given that all was clear on board the boat, the hawser was slowly pulled over the side. In about ten minutes Commander Hardy signalled that his end of the hawser was fast, and the captain, taking in the slack, attached the other end securely to the boat and adjusted the length of the endless rope. Anything fastened to this rope could thus be pulled from the boat to the cave or from the cave to the boat. The first bundle to be sent in was a waterproof case containing candles and matches; and when this was signalled as received in safety, it was followed by a hamper containing tools, a rope-ladder, &c.

Then stillness and silence. The cable and rope hung motionless, with every eye fixed upon them. No one spoke, but the air throbbed with the concentrated thought of what would happen next.

Suddenly the tension was broken like the snap of a bow by Commander Hardy bobbing up at the boat's side. He climbed on board, and slipping on an ulster, said, 'Now, Captain Wright, I think everything is in readiness for the inspection of the cave and its contents. I have left a number of candles burning, and if you don't care to dive, we can easily rig up a cradle and take you down in a few seconds. The venture looks far worse than it really is. Indeed, I question if you ever bathed without being longer under the surface than you will be in going into the cave.' Seeing Captain Wright hesitated, Commander Hardy slipped overboard, and almost before we realised he had gone he was back in the boat, and taking a candle

from his mouth, showed us the wick still smouldering. 'There!' he laughed, 'that will convince you, surely.'

'Well,' replied Captain Wright, 'I suppose it's my duty to inspect the cave. I won't venture to emulate your feat of diving in, but if you'll see me through I'll risk the cradle.'

'I'm very glad to hear it,' said Commander Hardy; and, turning to me, he added, 'Will you come too, Charlie? We'll need some assistance.'

'May I, Admiral?' I eagerly asked. 'I'll take the cradle if you like.'

'Is it quite safe, Hardy?'

'Most certainly, or I would never have made the proposal. Why, I think you should come also, Admiral.'

'No, thanks,' laughed the Admiral; 'that would be too much of a joke. But Charlie can go if he likes, I suppose.'

'Thanks, Admiral!' I exclaimed.

'Come on, boys; get ready the cradle.'

This was soon done, and I volunteered to go first. Captain Wright assented with alacrity, and in a second I was in the cradle and being hauled below. Commander Hardy descended through the water by my side like a huge fish, and before I realised anything of the wonders of the passage he had me by the hand, directing my steps up a shelving bank of sand. Releasing myself from the cradle, we hauled it back for Captain Wright, and in a minute he stood beside us on dry land.

Eagerly we looked towards the huge boulder on which the treasure lay piled, the massive chests showing up weirdly in the flicker of the candles. No better place for safeguarding it could be imagined.

'Come, come,' cried Commander Hardy, 'the first thing is to make ourselves comfortable;' and opening a waterproof bundle which lay at our feet, he produced some rough towels and three pyjama suits.

As Captain Wright and I rubbed ourselves down we saw Commander Hardy pulling something in from the boat, and when two spades appeared we looked inquiringly at him. Turning to Captain Wright, he said, 'I thought that before we did anything else we ought to bury the remains lying at the back of the rock.'

'Of course, of course,' assented Captain Wright.
'Show us the place, please, for somehow I don't fancy handling these chests with a dead man to keep tally.'

We followed Commander Hardy round to the back of the rock; and there, lying just as he had described them, were the remains of one who in all probability had helped to amass the treasure. It was a ghastly spectacle we gazed on, and I shuddered as, with an effort, Commander Hardy and Captain Wright raised the box whose corner rested inside the awesome skull. In silence they dug a grave in the sand, and soon, much to my relief, the thing was decently interred.

The cave had the temperature of a wine-cellar, and Captain Wright wiped his brow, saying with maffected emphasis, 'Man, I'd rather be out with the Excise than at this job any day.'

'Well, well,' sympathised Commander Hardy, 'maybe old Slioch wasn't a teetotaler. Suppose we have a look round before tackling what's on the top of the rock. I've not been farther into the are; so take a candle each, and let us explore it.'

As we advanced the cave narrowed sharply, and about fifty feet from the back of the rock became just wide enough to allow of our walking abreast. A few steps farther on, and it broadened out and ended in an oval chamber, from which we saw, at a great height above our heads, a goodly sight, which I am sure heartened us all—a gleam of blue sky. This evidently accounted for that absence of absolute darkness which Commander Hardy had noticed on first entering the cave. A cursory cumination of the chamber by the aid of the candles showed us that it had been used for human occupation, but disclosed nothing likely to be of nine or interest except some large sea-chests ranged spins the inner wall. To raise their lids was an casy matter, but we only found a varied assortment of ship's stores and some clothes.

'Nothing to keep us here, I think,' said Com-

'Nothing,' assented Captain Wright. 'But I hope you won't have to repeat that remark from the top of the rock outside. Come along! Anytow, we should find something worth taking in the bor we had to lift. Poor fellow! I only tope we don't get more than we bargain for, as is did.'

Soon we were standing round the chest, which, sow that its interest was no longer overshadowed by its dead man, we were eager to break open. It was nade of some hard wood, strongly bound with iron, and took us so long to break open that half-way intogh our task Commander Hardy returned to its bat for a few minutes in order to assure the similar that we were all right, and hoped soon to be some tangible assurance that we had really istanded Slioch's treasure.

At length we succeeded in forcing open the chest, and pouring from it into the sand fell a bewildering assortment of gold and silver coins. Each one repicted up seemed different, and it was manifully hopeless there and then to estimate their blue. So we hastily collected them together, put is marmest of our success.

So son as a signal from the boat informed us of the saie arrival of the last bag, we turned to the rick. After one or two attempts, we succeeded in throwing a rope over the top of the pile of chests, and making sure that it would not dialodge anything, Caprain Wright and I held it on one side while Commander Hardy climbed up by it on the other. When he gained the top we threw him a caple of candles, and having lit them, he examined

the pile, so far as was possible without moving anything, with the utmost care.

When he rejoined us he reported that the pile seemed to consist of a miscellaneous heap of chests, many like the one we had broken open, but others larger and not so strongly made.

'Now, Captain Wright,' he continued, 'looking to the length of time it took us to break open the first chest, it occurs to me that the best thing we can do is to send up all the smaller chests to the boat as they are, ship them on board the yacht, and open them at our leisure when we get back to Eriboll. What do you think?'

'Well,' acquiesced Captain Wright, 'that will certainly save our time considerably. If you will send down as many of the smaller chests as you can get at, Mr Murdoch and I will despatch them to the boat.'

Commander Hardy did not hurry himself; and after fifteen had been carefully separated and lowered he called out that he could not get at any more without help.

'Now,' he said, 'I think we've all fairly earned a rest, so I'll join you, and we'll have something to eat, and discuss our next move.'

While we were eating our sandwiches Commander Hardy explained that, so far as he had been able to see, there were still some of the smaller chests on the top of the rock, but that they were so covered by the larger chests that it would require our united efforts to get at them. We agreed to break open those of the big chests which were most in the way, and send up their contents in bags; so, finishing our lunch, we all mounted the rock and began with a huge chest which stood in front of the others. We forced the lid without much trouble, and found that it was filled with a miscellaneous collection of plate, all in a more or less battered condition. We threw the contents down on the sand; and another and another of the large chests yielding the same kind of plunder, we soon had a small fortune in plate lying below us. Clearing away the now empty chests, we got at the remainder of the smaller ones, and sent them up to the boat. This left the pile reduced to the largest chest of the lot, a massive affair of dark wood, more thickly and strongly bound with iron than anything we had seen. It rested on the rock itself, and had every appearance of containing the most valuable and carefully guarded portion of the treasure. I had a crowbar in my hand, and was just about to try if I could prise off one of the iron bars, when Commander Hardy, showing more excitement than he had done all through, shouted, 'Stop!' and caught my arm in a grip that was not to be gainsaid. I drew my breath sharply with the pain of his hold, and he at once let go and asked my pardon most apologetically.

'I'm sure, friends,' he continued, 'we have done enough for one day. Let us follow the chests; and even if we never see this place again we need not grumble now that we have so much safely out.'

Nothing but the intense excitement of our occupation could have kept Captain Wright and I on our feet so long, and with Commander Hardy's suggestion came a reaction that made the deck of the yacht seem worth all the treasure-caves in existence. In a trice the cradle was rigged up, and without another word we were blinking on board the boat. The Admiral had, we found, been taken off by the dingy; and, getting up the anchor, we pulled a right-well-ballasted boat alongside the yacht. Great excitement, of course, prevailed as the chests were transferred from the boat to the Admiral's cabin. By the Admiral's orders the chest we had broken open was left on deck for inspection, and all hands eagerly surrounded it and discussed the kind and value of the coins. Orders were then given for our return to the head of the loch; and as we picked up our moorings the Admiral locked the door of his cabin, and it was sealed up by Captain Wright.

CHAPTER VI.

HAT night dinner was anything but a quiet meal; and when we adjourned to the smoking-room Commander Hardy's was the only pipe which did not require a match every few minutes. After a time his

silence dawned upon us, and the Admiral voiced

our notice of it.

'Bless me, Hardy!' he exclaimed, 'what's come over you? Why, I don't believe you've said halfa-dozen words since we landed. Are you dead-beat, or are you meditating some fresh employment for Captain Wright?'

'Well, no,' smiled Commander Hardy as he knocked the ashes out of his pipe. 'I'm more than satisfied with what we've recovered already, whatever the Government may be. For my part, I don't want to see the cave again.'

'What!' cried Captain Wright; 'and leave all that plate?'

'Yes,' I insisted. 'And what about the chest we left on the top of the rock? Why, I'm sure it's worth more than all the rest put together.'

'Ay,' replied Commander Hardy very gravely, 'I believe, Charlie, it is worth all the rest put together; I believe it's worth our lives!'

We gazed at him in silent and blank astonishment, and he continued:

'You remember I stopped you as you were about to tackle it with your crowbar. Forgive me, lad, if I was rough; but my belief is that to meddle with that chest means an end of the cave and of all who may be in it. As we buried the dead man I thought how often and how closely Death shadows the lust for gold, and I could not rid myself of the thought that he might be tirelessly shadowing us. What more likely, I thought, than that Slioch may not have left the sea the sole guardian of his treasure? Why was it piled on the top of the rock?

Why had the last man to seek it been killed? Was there any deadly method in the apparently confused arrangement of the chests? Try as I liked, I could not put these questions aside; and you may have noticed the care with which I examined the pile of treasure when I first mounted the rock. That examination disclosed no hint of danger, and made me hesitate to mention my yet unsupported, and indeed intangible, reasons for caution. The fifteen chests I lowered down to you before lunch were only handled after the most careful examination of their appearance and position; and, with them out of the way, I could see that whatever danger might exist was at all events unconnected with the larger chests we broke up. We then, you may remember, got access to the rest of the chests; and it was only when these were removed that the largest chest of all was disclosed. More massive than the rest, and far more strongly protected, it was the only one resting throughout its whole length and breadth entirely on the rock; and something-I cannot explain what-made me fear it. Of course,' he finished, with a short, uneasy laugh, 'our success to-day may have played grim tricks with my imagination; but, be that as it may, I for one am quite content with what we have already got, and think we should leave well alone.'

This was a new point of view with a vengeance; and Captain Wright and I urged that the unique nature of the cave put it entirely out of court. However, we could not make much out of Commander Hardy. He simply adhered to the opinion that we had already got enough to satisfy any reasonable man, and was not to be drawn further.

I retired to rest in rather an unsatisfactory frame of mind, and was fated to continue in it all next day; for during the night a strong breeze came away from the west, and by morning a heavy sea was running in the loch. There could be no question of a visit to the cave that day; so we resolved to utilise our time by opening the boxes we had secured the previous day and assorting their contents. We had a very stiff and wet pull out to the yacht, but got safely on board; and at the request of Captain Wright, the Admiral asked Captain Corbett to accompany us down to the saloon. There Captain Wright explained that he would require to take an inventory of what had been recovered, to be forwarded to headquarters for instructions; and suggested that the chests be brought into the saloon, and as each was opened an attempt be made to classify its contents. Accordingly, we adjourned to the door of the Admiral's cabin, from which Captain Wright removed his seal, and on the Admiral unlocking the door we superintended the removal of the boxes to the saloon. We turned first to the chest we had broken open in the cave, and filling the fiddles on the table, tried to sort out the different coins with which it was filled. So varied, however, were they

that a few minutes' work made it evident that if the contents of the other chests were as miscellaneous we had neither time nor patience to arrange them according to their kinds. With Captain Wright's concurrence, we therefore contented ourselves with a simple division of the coins into those of gold and those of silver. Each heap was counted and weighed, and the result headed Captain Wright's inrentory. One after another the remaining chests were opened, and each one was found to contain a more or less varied assortment of coins. These we treated in the same way; and by the end of a hard day's work we had twenty-seven bags of gold coins and forty-one of silver coins ranged along the floor of the saloon. Captain Wright entered them all duly in his inventory, and we got in the sailmaker and his assistant (who had to work hard to keep us in bags) to sew them up. They were then marked with numbers corresponding to those in the inventory, and each bag was sealed by Captain Wright, and thereafter locked up in the Admiral's cabin

When we landed from the yacht Captain Wright telegraphed his report to headquarters, and, pending his recipit of further instructions, all tacitly agreed to avoid the subject of another visit to the cave. Two days afterwards a long telegram addressed to Captain Wright arrived late in the afternoon, and in the smoking-room after dinner he handed it to the Admiral for our information. Briefly, it intimated that a gunboat would take off the coin in the beginning of the following week, and instructed Captain Wright to secure at once whatever of value was still in the cave.

Captain Wright broke the silence which followed the Admiral's reading of the telegram. Of course ary duty is quite plain; I must get what I can out of the cave, and—and I hope, Commander Hardy, I may have the benefit of your advice. I don't ask touthing more.'

My dear captain,' cried Commander Hardy, 'not ally shall I give you my advice—since you have been good enough to ask for it—but I shall right rillingly help you in all things short of interfering with the chest remaining on the rock. That, as I idiated before, I think should be left alone; but I may be able to suggest some way in which you can do so with a minimum of risk. At all events, I shall, if you wish, think the matter over carefully.

Captain Wright thanked Commander Hardy beartily, and obtained the Admiral's permission to pay another visit to the cave the next day, provided the weather proved suitable.

Nett morning broke calm and fine, and we made an early start. We secured the boat above the estimate to the cave as before, and soon had the haver made fast inside and the tackle running ite. In the same manner as before we effected our entrance, and at once started to fill sack after act with the plate on the sand. These sacks we

sent up to the boat; and by lunch-time nothing possessing any appearance of value remained except the huge iron-bound chest lying sullenly and alone on the rock.

In silence Commander Hardy and Captain Wright made a prolonged inspection of it on all sides from the sand; and on their rejoining me neither spoke for some minutes. Commander Hardy broke the silence.

'Captain Wright, I quite appreciate the fact that that chest has all the appearance of being made to contain the most valuable part of the treasure in the cave. Further, I take it that it will be impossible for you to give any valid reason for leaving it as and where it is. But my opinion, which I can neither adequately justify nor force myself to ignore, is that whoever meddles with that chest will not live to regret doing so. It is, of course, for you to decide what you are to do. To the best of my ability I shall cheerfully help you to carry out what you may determine on doing, provided I am allowed to leave the cave with Charlie ten minutes before the chest is actually touched.'

'I quite recognise,' answered Captain Wright, 'your kindness in this matter; and though I cannot follow you in your aversion to this chest being broken open like the others, I thank you very much for your consideration. Still, it is, I conceive, undoubtedly my duty to satisfy myself that I do not leave anything of value in the cave; and if you will stand by in the boat to pull me up when I signal, I propose to try to break open the chest after you and Mr Murdoch have left. I don't see that I have any alternative. Do you?'

'Well,' said Commander Hardy slowly, 'I think I do. I shall be greatly distressed if you do as you propose, and I ask you to consider if you cannot perform what you rightly think is your duty without personally forcing your way into the chest. I think we may take it that whatever of value the chest may contain will not be of such a nature as to suffer material damage by a little rough handling. Look at the contents of the other chests. You might have blown them open with gunpowder and been none the poorer. that has given me my idea. Place a small charge of dynamite on the chest, arrange that it will explode in, say, ten minutes, clear out for the boat, cast her off, and join the Admiral at lunch in the yacht. By the time we've finished you'll find me either optimistic enough to face old Slioch and his crew with you, or-well, if you prefer it, join you in a pipe.'

As Commander Hardy finished, the expression of relief on Captain Wright's face was not to be mistaken, and it did not need his voluble acquiescence in Commander Hardy's suggestion to indicate his agreement with the course proposed.

Commander Hardy must have thought out all this during the night, for he produced from a waterproof case he had brought down with him the materials necessary for the experiment. A small charge of dynamite was placed on the top of the chest, the fuse lit, and in a few seconds we were in the boat. Commander Hardy's orders to buoy the hawser, get the anchor aboard, and cast off the painter came like shots from a gun, and the men fairly jumped to execute them.

'Give way, my lads!' took the boat tearing through the water, and the echo of the order almost mingled with that of the 'Way 'nough!' which heralded our approach to the yacht. Once on board, Commander Hardy, without a word, climbed up the stays and intently gazed at the spot we had just left; while Captain Wright began an explanation of our sudden appearance to the Admiral. Then a tremendous beat that seemed to displace the very air we breathed, a terrible soundless manifestation of titanic force, pulsed through our brains. A slice of the mountain

opposite where the boat had been anchored only a few minutes before slid bodily away, and an erect array of water broke from the shore, burst over the yacht in dense spray, and fled as if in terror across the loch.

'That, Captain Wright,' said Commander Hardy gravely as he rejoined us on deck—'that is the explosion of more than our dynamite, and—The End!'

Commander Hardy was right. The bay where the boat had so buoyantly floated was blotted out, and now the foot of a mountain covered the secret of the cave!

Nor, I think, was any one sorry. We had recovered treasure which proved to be worth about forty thousand pounds without a scratch, and we all shared in the very substantial sum which the Treasury paid over to Admiral Benbow.

THE END.

THE MONTH: SCIENCE AND ARTS.

THE PANAMÁ CANAL.

RESIDENT ROOSEVELT'S recent visit to the vast canal undertaking on the Isthmus of Panamá was made at a most opportune time, for the very extensive work of preparation may now be said to be complete,

and all is in readiness for a determined onslaught to be made upon the enormous difficulties which the scheme presents. Some idea of the magnitude of the undertaking may perhaps be gleaned from the measurements of a single gate of one of the huge locks. Imagine a gate measuring fifty feet in width and seventy-five feet in height. The complete lock will measure ninety-five by nine hundred feet, and at one spot there will be a set of locks in duplicate, side by side, each set consisting of either two or three locks rising in flight one above the other. It is estimated that the amount of excavation necessary in the construction of this set of locks will be three million six hundred and sixty thousand cubic yards, and will involve the use of one million three hundred and two thousand cubic yards of concrete; while for the lock-gates fifteen thousand tons of steel will be required. One of the first difficulties was found in the extremely unhealthy nature of the canal zone, which was a veritable breeding-place of disease; but this problem has been satisfactorily dealt with by a special sanitary corps, by whose operations a plentiful supply of pure water has been provided, yellow fever practically stamped out, and malaria brought so far under control that the canal zone is now considered no more unhealthy than many of the Southern states. The problem of housing and feeding the many thousands of workmen has also been properly dealt with. engineers engaged on the work have endeavoured

as far as possible to utilise the old plant and machinery taken over from the French company; and, strange to say, a great deal of this machinery was found to be in admirable condition although it has been standing idle for some twenty years. Most of the machinery, locomotives, dump-cars, &c. have been pronounced a great deal too small by the modern engineers, who have accordingly turned them to other uses not originally intended, and replaced them by modern machinery and locomotives. A huge system for the supply of compressed air for drilling in the many large cuts of the canal is under construction, including three large compressor plants with the capacity of thirty thousand cubic feet of air a minute, and an elaborate system of pipes varying in size from ten inches diameter, for the conveyance of the compressed air to the various points at which it is to be used.

A POWERFUL PRIMARY BATTERY.

A new form of primary battery was described by Professor Carl Hering at a meeting of the Franklin Institute. The primary battery is, in theory, a far more efficient means of obtaining electrical energy than the steam engine and dynamo, because it utilises a larger proportion of the energy stored in the fuel which it consumes. In practice, however, it is merely a delusion. The fuel consists of expensive metals and acids, and the primary cell has innumerable vices which militate against its utility for anything but the feeble and intermittent currents required for operating bells, &c.; and the trouble and difficulty of looking after a large primary battery can only be adequately described by those who have experience. The battery which the professor exhibited is, chemically speaking, only our old friend the bichromate cell; its difference lies in the mechanical construction. The carbon electrode is

in the form of a corrugated plate of graphite, with a large brass terminal plug embedded in it. The rine plate is in the form of a roll of sheet-zinc amalgamated by a secret process which is said to le most effective. The porous cups are of very ngenious construction, and there are many dever devices to facilitate the handling of the alla Not the least important is the system by which the liquids may be drawn off and replaced with the minimum of difficulty. All the cells of the large battery are in fluid connection with one another through a system of pipes of such length and such small sectional area that they present high electrical resistance, and only a negligible amount of electricity is wasted through them. To give some idea of the high efficiency of the battery, it may be recorded that a single cell weighing about one hundred pounds was discharged at one hundred ampères for nearly six hours at a mean useful roltage at 184, and during the lecture another single cell was discharged at a rate of four hundred ampères without being overworked. In comparison with a standard storage battery, the professor found that for the same duty the latter reghs about three times as much and occupies about twice the space for about the same power.

WIRELESS TELEGRAPHY.

An impressive lecture and demonstration of an entirely new form of wireless telegraphy was recently gren in London by its inventor, Mr Valdemar Poulsen. In wireless telegraphy as we now know it the condition of things may be expressed very imperfectly and very simply by saying that the eathe spark occurring between two highly charged bodies gives rise to an electric ripple in the ether, sa stone dropped into a still pond will give rise to a ripple on the surface of the water. According to Sir William Preece, who was chairman at Mr Poulsen's lecture, that gentleman's invention has sounded the death-knell of spark telegraphy. Mr Poolsen likens his system to a tuning-fork giving on steady and continuous vibrations, in sharp disliaction to the series of explosions to which the but form of electricity might be compared. He dams that by his system absolutely perfect tuning a possible, so that there can be no mixing up of heaves intended for different recipients, and also that manthorised tapping of messages will be an impossibility. Moreover, he looks forward to solving the problem of wireless telephony. The reality of the wireless energy was clearly and unmistakably demonstrated to the audience, for incandescent anja were lighted without any metallic connection, opper wire was melted in mid-air, and various the striking experiments performed.

MASSAGE FOR DEAFNESS.

A dever little instrument for the cure of catarrhal beiness by mechanical means has been brought out the the name of the akou-vibra-massage instruand it is believed to be a valuable means for

the cure of this distressing malady. Hearing, which depends upon the free transmission through a short chain of tiny bones of the vibrations received by the ear-drum, is suspended when these ossicles, as they are called, become stiffened so that they cease to respond to the movements of the tympanum. In catarrhal deafness the mucus covering of these small bones is excited, and they become stiffened and no longer able to vibrate freely in synchronism with the ear-drum. The new invention provides a means of transmitting regular vibrations along this chain of small bones until, by the enforced exercise, they regain their power of free movement. The instrument resembles the ear-piece of a telephone receiver, and is operated by electro-magnets which, under the influence of the current from a small battery, set little diaphragms in rapid vibration and transmit wave-motion to the ear. It is said that the treatment is meeting with remarkable success.

PAPER FROM COTTON-STALKS.

On an area of land capable of producing a bale of cotton, about one ton of waste material in the shape of cotton-stalks of practically no value may be gathered. For some years past experiments have been made with the view of utilising this waste product in the manufacture of paper, and it is now believed that a practicable process has been realised, and from this hitherto useless material paper of all grades may be manufactured, and in addition various products such as alcohol, celluloid, and other things can be procured, it is hoped, in paying quantities. If paper-mills can be established in the cottongrowing states of South America to utilise cottonstalks in the manufacture of paper which can be sold cheaply, a service of vast importance will be rendered to the newspaper trade of the country, which at the present time suffers severely from the burden of the constantly increasing cost of paper.

RED NOSES ELECTRICALLY CURED.

Among the lesser evils to which the human flesh is heir, the possession of a red nose may be counted as one of the most distressing to its unfortunate Various causes may be assigned to the phenomenon; but this question may be charitably disposed of by simply stating that the immediate cause is abnormally enlarged blood-vessels. A German professor has invented an electric vibrator or concussion instrument which from the description appears, as it were, to punch the nose under operation hundreds of times a second with a bundle of about fifty gilded platinum points. The application of the instrument is said to cause bleeding, and there does not appear to be any good reason for doubting the statement. However, it is said that the patients are able in most cases to endure the rapidly repeated pricking without inconvenience, and one or two treatments a week are sufficient to bring the most abnormal noses back to their pristine purity and whiteness. As this desirable result is said to be attained without the destruction of the

excessive blood-vessels or leaving any scar, the patient may presumably return to those courses which caused the blushing of the sensitive member in the pleasurable certainty that if the roseate hue should once more appear it may again be put to flight with a little more electrical 'inconvenience.'

DRAUGHTS.

The deadly antagonism which exists between the fresh-air-at-any-cost enthusiasts and the nodraughters-antagonism which is kept burning principally by the difficulty of securing fresh air without draughts in ordinary rooms-is likely to be modified by a recent clever contrivance. It is well known, though perhaps not generally realised, that no open fire or gas-stove can burn in a room without carrying away large quantities of the air which the room contains. On the face of it, this state of things means only healthful ventilation, for the air so removed must be replaced from outside. Unfortunately, however, modern rooms are seldom fitted with any proper ventilator through which the supply of fresh air can find an entrance; consequently it gets in around the sashes of windows and under doors, and the result is found in those miserable, uncomfortable draughts which some people seek to exclude in various unsightly and unsatisfactory ways. But suppose, instead of stopping up the cracks under the door, the door itself be opened a few inches and the open space closed with a suitable wooden fillet. There will then remain a triangular opening at the top, well above every one's head, through which the air from outside may pass without causing any draught at all. For the cold air gaining an easy entrance in this way will well gently in instead of whistling through narrow slits, and, being heavier than the warm air inside, will sink slowly and evenly all over the apartment, pushing some of the vitiated air before it up the chimney. This extremely simple invention is called the Glassford screen, and as it is quite cheap and need not be unsightly, it should add materially to the comfort of many homes during the cold weather.

LIVING CRYSTALS.

There is perhaps nothing more striking about the revelations of modern science than its continual tendency to break down old boundaries; and there are those who believe that at some future time all boundaries will have been removed, and nature will stand revealed as something infinitely simple. The attempt to draw a line between the animal and vegetable kingdoms has long ago been abandoned, and now even the boundary between living and dead is threatened. In a striking communication by Professor O. Lehmann at a concourse of German physicians and physicists at Stuttgart, it was shown that the crystals of numerous substances show all the characteristics of life as revealed in some of the lowest organisms with which modern science is familiar. All substances which crystallise do so in

a specific form peculiarly their own, and many of these forms are strikingly like vegetable structures. Moreover, crystallisation needs a germ to start it, crystals are capable of growth, and they will also absorb substances from the surrounding medium, and thereby poison themselves, as it were, and deform their natural development. But while living things are fluid or partially so, crystals have always been believed to be solid. Now, however, Professor Lehmann has shown that liquid crystals may be produced, and about fifty varieties are mentioned. Among them we find soft-soap, which consists of innumerable soft crystals. Several chemicals, mostly with alarming names, are quoted as exhibiting very wonderful crystalline forms. Some are viscous fluids which, under the microscope, are found to consist of distinctly crystalline structures in constant motion. Another chemical is as liquid as water, but every drop is demonstrably a distinct crystal. Others even have the power of assuming the form of a chain resembling a bacterium, and sometimes these rods are of spiral form and are occasionally seen in serpentine motion. When it is remarked that the rods eventually break up and the fragments develop into perfect individuals, it will be seen that the resemblance between these crystalline structures and some of the lowest forms of life is practically complete. In any case, it appears to be impossible to draw a definite line separating the one from the other.

ALUNDUM.

A new material having remarkable abrasive properties, and considered far superior to emery, is announced as a product of the electric furnaces at Niagara. The substance is produced from the amorphous oxide of aluminium, known as bauxite, which has hitherto been considered absolutely infusible. No ordinary furnace can touch this material; but under the persuasive power of the electric arc it can be fused into a liquid mass, purified, and finally crystallised out into a substance which is practically a mass of tiny rubies and sapphires. The ingots of alundum, as it is called, are broken up by powerful crushers, and then passed through a series of rollers to reduce them to various sizes of grain. From the grains, after thorough screening, various grinding-wheels and sharpeningstones are made. Alundum is said to be considerably harder than natural corundum, to be quite free from water in combination, and to have all the properties of emery in a still higher degree.

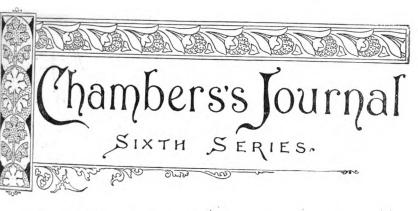

* * TO CONTRIBUTORS.

1st. All communications should be addressed 'To the Editor, 339 High Street, Edinburgh.'

2nd. For its return in case of ineligibility, postage-stamps should accompany every manuscript.

3rd. To secure their safe return if ineligible, ALL MANU-SCRIPTS, whether accompanied by a letter of advice or otherwise, should have the writer's Name and Address written upon them in Full.

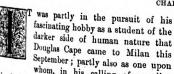

4th. Poetical contributions should invariably be accompanied by a stamped and directed envelope.

MILANESE MYSTERY.

By CHARLES EDWARDES.

CHAPTER I.

whom, in his calling of novelist, laly always acted as a potent stimulus of imagimilion. Like others, he had read about the extraculinary recent occurrences in that city, and he proposed to investigate.

In nine months five persons, including a lady, bil suddenly been blown to pieces in the city of Milan without the slightest indication of an external ware, One gentleman had exploded, as it were, a the act of purchasing a newspaper at a kiosk; mother, on the staircase of his hotel; a third, in is own bedroom, when he had but just put on his ight boot; a fourth, the very instant after he had backed the bell for his morning roll and coffee; and the lady, while she stood at the window of her teamt apartment in the Corso Venezia, dressed for reception. The lady was a notorious beauty, those character rumour had much to say. it fity-nine minutes past seven on a summer traing she waved her hand to a friend at an Troute window; and ere fifty-nine minutes and as second past seven she was shattered into Minigness before the horrified eyes of her

Could any writer of sensational fiction be prewith a more interesting mystery than these fre kindred tragedies suggested?

On his journey south Douglas came almost stately to the conclusion that the murders—for the judged them to be-were caused by a diabolical pill. He was not chemist enough to at the component parts of such a pill; but the more he thought of it the more he was conthat molecular energy compressed and let lose by dissolution in the human stomach explained No. 479.-Vol. X

No sooner was he in Milan than he called on the Cavaliere di Barese. He had a letter of recommendation to this gentleman, who was unofficially connected with the Italian secret police system. Few outsiders were better acquainted with the workings of the Mafia and Camorra, and he was known to have these cases of spontaneous combustion in hand. A frivolous newspaper had termed

The cavaliere greeted Douglas as a friend of a friend, and also (much more eagerly) as a volunteer in the campaign he had undertaken.

'No, no, no,' he said emphatically, however, when Douglas put forward his plea on behalf of the pill. 'That suggestion has been weighed and found untenable. But ecco ! Mr Cape, you arrive to me in the very nick of time, as you say it. You are sure that you have a heart for such a business? You will place yourself truly at my disposal?'

Though disappointed about the pill, Douglas was charmed otherwise by the cavaliere's reception of

'Truly and entirely, in this matter,' he answered. 'Good! Well, then, I shall tell you a little thing that I learned last night. Of those five miserables, two were at one time associated with a certain small street in this city. Andrea Guisano, the talented sculptor, who was, you will remember, annihilated at his toilet, and La Bella Banti, poor light-hearted creature! both lived for a considerable period in the Via Corta, near the Piazza d'Armi. It is not much to know, you think? Well, perhaps that is so if it was to do with only one of them; but when last night at the opera I am told by a friend that he had known the unfortunate Banti seven years ago as the golden-haired daughter of an obscure milliner in this same Via Corta, ecco! I felt the blood make a caper in my veins. My advice to you is, seek a lodging in the Via Corta, as young artist or what you will, and use your eyes and ears with discretion. Do you see?'

[All Rights Reserved.]

FEBRUARY 2, 1907.

Of course Douglas saw. He grasped the cavaliere's firm brown hand and thanked him.

'And, one more thing, Mr Cape,' said the cavaliere when they had smoked excellent cigars together and talked about side-issues, 'you must cut yourself away altogether from that which I presume even such philosophers as you and I may term the upper classes of society. Deny even me the pleasure of your company until—until you have made your discovery. There, Mr Cape! Many of my own compatriots would be so angry with me if they knew how I was confiding in you, a stranger! But you come from the land of the great Mr Sherlock Holmes, whose brilliant fairy-tales are all familiar to me. That is enough. You have a brave face, Mr Cape! I shall wish you God's luck, and for myself the felicity of soon seeing you again.'

Douglas obtained rooms in the Via Corta first with a deaf old signora named Colla, who, he learnt at the Three Stars Tavern in the street, had a passion for artists. But four days with this signora were sufficient and to spare. She was so deaf that she was useless to him. Her late husband had been a scene-painter at the Scala Theatre, and it was of this dear departed saint, and him only, that the afflicted old lady loved to prattle in whispers that were themselves alone hard to catch. She was, besides, a negligent old woman in household matters, with an anchorite's tolerance of dust and dirt.

From the Signora Colla, Douglas transferred himself to the house of Cirilo Bassano, a cobbler. He made the acquaintance of the cobbler through the cobbler's daughter Maria, a young lady with Venetian blue eyes and a plait of coal-black hair to her head, thick and strong enough to draw a wagon.

On his second evening in the Via Corta he entered the cobbler's shop, discontented both with an abrupt burst in his left boot and the futility of the Signora Colla; and Maria Bassano stood before him in a galaxy of cheap gold gauds over her blue silk and lace—smiling a welcome, moreover, of the kind the young ladies of Italy are ever ready to offer to handsome masculine youth even at the first time of seeing.

'At your service, signore!' she said blithely; and in ten minutes Douglas heard that not only would her father mend his boot, but that there was a delightful apartment upstairs which he sometimes let to strangers. 'He is very particular, my father, you must understand,' Maria explained, however, with an alluring dimple in her olive cheek. 'I am his only child, it is necessary to tell you, signore, and, as your wisdom may perceive, of a marriageable age. Therefore'—

Her toss of the shoulders and little gesture with her pretty hand, also her coquettish laugh, which well became her, carried Douglas by storm. He forgot the hapless exploded five. Maria appealed to him as human material; a heart and face, and perhaps even mind, to study for his desk's purposes—appealed irresistibly.

'Do request your father,' he begged her, 'to come and talk it over. I cannot pay very much'—this was artful—'but I am not at all satisfied with my present lodgings.'

She asked him his nationality.

'English, truly?' she exclaimed. 'Oh, then, perhaps, if you will wait a little moment. One is not disposed to be doubtful about an Englishman. In England every one is very honest and very rich; is it not so? My Marco, to whom I am affianced, cannot be expected to object to an Englishman And without question, the signore has a spouse of his own in his own country?' All this with enchanting dimples coming and going on both cheeks, and electric flashes in Maria's blue eyes.

Douglas parried the little impertinence about a spouse. He said, with some solemnity, that he was in Milan for art's sake; also, with less solemnity, he congratulated the happy Marco on so desirable a sweetheart. And, solemn again, he informed the girl that he would regularly dine and sup out, so that there might be scant trouble with him on the premises. A room having a good light and a reasonable amount of service were all his requirements. He mentioned the weekly fifteen lire that he was to pay the Signora Colla.

That won the girl.

'Fifteen lire? What extortion!' she cried; and straightway she ran and called to her father.

It was soon settled.

Cirilo Bassano was a meek-and-mild cobbler with spectacles, and pink rims to his eyes under his spectacles. A man of premature wrinkles and nervous lips, with very few words indeed, and much in the hands of his daughter. Her arguments in Douglas's interest, set forth with flattering favour, scarcely seemed needed; and so that evening Signora Colla was indulged with an eternal farewell and a whole week's rent, and Douglas took possession of his new quarters. Maria herself drew his attention to the peep of the Castello in the Piazza d'Armi to be enjoyed from his window; also, to the various highly emblazoned saints on the walls of his room. The coverlet to his bed was her own workmanship, about the time of her first communion. And-she hoped he thought her much handsomer now than as she appeared in a certain full-length portrait on the toilet-table, taken eighteen months previously.

Thus prattling about herself and the furniture, she already seemed to Douglas quite precious human material. Her ingenuous—if ingenuous—gossip diverted him so much that he was late in seeking his supper. Yet when he went he carried with him a certain astonishment that cast his mind's energies back into the channel to which he had

so lately consecrated them.

He had referred almost casually to the affair Banti of seven weeks ago, and asked her what she thought of it; and all at once she had clutched his arm and implored him, by his love of God, not to name those horrors. With the brightness of her

blue eyes all clouded as if by a storm-mist of fear, the had further conjured him never, never, never to my another word on that terrible subject either to her or her father.

'There are reasons, caro signors,' she had whispered, with the scare still all over her. 'Promise, always, to be silent about such calamities, whatever happena.'

'Why, yes, naturally, I promise,' he had responded, after hesitation.

And now, as he made his way to the Trattoria Bellini in the Via Broletto, he smiled at the absurdity of such a promise. Yet even while he smiled he marvelled why this blue-eyed little Milanese butterfly had been so profoundly moved. Reasons, forsooth! As if such reasons were to be nothing to him! Was her emotion due merely to the extreme sensibility of the Italian temperament and its unwillingness to contemplate the sad or horrible in life? Or had the Bassano family perchance some blood-relationship with one of the victims?

He ate macaroni and Milanese cutlets and drank good Chianti wine, and was of course no wiser on this head when comfortably repleted. But he determined to be in no hurry to seek a third lodging in the Via Corta.

(To be continued.)

RECENT CRITICISM OF SCOTT.

By J. H. MILLAR.

F all our novelists who are fairly entitled to be called classical, Scott and Dickens probably keep the surest hold on public favour. There is more talk about them than ever;

clubs are formed in their honour, banquets are held, and *eloges* are delivered. The chatter and the after-dinner oratory may not always be vise or well informed, but they are symptomatic. When there is so much smoke there is certain to be a fire somewhere.

Another symptom is the constant publication of books about the authors, which shows that people must exist, or be supposed by publishers to exist, sho want to read about Scott and Dickens, whether they want to read their books or not. Unhappily, this indication does not necessarily point to a pure and bright flame of enthusiasm. In Scott's case, there is one book, published nearly seventy years which contains practically everything about Sout that is worth knowing. It is a long book, a look that runs into many volumes. But it was tritten by a master of English style, by a man of fine instincts and exquisite taste, by the one erson fitted by temperament and circumstance to be Scott's biographer. Hence it is one of the most edightful prose works in its own department which English literature contains. Yet the minor works thout Scott which now issue from the press find s justification for their existence in the assumed has that this is not an age of 'leisure,' and that the world has no time to read Lockhart.

Such is the excuse frankly proffered by Mr G. Le G. Norgate for his Life of Sir Walter Scott Lindon, 1906), and, with some misgivings, by Mr Livey Lang for his Sir Walter Scott ('Literary Larg's eries; London, 1906). We confess to taning what is obviously Mr Lang's feeling, that somehow or other find time to read his Life, and that it is difficult to believe that any one seriously are for Scott who has not contrived to do so.

But that is not to affirm that these two volumes are superfluous or to deny that they are heartily welcome in their own way. They disarm criticism at the very outset by the amplitude of their acknowledgments to the great biographer, and as regards Scott himself they are thoroughly sound. They do not blame him for being what he was not. They neither reproach him with having been born too late, nor commiserate him on having been born too early. In short, they take Scott as they find him and as he was; and Scott as he was, like Dr Johnson as he was, is good enough for most men. If we are to draw a distinction, we must own that Mr Lang has the lighter touch and his work the more delicate literary flavour. Moreover, he has the advantage -a decided one in dealing with Sir Walter-of being a 'brither Scot,' forby being a Borderer.

One or two curious little errors may be noted in both books: what work is free from them? Mr Lang attributes to Scott the false quantity in Maida's epitaph, which Scott, no doubt, insisted upon fathering, but which the Life shows was unquestionably Lockhart's. The inference he draws as to the extent of Scott's classical learning can scarcely, therefore, hold good; though in point of accurate scholarship it would require a blind partisan to champion the Wizard, or indeed any contemporary of his who happened to have been bred at a Scots grammar school. Longs and shorts have never been our strong point north of the Tweed, as may still be seen from the annual reports of the Inspectors who examine our secondary schools. But Scott's knowledge of the classics and the extent of his reading in the ancient tongues were in fact much greater than is often supposed, and would appear really considerable were it not for the immense range of his attainments in more congenial branches of learning. The high importance of Latin and Greek in any scheme of education which professes to deal with subjects other than the mechanical arts it never occurred to him to question.

Mr Norgate is no less accurate in his facts, though he places Abbotsford higher up the Tweed than Ashestiel, instead of lower down. We cannot imagine, however, what put it into his head that Fairport is a thin disguise for Portobello, and that the scene of the Antiquary is laid among the fishing villages of the southern coast of the Firth of Forth. The name, no doubt, may be a translation, and Musselburgh may have suggested Musselcrag; but there are no cliffs worthy of the name between Leith and the Rhodes Farm, and the novel itself makes it perfectly clear that, wherever its scene was laid, it was beyond the Forth. Tradition, too, is decided and unchallenged for Arbroath and Auchmithie.

Criticism is matter of opinion, not of fact. It is sufficient, therefore, to express surprise that Mr Lang should find the opening chapters of Waverley 'prolix and unnecessary,' and the hope that when Mr Norgate describes Rokeby as the 'most brilliant of Scott's failures' he uses the word 'failure' in the Brummelian sense. For there are those to whom these chapters seem among the most delightful of Scott's prose writings—the 'cackle' being no less worthy of attention than the 'horses'—while the poem seems second to Marmion alone in the hierarchy of his longer poetical works.

We had imagined that Scott's fame was by this time established on a tolerably secure basis, and that there was a reasonably complete agreement among critics of all schools of thought as to his greatness. But it seems we were mistaken, for the literary critic of a leading London daily paper recently struck with no uncertain finger a note which we had not heard for long, and which we little thought to hear again. To this reviewer's eagle-eye it seems that Sir Walter is 'an author whose name is more and more dropping out of public consideration,' though it is admitted that he retains 'a compact and devoted body of worshippers who have never bent the knee to modern Baals.' 'We'-by which apparently is meant the readers of this generation-'we do not care for prolix introductions. . . . We desire a more intimate and searching psychology, with all that that science includes.' As if there were not enough of such psychology as an honest man may meddle with in Rose Bradwardine and Nanty Ewart to furnish forth a whole regiment of the novelists who appeal to 'us'! The critic then proceeds to an astounding assertion of the superiority of the Byron of the Giaour and Lara to the Scott of Marmion. Byron, forsooth! 'explores all the recesses of the human heart in a fashion of which Scott was incapable.' Scott was incapable (let us be thankful for it), and

with characteristic generosity credited Byron with 'deep-seated knowledge of the human heart.' But we are not bound to follow Scott in all his critical pronouncements, and pretend to hold at this time of day that the Byronic hero—that stagiest of all stagey puppets—is a miracle of psychological analysis.

It further appears on the authority of the same critic that Scott was devoid of 'what we call literary conscientiousness.' 'He was not an artist in the proper sense of the term.' 'His style was of the easy go-as-you-please description.' Both his poetry and his romances suffer from the same fault—the entire absence of critical revision.' Scott has been 'superannuated' by the 'lack of artistry in him.' 'Some of us who care for form are irritated by Walter Scott.' Some of us who care for literature are irritated by Walter Scott's censor. Scott 'lives no more for the present generation' because he defective in 'style,' if it is by virtue of style that authors live.

The cat is now out of the bag, and a sufficiently mouldy and venerable animal she proves to be. What is all this but the dreary old cant about Sir Walter's 'style' for which, most unfortunately, Mr Stevenson gave the cue to a number of writers conspicuously inferior to himself? Scott did not trouble to play the assiduous and meticulous ape to any one. But his style in point of vocabulary and diction will bear comparison with that of the most industrious nigglers who ever subjected their mosaic to 'critical revision;' and, whatever its demerits, it achieves its object and produces the effect aimed at, which is the great and essential thing about the means to any end. That his rhetoric, when occasion demands, is superb not even the dull ear of a London critic can probably fail to recognise. As for the talk about psychology, Mr Carlyle played the part of devil's advocate on that point many years ago, and no modern successor is likely to improve upon his effort in special pleading. Perhaps the Sage's stern view might have been modified but for the mysterious miscarriage or neglect of a letter addressed by him to Sir Walter, on the strength of his intercourse with Goethe. In any event there are no signs that posterity has ratified his familiar strictures about fashioning characters from the skin inwards. The tendency of present-day criticism is all, we think, in the other direction; and the isolated instance from the metropolitan press to which we have directed attention merely serves to emphasise what less antiquated persons than the critic of the Daily Telegraph would never have dreamt of disputing. His remarks may be dismissed (with a caution) to the later Victorian section of the museum for antediluvian curiosities.

THE LORD OF THE MANOR.

By FRED M. WHITE.

CHAPTER XI.

HERE was something very swift and dramatic about the whole business. Castlerayne's face was white like that of his sister, but the expression was not the same. His mouth was hard and cruel, his lips pressed

together with a fine simulation of firmness; he had never been really firm in his life, though he looked it now. He stood there with his back to the fireplace, slim anger in immaculate black-andwhite, with the fine carving of the overmantel for a background. It was no setting for the vulgar emotions—there could be nothing like violence.

In front of him stood Aunt Gertrude, with her slim white hands outstretched tremblingly. A ray of light from one of the lamps shone on her face. For background she had the oak-panelled wall and a couple of sombre brown-and-yellow portraits by Beynolds. Her breath was coming fast between her parted lips.

What does all this mean?' May asked. 'What has Aunt Gertrude done?'

'We will not discuss it,' the stern figure by the freplace said. 'As I informed my sister just this moment, the dinner-gong has sounded.—One should herer keep servants waiting, Gertrude. Let me give you my arm.'

It sounded very terrible and very grand, no doubt. It was the dignified conduct of monarchs and statemen in the hour of stress, the kind of thing one reads in the Grandisonian class of novel. May bit her lips quite in the modern way.

There will be plenty of time to explain after-

dant Gertrude came out of her waking dream.

The mere suggestion of food filled her with loathing,
it she took the proffered arm and clung to it.

In his secret heart Mr Castlerayne was greatly leased with himself. He was about to vindicate the outaged honour of the family without saying ariting calculated to lower the dignity of his position. He chatted affably to May; he smiled samply on his elder daughter. His face grew serre when the dessert reached the table and the sensit in his direction.

les you are expecting me to speak,' he said. His voice was quite smooth; the lamplight gave dainy to his face. Also, the lamplight fell in faing shafts of light on the artistic confusion of full purple grapes and ruddy peaches—old silver ad glass, ruby wines, and the flashing cut-glass decanters. Approving ancestors lined the walls which was a subject to the speaker. After all, is entirely a matter between your—my sister

and myself. She has chosen to take certain steps which I entirely disagree with. I will not blame her; no doubt she has acted according to her lights. It was not the line of conduct I expected. Still, so long as she remains a guest under my roof'—

A moan of pain came from Aunt Gertrude. She sat there with folded hands, meek and quiet as a child.

May rose and kissed her. May understood.

'What is the meaning of all this nonsense?' she demanded.

It was the banal note frequently so destructive of the higher flights of dialectics.

'You had better ask your aunt,' Castlerayne retorted somewhat feebly. 'During the short time that she is likely to remain under my roof'——

'Are any of us likely to remain here long? I am sorry to be rude, father; but this is—is disgraceful. Oh, I know exactly what you are alluding to. But for Aunt Gertrude, old Craggs could not have fought that action of his. She lent him the money. In similar circumstances I should have done the same thing?

'You would have done—the same—thing?' Castlerayne faltered. 'My child!'

'Indeed I would. There would have been no action had you listened to Mr Summers. He told you that Craggs was merely fighting for the rights of the hospitallers, for their very existence. There are people yonder who have worked for us all their lives. It has been an understood thing that we provided for their old age, and now we leave them to go to the workhouse. Oh, the shame of it! the disgrace of it! And because Aunt Gertrude has stripped herself to preserve the good name of the family'——

'What has she done?' Angela pleaded. 'Oh, what has she done?'

'What has she done?' May echoed scornfully.
'Oh, nothing. She has given up her whole life to our father and ourselves. For our sakes she has remained single; she resigned the man who loved her because the family dignity called for the sacrifice.—Aunt Gertrude, I must, I will speak.'

'It were better I had died years ago,' Miss Castlerayne sobbed.

'It would have been a very sad day for us,' May went on. 'We never went to school for the simple reason that there was no money to send us; and yet we are quite well-educated girls because Aunt Gertrude taught us all she knew. No mother could have been more kind and tender, more thoughtful for our happiness.'

'It is all the more inexplicable,' Castlerayne remonstrated. 'that she should ruin us now.'

A bitter laugh rose to May's lips, but she crushed it down.

'Has she ruined us?' she asked. 'I may be dense, but it seems to me to be quite the other way about. I understand that when Aunt Gertrude came to us she had nearly five thousand pounds of her own. That was the provision for her old age, the least that a gentlewoman could live on. Where has all that money gone? It has gone to pay our shameless debts; it has passed into the pockets of poor people who trusted to the word of a Castle rayne for payment. Little by little that money has vanished. A good deal of it has gone to cigars and vintage—clarets, I should say.'

The head of the house winced perceptibly. He murmured something as to the modern daughter and her ways. But the Grandisonian manner was no longer there. Then, to the surprise of everybody, Aunt Gertrude rose. She was trembling from head to foot, her face was very pale, yet her voice was firm and sweet.

'Hush, May,' she said; 'you are forgetting yourself. It is so good of you to take my part; but
you are going too far. I have done wrong in your
father's eyes; he has asked me to look for a home
elsewhere. I have found it. For some time past
I have looked for something of the kind. It was
wrong of me'—

'It was absolutely impossible of you,' Castlerayne

Perhaps so, Rayne. Still, I looked upon the welfare of the hospital as a sacred duty. I knew what was going to happen. That hotel suggestion was a hateful one; but, nevertheless, I welcomed it because I saw in the scheme a way to save our poor people. So long as you, as lord of the manor, had the final word, the scheme was hopeless. But Craggs put a different complexion on it altogether. He proved to me that the Common belonged to the hospital. He could do nothing without money. I lent him the money. I would do it again tomorrow. I am not in the least ashamed of my action. From your point of view, Rayne, I have struck a blow at the family honour. You have told me quite politely that I am no longer a member of your household; you are good enough to regard me as your guest until I can find a home elsewhere. That home is found. I shall not trouble you with my presence after to-morrow.'

'Oh, this is out of the question!' Angela cried.
'What does it matter what Aunt Gertrude has said and done? She is still Aunt Gertrude to us. The Towers would not be the same place without her. If she stays here'—

'She has ruined us,' Castlerayne protested; 'and she has done it deliberately.'

'We were ruined in any case,' May protested.
'My dear father'.....

'The discussion is getting painful,' Castlerayne said with much dignity. 'There is nothing to be gained by continuing it. I hold very strong views in the matter. As a man of determination, I

could not possibly regard your aunt's conduct as

The speaker paused and indicated the door with a fine gesture. It was a signal that the conference was at an end. Hot words trembled on May's lips, but she restrained them. It was an outrage and violation of all the sacred laws of consanguinity. Aunt Gertrude's transient dignity had vanished; she was crying softly now. She passed in the direction of the drawing-room, trembling and marvelling at her own temerity. She did not look in the least like a martyr; but nevertheless she was the stuff that martyrs are made of. She was sorry; she was hurt and grieved; but she had no regret for her action. She sat in a big arm-chair and suffered the girls to make much of her.

'You are not going away,' Angela said vehemently. 'We will detain you by force if necessary. What should we do without you, auntie? All the same, I'm sorry you helped that dogmatic old Craggs to get the best of us.'

'I had to,' Aunt Gertrude sobbed. 'My duty lay plain before me. I could not die happy knowing that my dear hospitallers were in need. They are provided for now that the hotel scheme is accomplished.'

'It isn't accomplished, and it never will be accomplished,' May declared. 'No hotel is going to defile the serenity of our own dear old common. All the same, your great sacrifice has not been in vain, auntie. The result will be exactly the same thing, and the sun of prosperity is going to shine on us again.'

'More of May's enigmas,' Angela laughed. 'And when I ask her to say what she means she tells me to wait and be patient. As if anybody could be patient at such a time as this! Auntie, do you know what this wonderful secret is?'

'Indeed I don't, dear,' Miss Castlerayne said, wiping her eyes on some faded yellow square of lace miscalled a handkerchief. 'May is too clever for me. All I know is that the fate of the hospital is saved, and we can ask Mr Warrener to help us with every confidence that he will not lose his money.'

'Mr Warrener!' Angela exclaimed. A spot of crimson tinged her cheeks. 'I should like to know what Mr Warrener has to do with it.'

'You will know all in good time,' May laughed.
'Strange that our lives should be so bound up in the emollient!—Auntie, you were going to say something.'

'I was alluding to the hospital,' Aunt Gertrude resumed. 'There will be money for each of the houses there now, enough to keep the poor people decently and in order. Unless your father changes his mind I could not remain here. Don't interrupt me, or I shall break down again. The handker chief belonged to my grandmother. It is old Brussels. One of the houses in the hospital is vacant; it is furnished, as you know. With a cottage like that and a few shillings a week it

would be possible to live. Fortunately, my needs are simple. I can quite understand my brother's feelings; I can quite sympathise with his point of view. I have sinned beyond redemption, and he could not tolerate me any longer. Therefore, as lam a poor member of the clan, for the time being

I am going to become a hospitaller. I take up my abode there to-morrow. It is no use protesting, my dears; my mind is made up. And I shall have the company of Craggs to fall back on. I am really fond of Craggs.'

(To be continued.)

JOHN CHINAMAN AND HIS SECRET SOCIETIES.

By ONE WHO KNOWS HIM.

HE appalling ignorance existing about the Chinaman amongst large sections of the English population, evidenced by statements widely circulated and almost as widely believed during

the course of the recent General Election, induces me to hope that some endeavour to remove that ignorance, on the part of one who has had peculiar—in some respects unique—opportunities of becoming acquainted with and studying Chinese life on its social side, may not be unac-

Their customs and methods of thought are the results of a civilisation old before that of any ensing Western nation began, and should suggest a least the possibility of their not being inferior to our own. But such an idea does not enter, and appamaily never has entered, into the minds of the arerage Westerner. 'Chinese' has become with him a smonym for everything odd, bizarre, and unreasmable, and the Chinaman a personality pour rire, or worse. In particular, the moral side of his character is singled out for abuse and reprobation. In the eyes of those who, perhaps, never saw him in the flesh, and who only know him by pictures which are generally caricatures, he is a creature sarely to be ranked as human-immoral and

Over twenty five years of close and constant conbut with Chinamen and their families in their own and in others where they abound, under circamstances enabling him to gain an insight into heir character, manner of living, and modes of thought, entitle the writer to speak with some unhority about them.

The superciliousness with which we Westerns, or some of us, regard the representatives of the most accent civilisation existing in the world, merely because their ways are not our ways and their moles of thought not our modes of thought, is markable, and would be amusing if it did not igne something worse than self-conceit. It is true Last this picture of him has been overcoloured and taggerated of late for political purposes; but the ber fact that such overcolouring and exaggeration bould be accepted as a true picture shows that it ra in accordance with already prevailing popular Milion Yet what is the real truth? Judged by conduct—the only true test in such a matter—it the working classes-and it is with him I chiefly deal in this article-may not give points in morality to his much-lauded and petted brother in Christian countries.

'In daily life,' says Professor Douglas, who did not take his information from the daily papers or political leaflets, 'the Chinese are frugal and industrious. Their wants are few and they are easily satisfied.' They are, moreover, 'sober.' 'Spirits'-they have no wine-'have no attraction for them.' 'They live almost entirely on rice and vegetables, to which they add sometimes small pieces of fish or meat.' They are, therefore, practically vegetarians and total abstainers; yet it would not be a rash assertion to say that by thousands and thousands in this country they have been and are regarded as drunkards and unclean. To opiumsmoking they are, it is true, much addicted, but their indulgence in this respect has been grossly exaggerated. All these things are well known to those who have had personal experience of life amongst the Chinese or who have cared to search the truth from reliable sources. For my own part, having been in close contact with Chinamen for over a quarter of a century, I can confirm every letter of the above, and add fresh testimony in support of his character.

In the first place, not only is he 'frugal, sober, and industrious,' as stated above, but in a remarkable degree trustworthy and reliable in matters of business. During all my dealings with him I can conscientiously say that I have never been 'sold' by a Chinaman. As a rule, his word can be taken in business transactions, and he is more truthful and trustworthy than the average European. In his domestic relations, too, there is much to be commended. He is not only hard-working, but makes a good and kind father; whilst, in the matter of immorality, during the long period of my connection with him and his surroundings no instance ever came to my knowledge of the gross vices commonly attributed to him such as it has been my painful duty to become acquainted with during a comparatively short period of practice on the Home Circuit. But on this point, as it is one which has been brought prominently into dispute at the present time, I should like to quote the opinion of one who is able to speak with more authority, if not more has be doubted whether the despised Chinaman of | for many years Captain Superintendent of the

police at Hong-kong, Registrar-General, and Colonial Secretary. In a letter addressed to me last year he states:

'In reply to your questions concerning the morality of the Chinese, I confine my remarks to the class from which labour emigrants would be taken, generally called the coolie class. My experience, ranging over twenty-nine years, leads me to the conclusion that the cases of gross immorality are few. Their marriage system is based on payment by the intended husband of a dowry to the bride. It is not, therefore, the custom of the labouring classes to marry young. Another custom is that the wife should reside with the husband's parents, to attend to them in their old age. Hence it often happens that the wife is left whilst the husband is at work. In Hong-kong the male European population is to the female as four to ene; Chinese males to females as five to two. Emigration from China to British colonies has been going on for many years. In 1842 there were about two thousand Chinese in Hong-kong; now there are about two hundred thousand. Singapore and the Malay States also owe their prosperity mainly to the influx of the Chinese. The emigration of coolies is subject to stringent laws that are binding on all British vessels, and every precaution is taken to avoid abuses. Coolies make very good hard-labourers, being early risers, hard workers, and remarkably abstemious. A drunken Chinaman is a rare sight. Every Chinese trade has its guild. This extends even to the street urchins who act as porters to purchasers at markets. The guilds or anions have strict laws and various subdivisions of headmen. Any ill-treatment of members of a union would be followed by a strike unless compensation were paid. When in their various callings Chinese are overlooked by Europeans they invariably do their work well and with great intelligence. They are amenable to discipline, and when properly treated can readily be trained to any class of work.

In short, their worth as labourers is undeniable, and it is the virtue of the coolie in this respect, rather than his vices, which is at the bottom of the odium in which he is held by his fellow-labourers in other countries, with whom he is sometimes brought into competition. That, no doubt, accounts, and not unreasonably, for his exclusion, except under peculiar restrictions, from the labour markets of Australasia and the United States, where, if admitted freely, he would soon underbid the white man and reduce his 'standard of living,' as the phrase goes. In South Africa, where he is now objected to, such conditions do not apply, his work there being such as no white settler would undertake. As to its conditions amounting to 'slavery,' the charge is preposterous. They are mild compared to those under which he has been trained and brought up; and as every coolie belongs to some secret society, woe betide the official who should attempt any injustice on him. There would be a rising at once, their trades-unions being more powerful than those of England.

'But what of the opium-smoking and the degradation which it entails, mental and bodily?' I hear some reader exclaim. Well, I have already said that the charge against the Chinaman-the average Chinaman-in this respect has been greatly exaggerated. Terrible examples of the evil effects of over-indulgence in the drug are, of course, to be found; but, as a rule, the Chinese labourer takes his dose in moderation. Whilst with them, as I frequently have been, cutting jungle, I noticed that each, after his work, smoked a pipe as a remedy against the deadly miasma arising from the freshly cleared land, and there is no doubt that the plant used in this way is a blessing to the toiler, and not the curse which it is represented to be by those who have not visited the East. The whiff of opium to the Chinese coolie is, indeed, what the draught of beer is to the English worker, and, being indulged in with moderation, not half so injurious. If those gentlemen who spend so much time and money in attempting to prevent the Chinese from smoking opium would pay more attention to regulating the evils which exist at home, it would be more conducive to the health and morality of the United Kingdom. Having tried the effects of opium myself medicinally, I am able to speak as to its value as a febrifuge. I shall never forget the feeling of rest which it spread through the frame, following upon the passing away of feverish symptoms through the opening pores of the body. One Chinaman in ten thousand may, perhaps, exceed; but the generality, I can vouch, are sober and hard-working, only indulging in a pipe in the same manner as an English labourer might indulge in a glass of beer. It is said that the habit, once acquired, can never be broken off. That may be so in some instances. All I can say is that I smoked it medicinally for some time, and when the necessity for it passed away I had not the slightest difficulty in discontinuing the drug.

The saying of a popular writer that

East is East, and West is West, And never the twain shall meet,

though exaggerated, no doubt contains this much of truth, that the modes of thought are so essentially different in each instance that it is difficult, almost impossible, for the one civilisation to understand the other. The points of difference are almost universal, pervading habits, politics, morals, and religion. Yet, underneath the apparent antagonism, a keen observer may trace some uniformity of principle, some common basis of morals and beliefs. The opinion of the Chinaman, however, which exists with the average European is that his habits, not according to our own, are vile, his politics topsy-turvy, and that as regards religion and morality he has none. I have already said something as to his morality; for his religion, judged by its effects on his conduct, it may, I think, well compare in virtue with the practical Chris-

unity embodied in the lives of the average church or chapel goer in this country. If the religion of the Chinese is not one of dogma, it affects their lives. It makes them good children and good parents by inculcating filial piety, so that, as the writer I have before quoted observes, 'in the ordering of a Chinese household there is much that might be imitated with advantage by European families.' This has certainly been my own experience. That the Chinese have no religion is untrue. On the contrary, they have rather a superfluity, and have no objection to the entertainment of new beliefs, provided their dissemination does not outage their hereditary prejudices or threaten their political constitutions. It was the fear that such night be the case in the design of the Christian missionaries, and especially of the Jesuit propaganda, which led to the fanatical outbursts of which we have heard so much. Otherwise, the bissions might have pursued their object in peace, with as much toleration as that extended to their native religious systems - Confucianism, Taoism, and Buddhism—which now exist peacefully side by

The truth of this representation is illustrated in the history of the recent Boxer rising, the origin of which was based on spurious patriotism and m the desire to clear out the 'foreign devils' nther than on any inherent dislike or hatred to the Christian faith. This I gathered from Chinese informants, who certainly thought their countrymen, in massacring Christians, were performing a meritorious action. And that all missonaries, Protestant and Roman Catholic, suffered dike is attributable to the fact that the average Boxer was unable to distinguish between one set of rigionists and another. All Europeans and Amerias were identical to them, very much as all reliev men would appear to us. On these grounds be intolerance of the Boxer is intelligible, if not emable. The worst feature in his 'methods of urharium is that he did not confine them to the tale missionary, but extended them to women and ln this, however, he followed the praccommon amongst Eastern and, till comparatively beat times, amongst Western nations.

But when I state, from impressions derived brough personal intercourse with Chinamen, that le Boter fanatics were actuated by a spurious Athicism, I use that word for want of a better. The Chinese have, as a rule, no patriotism in se alstract sense. Their action in this matter 'a prompted only by a desire to relieve themthe personally from the prospect of submission oriorign yoke: the yoke of the foreign devil, the rast majority at once fear and hate. ar the rast majority, because I do not believe be the case with those brought into contact the European settlers, French or English, a liceg-kong, Shanghai, and other parts. With then cordial intercourse is the rule, and in all would intercourse is the rule, and in settlements educated Chinese are always

glad to welcome Europeans to their clubs and festivals, and are invariably hospitable and polite.

It was during a residence in Burma in 1901, whilst engaged in defining the boundaries of certain jungle-lands, that I was able to study the habits of the Chinese so far as I have described them -their opium-smoking and the like-as well as to gather my impressions as to the true character of the Boxer rising. For the purpose of my visit I had hired eighteen Chinamen to build a fence and clear the jungle on the line; and whilst working with them myself, in the cool of the morning and afternoon, I had frequent opportunities of conversing with the two leaders of the gang. They spoke in 'pidgin-English,' and what I have above recorded is a summary of our conversations. Muddling up the European missionaries all together-Anglican, Roman Catholic, Wesleyan, American Baptist, and the rest-they were firmly of the belief that the missionaries were all in league to prepare the way for the seizure of their country by the 'foreign devils;' and their indignation was specially aroused by the fact that if a Chinese convert was arrested by the police and brought into court, the missionary claimed a seat by the magistrate.* The 'foreign devils,' thus seated, would openly threaten the magistrate with an appeal, if necessary, to the Consul, and with pictures of the advent of the fleets of foreign nations, in the event of 'justice' not being done -that is, of the convert not being released! How, they asked, should I like to have a Chinaman sitting with our magistrates in our courts and interfering with their judgments? And, in truth, I found it difficult to answer them. Moreover, they averred, and I fear not without some justice, that in many instances known bad characters pretended to be Christian converts, hoping by this means to escape the punishment they deserved.

Such being the evidently sincere belief of the more ignorant portion of the Chinese population, of whom my informants were representative, it was no wonder the Boxer movement gained so much force. Its leaders no doubt, being men of a higher class, were aware of the exaggerations on which the belief was based, but nevertheless made no attempt to correct its error. On the contrary, they encouraged it, fully persuading their followers that little by little portions of their country would be filched by the 'foreign devils' under the excuse of compensation for some harm to the missionary, and that then they and their families would personally suffer.

I have already said that every Chinaman, or at least every Chinese labourer, belongs to a secret society, and that he is by no means the helpless and unprotected individual which humanitarians

^{*} I have only heard of this being the practice with Roman Catholic missionaries. The Protestants seem to have been less exacting. The Chinaman, however, cannot distinguish the one from the other.

at home represent him to be. This fact was particularly and forcibly brought home to me many years ago when it was my lot to act as standing counsel for one of these bodies, with which China may be said to be honeycombed, so numerous are they. Their history is difficult to trace, but they no doubt had their origin and raison d'ètre in the political and administrative corruption which has been from time immemorial the marked feature of Chinese government. All the governing classes are corrupt, from the highest mandarin down to the smallest 'one-button magistrate.' Their pay is a delusion, and so they traffic in bribes. The consequences of this are not far to seek. 'Justice,' as it is called, goes to the highest bidder, and is but rarely meted out to those most in want of it—the poor and needy. This, however, is the result of unenlightened administrative methods rather than of inherent racial vice; and the establishment of secret societies, with their secret tribunals, must be regarded as an endeavour on the part of the people to obtain for themselves, though unconstitutionally, the justice and redress withheld from them in the established courts. Thus regarded, though indefensible from a legal point of view, they are a testimony to the moral instincts of the people rather than the contrary.

In this way they assimilate to some of the European Fehmic associations of the Middle Ages, and, like them, have attained to such influence as to form a kind of imperium in imperio. The heads of such guilds arrogate almost despotic jurisdiction and deal out a rough kind of justice on their own account, not stopping at any kind of violence or even capital punishment if they think it necessary. The Chinese secret society, therefore, is not only a trades-union, but an association for the protection of its members all round, possessing an administration of justice (so called) independent of the national machinery for that purpose, from the decisions of which it forms a sort of court of criminal appeal. Often has the victor in the former been condemned in the latter, his sudden disappearance bearing silent but eloquent testimony to the fact that 'justice' from the vanquished's point of view has been duly executed. His dead body found in the river or elsewhere, with no marks of wounds or signs of violence, excites no surprise in the minds of the finders. There is no need of an inquest, as with us. So necessary in the eyes of the populace have these organisations become to their protection, and so dear, one may say, are they as quasi-national institutions, that they exist not only within China but wherever Chinamen in any numbers fix their home; though experience of the uprightness of British rule is gradually impairing their influence under the English flag.

The particular society with which I became professionally connected was called the 'Shortcoat Society,' and my acquaintance with it began in Burma, where I was engaged as counsel in litiga-

tion proceedings in the Rangoon courts arising out of disputes relating to timber rights in the Burma forests. Burma was then in a transition state. Sir Arthur Phayre, who ruled the province, was attempting to introduce justice and evolve order out of chaos in lieu of Burmese rule. The courts were generally presided over by officers selected from the Indian army, new to the work and ignorant of the rules of evidence, but for all that wonderfully efficient; and it is but justice to say that I never heard a native utter a word against them for corruption or bribery or in any way doubt their absolute honesty. Hence my friends the 'Shortcoats' had no quarrel with them or dissatisfaction at their proceedings. Their grievance was against a kindred society named the 'Longcoats,' with whom they had been at feud from time immemorial. At the time of my visit their animosity culminated in a free fight, in which no less than twelve or fourteen of the combatants were killed and a very large majority wounded. In the inevitable law proceedings which resulted from this bloody encounter I was engaged by the 'Shortcoats,' and was fortunate enough (as they considered) to do them some service. Hence my favour with them and the confidence with which I was admitted into their secrets. They were a powerful society, having ramifications everywhere, and numbering, it is said, over a million members. From their headmen I gathered 'that the origin of these societies went back to the accession of the Manchu Dynasty. These foreign conquerors filled the courts with Manchu officials, who became so corrupt and venal that to the poor justice was practically denied. Consequently, the Chinese appear to have formed a kind of imperium in imperio through their secret societies, which have spread all over the country. They hold their own courts and dispense a rough kind of secret justice.' There does not appear to have been any close amalgamation between the pure Chinese and the ruling Manchus. One of the conditions on which the latter obtained the throne was that no 'small-foot woman' should ever be compelled to enter the royal harem. Consequently, one of the channels by which the two dynasties might have been united has been

Members admitted to the societies are bound by the strictest vows, and betrayals of secrets are unrelentingly punished. The culprit 'disappears,' executed in a novel and ingenious manner. He is generally kidnapped and taken to some cellar or secret place, usually under a joss-house. Here he is drugged, wrapped round with blankets or rugs, and placed upon a table, where he is pounded with the elbows until his internal organs become bruised, but in such a manner that not a mark or sign of ill-treatment appears on the surface of the body.

As an instance of the protective power of these societies and of the benefit of belonging to them, from a Chinese point of view, I may give an instance which fell under my own observation. It

is well known that the Chinese are inveterate gamblers. They bet upon everything; and though there, as here, street betting is prohibited, it is still carried on and I was once retained to defend a man arrested in prosecuting this industry flagrante idicto, with the paraphernalia of his profession, which he kept in a belt round his waist. Being lought before the magistrates, he gave for his defence that it was an affair got up by the police, and that the belt never belonged to him at all; and when, at the second hearing of the case, he vas ordered to try it on, sure enough it was found to be too short by a couple of inches. Policeman after policeman tried to make it fit by pulling and tugging, but all to no purpose, and it ended by the prisoner being discharged. As I was leaving the court I asked the superintendent of police how it was that he had not had the belt tried on at the first hearing. He declared he had never thought of it. It had been taken off the man at the time of his arrest, and he could not really understand it. His eyes, however, would have been eread if he had known what I subsequently found on-namely, that the magistrate's clerk was a member of the same secret society—a brother 'Shortcat'-and had charge of the exhibit. By a sign to the friends of the accused, he suggested that I should be instructed to ask for an adjournment. In the interim he caused the waistband to be shortened by two inches, and that so cleverly that it was impossible to discover the fraud !

Though in this instance the defence was fictitions, it by no means follows that it was an aleard one, for I subsequently became aware tan it was no uncommon thing for the police to connive at the doings of gamblers on the soment of a regular douceur; and that when has was not forthcoming the policeman had his trenge by prosecuting the defaulters for some of tace, or, when there was no offence, inventing the In referring here to the police I do not, of conse, mean the higher class of European officials

-they were above suspicion—but the native underlings. These entered into collusion with the gambling dens, occasionally making a few arrests to 'save their faces' and create confidence with the 'Sahib Inspector.' Often those arrested were not the guilty parties; but, for a consideration, they were induced to plead guilty for the good of the

Another crime for which members of the society were frequently indicted was illicit distilling and the smuggling of opium. Sometimes a dozen or more of the guild were arrested on this charge by the police. Then the culprits would be numbered off in the dock, and I was very often instructed that certain numbers were guilty, and would confess. A hint was given to confine my crossexamination to the defence of an alibi for the others. As Chinamen are most difficult to recognise, and as the police were generally satisfied if they obtained a conviction which would look well in the reports, those who pleaded not guilty generally got off. I could never understand, however, why I was to confine my defence to a few, until I discovered that the society kept a certain number on their books who undertook, whenever required, to plead guilty for the benefit of the rest, on the understanding that if they were condemned to imprisonment their families should be well supported till their release.* Indeed, it is no uncommon thing in China for an innocent person to undergo the penalty of a guilty one for a consideration, though I never knew of an instance extending to capital punishment; yet I have been told that such has been the case. To the average Chinaman, however, death, unless it be a lingering one, has no terrors, and I can readily believe in the truth of my information. For punishment by torture, however, it is difficult to find a proxy, and this is, perhaps, the reason why it is so commonly inflicted in China; it prevents collusion and ensures the punishment of the condemned. Whether he be guilty or not is another matter.

A GIGANTIC IRRIGATION SCHEME.

By MARY SPENCER WARREN.

MERICA is a country of big things; but probably a scheme which has recently been set on foot is one of quite unusual magnitude even for that go-ahead country. Every one

is conversant with the fact that the population of the United States has gone up by base and bounds, and that cities and towns have inreased with wonderful rapidity. But still there the millions of acres of land uncultivated and un-Imital, and there is room for countless thousands of Much of the land was, until quite recently, defined to be incapable of cultivation; now, howttr, the ingenuity of man has devised the means of

overcoming all obstacles, and so no less than sixtymillion acres of land are to become fruitful soil by means of a gigantic irrigation scheme, the greatest the world has ever seen.

Major John W. Powell was the scientific pioneer of the movement, which the Government took up in a practical manner; and in 1902 the entire plans of the capable engineers and surveyors who had made themselves masters of all technical details were laid before Congress, an Act being passed whereby the great work could have an immediate commence-

^{*} The tariff was settled: thirty dollars a month for simple and sixty for rigorous imprisonment.

ment. Congress also provided that a certain amount of funds derived from sales of land be set aside for preliminary reclamation purposes. The scheme takes in thirteen states-namely, California, Oregon, Washington, Idaho, Montana, Nevada, North Dakota, South Dakota, Colorado, Utah, Nebraska, Kansas, and Wyoming. The territories are Oklahoma, New Mexico, and Arizona. A number of consulting engineers were at once appointed to take service in the various states, each with a large staff of working engineers and labourers under his control, and it was agreed that the chief engineer should visit regularly all working centres, and periodical staff-meetings be held, when the accumulated progress might be gone into. Already nearly two million acres of land are being actively worked upon, canals cut, dams erected, wagon-roads made, bridges put up, tunnels driven, &c.; while practically measurements have been taken of the greater portion of the entire area, and estimates submitted to the Secretary of the Interior at Washington, many of which have been passed. In the years 1906-8 as much as thirty-eight million dollars will have been spent on the work, ten million dollars of which is already invested.

In order to reclaim this land and convert it into fruitful soil, the courses of rivers must be diverted, and the water of some of the great lakes must be carried across to points where it is wanted; and, what is also one of the main features, enormous reservoirs must be constructed in which this water can be stored. A further scheme is the retention of flood-water both in moderate and torrential streams, and, of course, the proper diversion of such to meet requirements. The Salt River, the Colorado River, the Milk River, the Arkansas River, the American Falls, the vast St Mary's Lake, &c. will all contribute largely to the irrigation scheme, the stupendous nature of which it is impossible for the lay mind to comprehend.

Certain adjacent portions of this great western country are, of course, already under cultivation, producing large crops of wheat, barley, and oats, while here and there are large almond industries. Each and all of these will greatly increase in value, and when the arid soil is thoroughly watered, trees bearing apples, peaches, almonds, olives, plums, oranges, lemons, and all sorts of luscious tabledelicacies will flourish exceedingly. The possibilities connected with this work for engineers, labourers, tillers of the soil, practical farmers, and gardeners are enormous, and literally hundreds of thousands will be employed in transforming the face of the country. Add to this the railways and the various industries and occupations which follow all large or small settlements of people, coupled with the vast amount of territory over which these settlements stretch, and the statement that the scheme means the support of twenty millions of people will not sound so visionary as might be thought.

An important question which will immediately

occur to the reader is: How is the land to be obtained by the would-be settler? The United States is offering very easy terms; but it must always be borne in mind that Government preference is very properly given to Americans. This seems to promise a great future to a people who have already plenty of work, but would-be settlers from other countries are not prohibited from participation; the one preliminary condition, however, being that the alien must become a citizen of the States, this being quite easy of accomplishment.

Then land can be obtained in allotments of from forty to one hundred and sixty acres. There is no charge for the same beyond the usual land-office fees; but there is a water-charge running from three pounds to four pounds an acre in accordance with the situation of the land. This is intended, of course, to cover the cost of irrigation, and when once paid is paid for ever. Moreover, the Government is spreading out this water-charge over a term of ten years, so that the entire sum can be paid in annual instalments, with no extra payment for interest. When the final instalment is paid the tenant acquires an absolute right to the land.

As the scheme progresses, the Government is putting, and will put, all moneys paid for land into the Reclamation Fund for carrying on the remainder of the work; so that, enormous as the undertaking is, and costly as all engineering work must be, the Government will not lose anything at all on the project, and will gain appreciably by the import of good citizens, with added industries. An immense recommendation is the fact of the very healthy climate where these lands are situated. Most of the settlements will be about four thousand feet above sea-level, with a dry, sunny climate and a fairly equable temperature. Snow, which falls so heavily and lies so long in some of the states, never there exceeds a depth of three or four inches, or lies longer than a few days. Truly, this is a new awakening for the great western country, and it is being pushed forward with a zeal and enterprise typical of the nation conducting it.

One outcome of the enterprise-perhaps not altogether welcome to its originators-is a case argued in the United States Supreme Court, the issue of which will affect in a direct way the future of irrigation rights and interests throughout the nation. Two states included in the great scheme are disputing the respective rights in the waters of the Arkansas River. Kansas claims for the supply of its own needs; Colorado replies that it has prior rights, inasmuch as it has the origin of the river within its own borders. Then the United States Government intervenes, stating that it has power to distribute through its Reclamation of Arid Land Service, and maintaining that neither Kansas nor Colorado has full rights. The case has taken two years to prepare; ten thousand pages of testimony having been written, at an expense of two hundred thousand dollars. Broadly, if each state near big streams be permitted to retain all water for its own enterprise, imigation of more remote states becomes somewhat problematical. If Government should secure control, great possibilities loom ahead, and the vast tracks of semi-arid America will put forth fruit and grain in abundance.

AN IRISH PARALLEL TO THE MASSACRE OF GLENCOE.

By A. STODART WALKER.

supplies no more tragic record than the massacre of Glencoe, when, under the cover of hospitality, the Campbell slaughtered the Macdonald.

The circumstances of this affair are amongst the most familiar in our historical annals; but an incident, very analogous in some of its details, which occurred in Ireland in the seventeenth century has not passed into public memory with such a degree of familiarity, and may serve the purcoses of a reminder by the present writer.

The central figures in this tragic episode were representatives of two powerful families in the torth of Ireland, now happily joined not only by xanctions of blood but by a mutual respect which us found expression in a long and unbroken extraged description.

change of deep friendly regard.

Of the families of O'Neill and Caulfeild, the wo leading representatives at the beginning of the erenteenth century were Sir Phelim O'Neill and Sir John Caulfeild, third Baron Charlemont. Sir Phelim O'Neill had, at the time with which we are encerned, been selected by the native insurrecconsts as a man eminently suited to lead them in he rebellion against the new English colonistsmacipally from Yorkshire and Norfolk—who had stablished themselves, not only by their remarkthe capacity as farmers but by their general barery and strength of character, in a position of turked ascendency in Ulster. With Sir Phelim Nell as the leader, the Rebellion of 1641 began. Talike many of his famous ancestors, who had stablished a record for bravery and stubborn reis acce to foreign aggression of which any family hight be proud, Sir Phelim was a man of feeble character and shifty principles, and a mere pawn a the hands of his fellow-conspirators, many of were as fearless as they were determined, ni as brave in arms as they were sure in the ranction of the righteousness of their national was to dethrone from their position is established forces of the implanted—and, as ber regarded, the usurping—colonists.

Almost the first act in the wild and fretful arer of this rebel chief was associated with a star whose uncle—the first Baron Charlemont, then caulful and been sent over by Queen Eigheth to subdue Sir Phelim's ancestor ('the great intor'), O'will, Earl of Tyrone. In the course of ize early expedition the deputy, Charles Mountjoy, foad it convenient to build near to the passage of

the Black Water, in County Tyrone, a fort which he called Charlemont after his own name, and left Captain Caulfeild to guard it. Afterwards Caulfeild was made Governor of Charlemont, and later was created Baron Caulfeild of Charlemont. At the time of the rising of 1641 a nephew of the distinguished soldier was the third Baron Charlemont, and, like his father and uncle, was Governor of the fort from which his title was taken; and it was against this man that the rebel O'Neill struck his first blow, in a manner that recalls the treachery of the Campbell at Glencoe.

On Friday the 22nd of October 1641 Sir Phelim O'Neill was received at the fort by Lord Charlemont with all the courtesy and camaraderie of a friend. From all accounts it may be gathered that the reception of the O'Neill was in accordance with the high tradition of the Caulfeild family, whose spirit of noblesse oblige and generous courtesy had made their name one to conjure with in the circles of chivalry and renown.

While Sir Phelim was being 'joyfully received and entertained,' to quote the contemporary records, his followers had gathered in great numbers in the vicinity, and at the height of the festivities, at a sign from the O'Neill, the rebels attacked the fort, massacred the whole of Lord Charlemont's retinue and men-at-arms, and put the Governor himself, his mother, sisters, brothers, and all the rest of the family under strict and stern surveillance and imprisonment; and it was only on the Governor's consenting to reveal the whereabouts of his many treasures that his life was spared for the nonce. Tradition has it that when the assembled guests were at the flood of their rejoicings the first sounds of the attack were heard, and that Sir Phelim then rose, and, suddenly throwing off the assumed air of friendship, addressed Lord Charlemont in words to this effect: 'For long the taunt has been thrown at my head from the fort of Charlemont that no Irishman could capture what an Englishman had built. Now I shall prove to all you cursed usurping robbers that the taunt is as idle as the spray of the water that breaks over Coney, as meaningless as the echoes of the whaup's cry as he flits over the water-soaked shores of Lough Neagh.'

For fifteen weeks the Governor and his family were kept prisoners at Charlemont. O'Neill then 'sent them about five miles distance to Killenane, the house of Laurence Netterville; and the next day sending away Major Patrick Davy, the Lord

Caulfeild earnestly desired Sir Phelim that the Major might stay with him, because he could speak the Irish language; but Sir Phelim answered that the Major was a traitor, and should not stay with his lordship, but that he would have better company before night!' That night he was sent to the Castle of Kinard, belonging to O'Neill, when, as he entered the castle between two of Sir Phelim's captains, one of them, Captain Neill M'Kenna, thus addressed Edmund O'Hugh, foster-brother to O'Neill, who was waiting to receive the prisoner, 'Where is your heart now?' Whereupon the other captain turned and fired a pistol at Charlemont. The shot missing its objective, O'Hugh seconded the abortive attempt by shooting Charlemont through the back, who, as he fell, cried out, 'Lord have mercy upon me!'

From the many traditional stories that have surrounded this treacherous murder, the following may be of interest to those who are fond of associating the occult with mere matters of coincidence. It is taken from an old Peerage of Ireland, published in 1754: 'The butler, an old and trusty servant, remarked that the assassin, his accomplices, and the noble family made up the odd number of thirteen, and observed with dread and concern that the murderers had often changed both their seats and their countenances, except the brave himself, who kept his place on the left hand of Lord Caulfeild, as he was wont to do, being an intimate acquaintance. The butler took an opportunity, whilst they were at dinner, to acquaint his lady with the cause of his uneasiness, telling her that he dreaded some direful event. She rebuked his fear, told him he was superstitious, and asked if the company were merry and had everything they wanted. He answered he had done his duty; they all seemed very merry, and wanted nothing he knew of but grace; and since her ladyship was of opinion that his fears were groundless, he was resolved, through a natural impulse he felt, to take care of his own person, and thereupon instantly left the house and made the best of his way to Dublin.' A more prosaic examination of this record, added to excellent evidence which was forthcoming at the subsequent trial of O'Neill, leads us to believe that a knowledge of the projected murder had already become known to some of Charlemont's servants and dependants, and that the said butler was merely making a picturesque addition to the dread fact that he already knew of the possibility of treachery. In support of this view of the matter it may be mentioned 'that Peter Pilly, his lordship's servant, three months before the Rebellion broke out, being threatened by the Lady Caulfeild that she would turn him away unless he would go to church,' he said she need not trouble herself, for he did not believe she would stay long at Charlemont herself; and the day the Rebellion began he went with Sir Phelim to Charlemont and took away his lordship's horses.

Following the murder of Lord Charlemont a reign of terror spread over the land, and within a few months forty thousand Protestant colonists were put to the sword or the flame by the order or under the personal direction of Sir Phelim O'Neill.

The sequel to this tragedy of O'Neill and Charlemont is found in the fact that, after the reduction of Ireland by Cromwell, the brother of the murdered man, William, fifth Baron of Charlemont, having received intelligence that Sir Phelim O'Neill was hiding on an island in the north, reached the island by boats, and seizing him there, conveyed him to Dublin, where, after full proof of his guilt had been laid before the Court of Justice, he was condemned and sentenced to an ignominious death; truly 'unwept, unhonoured, and unsung,' a veritable monster standing out in his unenviable notoriety as a black and bloody spot on the fair fame of a great and chivalrous stock. For there are few names in Irish history more praiseworthy and consistent than that of O'Neill. During all the troublous and treacherous times of the Danish and Norman invasions, when even the O'Connor sold his allegiance to the foreigner, the O'Neill held steadfast to his country's cause, and even 'the great traitor O'Neill,' named as such by Queen Elizabeth, earned that opprobrious title because of his fervent national patriotism. And there is something from the O'Neill point of view even to be said for the murder of Lord Charlemont, representing, as he did, the authority of 'the English garrison.' It was the manner of the deed that stamped it as a deed of treachery, and which, in addition to the massacres and atrocities which followed in its wake, made, in the words of Mr J. H. Cochrane, 'the name of Phelim O'Neill infamous to the minds of Ulstermen.'

Revenge and retribution being complete, there only remained for posterity to set a romantic seal on the closed wound which had driven the O'Neill and Caulfeild apart, for it is to be noted that amongst the ancestors of the present Lord O'Neill, one was married to Elizabeth Caulfeild, a daughter of the very Viscount Charlemont who had effected the capture and punishment of Sir Phelim O'Neill.

SAUCE FOR THE GANDER.

By G. G. CHATTERTON.

WAS but a gosling when my prescience was first roused to the fallacy of the proverb, of which I was yet ignorant, asserting that what is sauce for ganders is sauce as well for geese.

When five years old I and my twinbrother, and heretofore inseparable companion, had been sent on our first trip to the seaside; and, elate in the joy of untried experiences, we were making a simultaneous headlong dash across the shore to where a bevy of children were scooping a sea-filling trench round a castle of sand, when I was stopped short by our nurse.

'No, Miss Sophy, not you!' and she dexterously whisked me back, whilst I wriggled and protested. I must! I would! Fred had gone. Why shouldn't

Master Fred is different—he's a boy. I can't have you messing up your nice new frocks and things—likely as not tearing them to flitters as well. You come and sit by me, like a good little grl, and listen to what the pretty band is playing, and wait till brother comes back to us.'

But, unlike a good little girl, being of an evilly risellious mind, I declined to listen to the pretty band; and closing my ears alike against its music and the soothing conversation of my nurse, I rested in revolt, staring only at my brother's actions.

The water has reached to splashing Fred's trousers now! I cried presently, oblivious of my langity attitude; but, to my unamiable disappointment, nurse replied that wouldn't harm; he was waring only his serge ones, and went on with her swing.

Then why mayn't I wear only serge trousers?' demanded I out of my soul's bitterness.

For shame, Miss Sophy! You, a little girl, to sy such a thing, and after all the lovely frocks and sakes your dear mamma bought for you to bring lete! But we'll see by-and-by how glad you'll be when we make friends with other little girls who laven't half such pretty things, and they invite learn the same of the same transfer of the same trans

But the profered consolation, when it came to be ableved, failed fully to salve my stubborn spirit, and to the end of our sojourn by the sea the sight of my twin-brother waist-deep in oozy sand and simy weed, whilst I played in dull, dry cleanliness with integrils taking care of frocks less embroidered and with narrower ribbons for their sashes than these it formed my nurse's pride to deck me in, it was the profession of the sashes than the my nurse's pride to deck me in, it was the profession of the sashes than the my nurse's pride to deck me in, it was the profession of the profe

it was an epoch in my sex, lingering in my memory, whilst proceeding in life I came to marvel bow an apothegm of the mendacity that alleges that identical seasoning serves for gander and for some could ever have attained quotation.

Yet, void of desire of posing as another Aristides, I launch no comparisons between the seasoning allotted for the ethical garnishing for the symbolic poultry. I cheerfully pass over divagations of my twin through which he continued shining with untarnished lustre, whilst had I ventured on their bare outskirts my reputation, like the restraining smart frocks of my youth, would have been 'messed up, and likely as not torn to flitters as well.' Only, out of the continuous sacrifices since that one of childhood's unfading impressions, I like to point to the unequal liberty between the sexes in the hampering of the body imposed by the array of women. Slight factors form great effects. The quacking of some ducks made all the difference to an imperial city, the nibbling of a little mouse materially affected the most powerful of beasts, 'sands make a mountain,' and it has appeared to me that diversities in modes have preyed upon the comradeship of my brother and myself for all our years. His ever have seemed fashioned for utility and comfort, as mine for hindrance and lack of ease. And I must accept my penalties, because, whilst secretly still longing that my wear might be 'only serge t-,' I am of a moderately modest, partially self-effacing disposition, and regard them as the lesser evil than the ensuing notoriety should I take my walks abroad luxuriously bloomer-clad, with close-cut hair.

From gosling up how I have coveted my twin's cropped locks! Mine, encouraged in redundancy, flowed long and heavy on my shoulders, and, rompruffled, entailed prolonged and often painful combing before I became eligible for the drawing-room, where Fred, spruce and shining after brief administration of the brush upon a head where every hair had stood awry and on end, had long been enjoying the limited period there for the more select toys and stories read aloud. This was my noviciate for travels of our maturity, when, succeeding the night made restless and uneasy by hair adjustments forbidding the angle of comfort to my head, dawned the morn of misbecoming dishevelment, whilst a few turns of his brush restored elegance to my brother, who the night long had nestled luxuriously into what corner most appealed to him.

Then the hats upon these heads of ours! And yet have I heard man, the pampered, rebel against his tall one as heavy and, forsooth, pressing on the brow! How would his plaint be voiced had he to balance and affix it by impaling with long pins, which, unless stabbed in with care and time expended, can preliminarily dig scratches in the scalp, or, wearing against the grain of tight-tied hair, can blight the day with smarting ache? Putting on my hat I must go delicately, though Fred increases in masculine fuss downstairs. 'Hurry up!' he cries

as he takes his from the peg and pops it on without consideration or delay. 'What ages you women always take to get outside a house! I say, it's beastly muddy,' he discovers on opening the door, and stooping, turns rapidly up his trouser-hems, 'and perhaps we'd better take our brolls—just wait a sec. and I'll fetch them from the hall.'

I utilise the 'sec.' in painstakingly gathering up the many folds that form my skirt, feeling my way carefully lest with it I indecorously gather up as well my petticoat beneath it; and Fred, returning, thrusts my umbrella into my least full hand. 'A broll's a bore,' he comments cheerfully, running down the steps in his neatly turned-up trousering.

'A bore!' I cry. 'For you, with a whole arm and hand lying idle at your side! May I ask how you'd describe one were you me, who, year in, year out, whether for umbrella, muff, or parasol, need quite three hands to help me? Just imagine that every time that you set forth you must draw up a trouser-leg in each hand, carefully, so that one may not be raised waist-high whilst the other dips in the gutter at your heel, and then, lest either still may slide to that effect, you must hold them in clutch all through your walk, with fingers growing cramped that must as well grip your brolly'——

'Great Scot,' burst out my brother, having striven to grasp the plight, 'what an inf—an outrageous infliction! I never had thought it out before. Yet, after all, I can't well carry both our brolls along down Piccadilly, can I?'

'No, dear boy, of course you can't,' agreed I, touched by the sympathy in his tone; but whilst on the topic I pressed home to him many other little blessings vouchsafed him over me, which he accepted with the unthankful taking-for-granted begotten of his superior position as a man. I had flamed out over what I held the heaviest of my sex-shackles in carrying about long skirts, and now I dilated gently upon hat-pins and scalp-scratchers to shame him against murmuring over mere weight and pressure of his tall hat; upon brushing out and tying up long hair, and holding it in place with pins and combs, so that he might refrain from chafing about the paltry vexations of shaving, and the falling short from perfection in razors; upon my paucity, if not entire absence, of pockets, so that on an already laden arm I must sling a reticule for the bare needs of my day.

'Your pockets are among your manly boons I greatly envy, whether I see you jingling your loose coin in some deep recess, or producing your delightfully commodious pocket-book for letters and papers; and then you have as well your cigarette and card case; and all so effortlessly laid hands on without even changing your position. And room and to spare behind them, too. Why, the other day I noticed your pocket swallow whole your Royal Academy catalogue! To me it's all as a conjurer's trick. You have pockets of every size and shape, and all at nice reachable points—chest, ribs, hips—

without looking bulgier; whilst, just think, this one small bag must be my all.'

'That one small bag!' Fred echoed stupidly. 'How do you manage?'

'Manage without,' I told him promptly. 'I am a woman.'

'Of course I've always known that women stand out of lots of things,' Fred pursued. 'Of big things—well, I mean of seeing things, and doing them, and going to them; and don't want them, I suppose—used to it, and don't think about having them, or don't care, I always fancy; but, hang it all! all these small handicaps that I had never noticed rounding on one at every turn must be the very—must be beastly drawbacks. You've made me imagine them tacked on to myself, Sophy! I never before thought about'—

'About the different sauce served to gander and to goose in even the small details of their lives.' But never mind, dear; don't deeply grieve for me. We geese contrive all the same greatly to enjoy ourselves.' And we lightly laughed as we turned up gay Bond Street; and, after tea there, Fred, a woman-hustler as are all unthinking men, waited with sweet patience whilst I collected and arranged my little bag and my umbrella, and gathered together the voluminous material of my skirt for its skilled uplifting from the mud.

AN OLD SPINET.

I LOVE it. Why, you fail to understand; Your brow you wrinkle; So thin against a strident modern 'grand' Its tiny tinkle.

I grant you that. But then my old spinet
(Date, seventeen-twenty)
Has, since the past for me is living yet,
Beauties a-plenty.

I love to think of twilights long ago:
Wax tapers glimmer,
And, round my spinet, maids with eyes aglow
And gowns a-shimmer.

The songs they sang! Lilt, catch, and madrigal,
Gracious and flowing;

Such as the faded song-books give us -one and all Worthy the knowing.

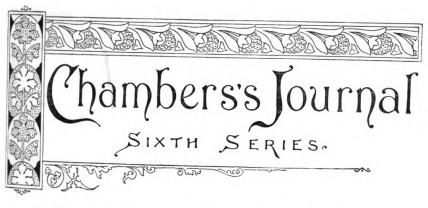

I dream that Prudence touched the small white keys
With hands still whiter,
Whilst Dorothy or Susan sang to please

Whilst Dorothy or Susan sang to please Some valiant fighter.

Or it may be that Lydia, sad at heart,
Loving and slighted,
Played out her sorrow wistful and apart,
And dreamed it righted.

Fantasies all! Yet I have found them fair,
These dreamings golden;
And for their sakes I prize with tender care
My spinet olden.

F. W. SAUNDERSON.

HEROISM ON THE FOOTPLATE.

By G. A. SEKON, Editor of The Railway Magazine.

HE trite saying, 'He carries his life in his hands,' can with absolute truth be applied to the railway enginedriver. His avocation is fraught with continual opportunities not only to bring his own career to a

tragically abrupt conclusion, but to cut short the life of hundreds of people who hourly trust themselves, without a shade of fear regarding the consequences, to the care of our engine-drivers. So well is he trained and disciplined that, however sudden the occurrence or however alarming the direct state of the emergency, the locomotive engine-driver rises to the occasion, and in most case the danger is overcome, death is averted.

Although the contributory causes of accidentssuch as defective permanent way, locomotives, and rolling stock, insufficient signals, inadequate brakelower, and laxity of rules—are now almost things of the past, it must not be forgotten that the improved methods now obtaining in the operation of our nalways have introduced other perils. The monster agines, the heavy trains, and the high speeds now formally made by expresses all tend to bring into play another series of dangers. The danger resulting from a collision or derailment in which an oldime train—weighing one hundred tons, hauled by in engine of fifty tons weight, travelling at forty ailes an hour-was concerned is not likely to be s serious as a similar catastrophe befalling a nodern express, weighing three hundred tons, have ling at seventy miles an hour, and hauled by a locomotive weighing a hundred tons.

Such considerations, however, do not trouble the regine-driver; he accepts the improvements in his machine, in the permanent way, and in the signalling of benefits to his calling. He probably considers them as only lightening the responsibility at one place to increase it at another.

It must be admitted that, broadly speaking, the diver's conclusions are correct; the personal element No. 480 — Vol. X.

the improved methods and apparatus do not count; at such times it is the human element that is everything. Naturally, the modern modes and practices have much limited the field in which untoward events can happen, whilst the stricter rules now governing railway service also considerably restrict the opportunities for doing things that present possibilities of danger.

From the foregoing, readers will gather that whilst the drivers of our trains to-day are as capable as those of yore of acting when emergencies arise, and as willing to perform their duties in the face of difficulties-yea, if necessary, to face death itselfthe occasions when these sterling characteristics are called into play are not now so frequent as was the case some years ago. Yet the risk of danger to limb and even life is ever with them. A tube may rupture; something may cause the flames to rush out of the fire-box door and envelop the footplate ; a steam-gauge glass may burst, with the result that clouds of steam and torrents of boiling waterworse than fire-will force the men from their posts; and to save their lives they must escape to the back of the tender or to the front of the locomotive. At the first outburst of fire or steam we can well imagine that the men will step back from the front of the footplate. The giant engine is then without a guiding hand, rushing onward probably against signals and around sharp curves to destruction. The thought of the duty he owes to the human beings committed to his charge will at once occur to our heroic driver, and at the risk of his life he makes his way through the fierce flames or scalding steam, grasps the regulator and brakehandle, and so stops the train, emerging from the ordeal perchance sightless or with injuries necessitating the amputation of a limb. There is the chance of the regulator jambing, a chance that is increased in these days by high-pressure steam and mammoth engines. In such a case the men on the footplate must rely upon the valve-gear and the brake to control their runaway steed and bring the train to rest.

cies occur, Let us picture to ourselves the last awful tragedy
[All Rights Reserved.] FEBRUARY 9, 1907.

that may at any instant face the men on the footplate of a locomotive travelling at the highest speed. Suddenly they see before them, perhaps but one hundred yards ahead, an obstruction that must wreck the train and deal out death and injury to its living freight. Only these two men out of the hundreds on board know of the approaching disaster; the Fates are more merciful to those in the carriages, for the catastrophe happens to them instantaneously, without the agonising waiting for the crash which is endured by the driver and fireman as each moment brings them nearer to the place of impact. What swift decisions have to be made and acted upon in those few face-to-death moments: whether to shut off steam and apply the brakes, or still to rush forward at the highest speed in the hope of cutting through the obstruction; whether to jump from the engine to save themselves from death in one form, with the certainty, if not of meeting death, of being maimed for life as a result of the leap! Then, after the collision, if these men are not killed outright they will probably be pinned against the fire-box and roasted to death; or, if they escape this terrible fate, it may be that an equally horrible deaththat of scalding-awaits them.

Is there one among us who does not feel that these men are possessed of sterling courage? Any day, at any moment, they may have to face the ordeals depicted above, yet they are apparently unconcerned; for 'men must work; . . . there's little to earn and many to keep.' Doubtless they do not think of what may happen; if they did there would probably be a lack of engine-drivers and firemen.

We shall never know the causes of the terrible disasters at Salisbury and Grantham; but if the drivers were at fault, they paid for their mistakes

by their lives.

How frequently engine-drivers avert direful calamities the public never know. The mere fact that the accidents are averted itself prevents the circumstance of their tragic imminence from becoming publicly known; hence the actual cases that can be referred to are comparatively rare. But cases such as those that we shall refer to have happened, and do happen, whilst similar ones will doubtless occur again.

Two trains travelling in the same direction are approaching each other on converging lines. One or the other driver will see that a collision is inevitable unless co-operative measures are taken before the other-usually the one in fault-will apprehend the danger. How shall the wide-awake driver act to avoid the collision or at least minimise its effect? He must both decide and act instantaneously; a delay of a fraction of a second means increasing the extent of the approaching disaster. Swift as thought, he at once opens his whistle, hoping thus to awake the other driver to the danger of his position. At the same moment his quick eye has taken in and gauged the speeds and weights of the two trains, and has enabled his alert mind to weigh the chances and decide whether his better plan is to

put on speed, in an endeavour to reach and pass the converging point before the other train, or, on the other hand, whether the accident can be prevented or its effect lessened by shutting off steam and applying the brake and using every effort to stop his train. Readers will see that decisions on questions of this character depend on quite a variety of circumstances, if a successful issue is to result. The distances to be covered respectively by the two trains before the fouling-point is reached, and the amount of brakepower at the command of each driver, must be taken into consideration. The sound of the dangerwhistle will probably call the attention of the lethargic driver to the position of the trains, and the chances are that such a man will endeavour to stop his train; so that, other circumstances being propitious, the alert driver will probably make every effort to pass the converging point before the other train reaches it. Think of the mind-tension the men on the footplate must endure whilst the result remains in the balance, each second seeming like a lifetime to them. Perhaps the chances have been too many, with the consequence that disaster -not the boldly-striven-for success-has attended the drivers efforts. It may be that both drivers endeavour to stop; and then the agony is long drawn out as, at ever-decreasing speed, the trains approach the fatal point. Although the duration of the mental anguish is thus prolonged, it gives the enginemen an opportunity to jump off ere the collision occurs, should such be inevitable.

The interlocking of signals, &c., theoretically makes collision impossible if the signals are acted upon by the drivers; but theory and practice do not always agree. At Crewe the signals were at the same time off for a North Staffordshire Railway train and also for one for Shrewsbury. These two trains would have met at right angles and a disastrous collision resulted, as both drivers, having by the signals a clear run, would not expect to meet an opposing train. A driver of a train in a siding saw both sets of signals 'off;' his knowledge of the line instantly told him what the result would be, so he jumped from his engine and hastened to the signalbox, arriving there in time to have one train stopped and the collision thereby averted. An examination of the signalling apparatus showed that some snow had got into the detector lock of the interlocking frame, and so prevented the lever lock from falling into the slots, thus making it possible for the two trains to be signalled at the same time. This example of the alertness of mind and quick appreciation of what would have resulted from the incident was not lost upon the directors of the London and North-Western Railway, who not only rewarded the driver, but had a notice commending his conduct posted up in the various engine-sheds, so that other drivers would know that the directors appreciated his action.

On a single-line section of a Scotch railway the quick-wittedness and pluck of a driver prevented a frightful catastrophe. A goods train was put into a siding to allow an express passenger train to over-

take it. The operations were carried out in a great burry to avoid the passenger train being delayed, and the 'line clear' signal was given before the whole of the train was in the siding. When the express was approaching, it was discovered that the goods train was longer than the siding could accommodate, so that the engine occupied the main line to the extent of several feet. It was too late to stop the approaching express, and a disaster seemed imminent, when a plan of action occurred to the active brain of the driver of the goods train, which he immediately put into operation by opening his regulator and putting the power of the engine against his train. This action caused the spring-buffers to compress, so that the train occupied several yards less space. li was now a fight between the power of the engine and the pent-up force of the one hundred buffer springs. If once the engine-wheels commenced to sip the springs would probably gain the mastery and force the engine on to the main line in the face of the on-coming express. The driver gallantly stock to his post, manipulating his engine until the increasing roar caused by the approaching train told him the express was close upon him; then, leaving the regulator and the sand-valves wide open, he aped from his engine. Fortunately his action was successful. A few inches only intervened between the two trains, but the express swept by in safety.

Sensitional stories are not infrequently current applically describing chases after runaway locobatives. Such events do occasionally happen, for a time an engine does get away, sometimes because it is not properly placed out of gear when the men kit it, and the steam pressure has since increased afficiently to work the engine. Another cause for machine away is the handling of the footplate-gear in machine or inexperienced persons.

The easiest way to stop a runaway is to derail at some facing points; but this method is not l'ars practicable, nor is it always advisable unless the engine is running away on the wrong linethat is, in the up-direction on the down-line, or na row or is likely soon to collide with a train meding in the same direction. In other cases, rouled an engine in steam is available, efforts be made to overtake the truant locomotive; to do this requires a long, clear run, an exenneed and quick-to-act driver at the regulator, riadaring and cool-headed man to stand on the the pursuing engine, ready to spring to the mnaway when the following engine catches the quarry. The dangers of the performance th increased when the operation of coupling the to make together at the time of impact is carried To the daring man who will board the unremit locomotive it is even more risky if the Cant be performed on a parallel line; but as this tethod is safer when the rescuing engine can travel a the right line (the risks of collision with the rant being avoided), it is adopted when the rancies of the traffic permit it. To successfully hanpulate the speed so that a man can safely pass from the footplate of one engine to that of the other requires nice discrimination on the part of the driver.

The continual looking ahead for signals is a strain on the driver; and numerous systems-some simple, but mostly complicated—have been invented by means of which the position of the semaphores along the line, which control the passage of the train, are repeated within the cab of the engine. Some of these systems are already undergoing exhaustive trials, the Great Western Railway giving a good deal of attention to the matter, as it is felt that the substitution of audible signals for visible ones will relieve drivers of the considerable mental strain that results from the continual looking out. for the signals, especially in foggy or snowy weather, when the semaphores are likely to be obscured. It is only during recent years that this view of the subject has prevailed, for the late William Dean, when locomotive superintendent of the Great Western Railway, would have nothing to do with signals fixed in the cabs, but insisted upon the engineman looking outside for the usual semaphores. There was a good deal of sound sense in Mr Dean's view of the case, which was that the signals were not the only thing the engine-driver had to look out for, and that if the signal were repeated in the cab of the engine the men would fail to look ahead at all, and would therefore not see obstructions, &c., on the line, and thus the consequences of not looking out might result in serious accidents.

The semaphores cannot always be relied upon correctly to convey the signal intended. The disastrous Abbots Ripton accident on the Great Northern Railway, and possibly the Arbroath disaster of Christmas 1906, resulted from a signal-arm showing 'off' when, had it correctly reproduced the signalman's movement, it should have stood at 'danger' and stopped the ill-fated Scotch express. An examination of the apparatus showed that the frozen snow had prevented the signal-arm rising to 'danger' when the signalman operated it, so that it consequently showed 'all right' to the express, and the fatal collision resulted. prevent another disaster resulting from this cause, the Great Northern Railway discarded the form of semaphore pivoted at the end, and introduced the balanced type, well known to travellers on that system, which works on a central pivot, and is called the 'somersault signal,' the arm of which has no direct connection with the perpendicular

In addition to the worries that are inseparable from service on the footplate, the engine-driver at times is put to some trouble in answering reports, the framing of an explanation that will be satisfactory to his superior needing much mental effort with some drivers. Occasionally the zeal of minor officers of the locomotive department gives drivers an uncomfortable number of these reports to answer. Meddling people with plenty of time on their hands get to know this, and seem to delight in reporting to such officers what these busybodies consider

are breaches of regulations. The drivers, however, occasionally score, as in the case narrated below, when a certain aged plutocrat residing in the most aristocratic suburb of Liverpool reported the driver of a certain train for 'emitting large volumes of white smoke, and allowing the engine to make a terrible scrumming noise.' The locomotive officer, with more zeal than discrimination, immediately called upon the offending driver for an explanation. He explained that the 'white smoke' was the exhaust steam; and that, with regard to the 'scrumming noise,' he could not find the word 'scrumming' in any dictionary, and so could not explain the circumstance. The locomotive officer thought it best not to pursue the subject further.

If our readers can get the entrée to one of the large 'barracks' provided by some of our railways for the accommodation of enginemen and others whose tour of duty has ended far from home, they will hear narrated numerous narrow escapes that the men have experienced, and they will also have an opportunity of enjoying the wit and humour of the drivers, many interesting mots and much good-tempered chaff being in evidence in the room where the men take their meals. Here are a few specimens of the stories to be picked up:

A certain driver, although frequently called upon to explain breaches of rules, was never fined. This was a circumstance which his mates could not un-

derstand, so they asked the man how he managed to escape. His reply was: 'The only explanation I can give is that I always myself write my explanations very fully.' This explained his immunity from fines. His handwriting was so atrocious that the busy officials could not spare the time to decipher what he had written, and, seeing that he had filled several sides of paper with his explanation, let the matter pass.

2

On one occasion, at night, the enginemen were relieved at a siding some distance from the 'barracks,' and had to cross a number of point-rods and signal-wires to reach the latter. The driver boasted that he knew the position of all these obstructions in the dark. Suddenly he stumbled over one and measured his length on the ground. As he picked himself up he called out to his fireman, who was following, 'Here's one, mate;' and immediately his worthy fireman, who had seen the fall, replied, 'I can find the beggars that way myself, mate.'

Drivers as a class are particularly steady, and rarely take intoxicants when on duty. There are exceptions, and if the propensity gets known among a man's fellow-drivers, the jovial one (as we will call him) has a good deal of chaff to put up with. Of one driver, who was notorious for making bad stops, his mates used to say 'he could always pull up opposite a refreshment-room, but never at a water-column.'

THE LORD OF THE MANOR.

CHAPTER XII.

R CASTLERAYNE was having an exceedingly bad quarter of an hour at the hands of his younger daughter. She was full of questions; she bubbled with pointed interrogation. Was her father going to sit down and see

this disgraceful thing accomplished? Was he aware of the fact that, practically speaking, he owed Aunt Gertrude five thousand pounds? Did he know that he had robbed his sister of her fortune bit her hit?

To May's intense surprise, she had found Aunt Gertrude quite fixed on her intention. She had been gentle and smiling, blushing and tearful, by turn; but she was perfectly firm. May had hoped for better things on a night's reflection, but morning brought no change. Aunt Gertrude had been up betimes; she had been as far as the hospital, and Craggs had arranged for a local man-of-allwork to call later in the day for Miss Castlerayne's lares and penates. It is just possible that Rayne Castlerayne regretted his behaviour of the previous evening. But the head of the family had given his word; he could not go back now.

'We were ever a headstrong race,'he said grandly—'headstrong and impulsive.'

'I should scarcely call Aunt Gertrude headstrong,'

May said dryly. 'You have only to go to her and offer her an ample apology for'—

"Apology? My dear May, the magnanimity of my conduct—— But, really, it might be a great deal worse. It is not as bad as a girl of position marrying beneath her station. If Gertrude chooses to quarrel with me, why'—

May abandoned the contest as hopeless. She was a little sorry for her father, too. He had a worried expression, and a heap of papers before him. He was making some sort of effort to grapple with his position. And perhaps Aunt Gertrude had not so very much to regret. It might only be a matter of hours now before the old home was in the possession of strangers. When the crash came the episode of Aunt Gertrude and the hospital would only be a minor one in the clang of the great catastrophe.

'I am not in the least an object of pity,' Aunt Gertrude said cheerfully. 'I shall be very comfortable in my rooms yonder. The sitting-room is charming; the view is far better than the one from here. I have all the furniture I need, and flowers for the getting. All I require is a certain amount of time, with some table cutlery and glass and silver. And there are three bedrooms, in case you and Angela need one each.'

'I am afraid that people will talk,' May ventured to suggest.

But Aunt Gertrude cared nothing for that. People were certain to talk in any case. Her cheerfulness was a pretty thing, but obviously craggerated. For over fifty years The Towers had been her home, for the most part a sad and miserable house; but then it is one of the rare blessings of Time that he softens all the pain and brings out all the pleasures when one looks back from the autumn of life.

It was nearly four o'clock before the exodus was made, and the homely, tender figure crossed the Common in the direction of the hospital. The head of the household had gone over to Hardborough to consult his solicitor. He was more disturbed and dismayed over the business than he would have cared to confess. He had said on the spur of the moment that which had struck him as quite the proper thing to say; he had not expected for a moment that his sister would take him at his word. He had anticipated tears and a plea for ingiveness; he had even prepared to be exceedingly magnanimous. It had never occurred to him how deeply the knife had cut, how cruelly his speech had wounded. And May's plain words had rankled in his beart as he drove along. He had not slept either, and his usually robust appetite had left him. He wondend, too, what brought about these fits of giddiness, and why his lips twitched in that singular manner.

His head cleared again, and his nerve came back to him. Of course, all that talk about Gertrude and the hospital was all so much feminine hysteria; (Gertrude would be seated at the bottom of the diamer table as usual. These things would wear off. The head of the household would not have been quite so easy in his mind if he had seen the late caravansera crossing the Common at that ane moment.

It vas not Craggs who came to meet the processon and give his aid in getting that little pile of bosehold gods into the cottage. On the contrary, a all figure in gray Harris tweed stood on the threshold. May's heart gave a little leap of delight as she recognised the figure in the September sunshine.

'Ar Warrener!' she cried. 'I was wondering that had become of him. I began to think that he Clifford Warrener!

Clifford Warrener advanced smilingly. He was single pleased to see the flush that mantled to the head of the case as he shook hands.

I have been exceedingly busy lately,' he said. I have been exceedingly busy lately,' he said. I slept in Hardborough last night, and came home being to see Craggs. The hero of the fight had to go to Hardborough himself this afternoon, so I did at gather much news, except the startling information that Miss Castlerayne was taking up her abode here for the present. Don't think that I mean to be inquisitive if I make a guess at the reason.'

The reason is quite simple,' Aunt Gertrude said.

'No brother found out all about Craggs and that hare. Naturally, he was exceedingly angry. I

dare say I should have taken exactly the same view if I had been in his place.'

Warrener discreetly turned the conversation; it would have been bad taste to pursue it further. But he could not altogether keep the contempt from his face. He professed his readiness to help with the pile of luggage standing on the smooth turf in front of the hospital.

'I am looking for some outlet for my energies,' he declared. 'Let me act as porter for you. There is something in the air of the place that is a certain cure for idleness. I have brought my golf-clubs with me for a few practice-shots, and I am accompanied by a mighty player who is also a great authority on the game. He can do for a new golf-links what Clement Scott did for Cromer; to go higher up the scale, what Wordsworth and Coleridge did for the Lake District.'

Warrener's eyes twinkled strangely as he spoke, and May laughed as if she understood and saw something subtle in the plain statement of facts.

'What is the name of your friend?' she asked.
'I fancied I saw somebody with a bag of clubs on the far side of the Pulpit Rocks.'

'That was Raymond Brooke right enough,' Warrener replied. 'I left him in a state of fascination by the Pulpit. We are staying at Watson's farm for a few days. But let me help in getting this stuff into the cottage.'

It was all done at length, to Aunt Gertrude's satisfaction. Nothing seemed to have been forgotten. They all sat down to tea, served on an oak gate-legged table of Cromwell's time. Any connoisseur would have raved over the chairs and the settle and the dresser. With tears in her voice and moist eyes, Aunt Gertrude declared that she was delighted with her new abode. They walked out presently across the Common to find the indefatigable Brooke. He came up presently with a look of interest, dragging his bag of clubs behind him.

'Never saw anything like it,' he said. 'And I'm not easily pleased, as you know. How it came about that a spot like this, made for the game, has never been'—

'Try and restrain yourself,' Warrener laughed. 'Manfully refrain from using a language that the ladies do not understand.—Let me introduce my friend Brooke to you.'

They paired off presently, Warrener a little in front with Angela. The heather was crisp to their feet; the glorious breeze from the sea was in their faces. The sun, slanting across the Common, filled it with a golden glow. The distant hills were veiled in a blue haze.

'Mr Warrener, I want to ask you a question,' Angela said suddenly. 'May says that you have come here with some plan; in short, that there is a possibility of averting the ruin that hangs over our house. Our troubles are not strange to you; therefore I can speak all the more freely. I have not forgotten that morning in the rose-garden three months ago. Is it possible that there is any way of saving us?'

'I think I can promise that,' Warrener said slowly and thoughtfully. In fact, I am down here for that very purpose. With a less elaborate and stiff-necked man than your father I could have spoken freely at first of my scheme. He would not have listened to it. He did not sufficiently realise his position. That is why it was necessary to permit things to take their natural course. Had it not been for your aunt I should never have succeeded at all. You don't recognise what a heroine she is: Jeanne d'Arc was no greater. No wonder my father loved that woman.'

'It seems sad,' Angela murmured. 'I-I have learnt a great many things lately. It is very foolish of us to despise other people because they are not Castleraynes. It is a dreadful thing to be living on other people as if you were conferring a favour upon them. And now, what is going to become of us?

'Oh, you will find that there is no occasion to worry,' Warrener said. 'My scheme is going to save all that, and Aunt Gertrude is the heroine of the story. I am going to try to see your father some time to-morrow. I fancy that the time has come when he may be persuaded to listen to me.'

'It has something to do with the Common?' Angela asked eagerly. 'You could do nothing so long as the Common was apparently in the

hands of the lord of the manor?'

'You have guessed it so far,' Warrener said 'It has everything to do with the Common. And it has nothing whatever to do with a hotel. You may imagine that the Common has passed from under your father's sway, and

The next best thing to the rose that is true. is being near the rose, and the next best thing to the Common is all that glorious bit with the lovely views about it. But I see that you are as much in the dark as ever, and I prefer to keep you in suspense for a little longer. It is pleasant to see you smiling in that way; it is a sign that you have forgiven me.'

e :

Angela's face was flushed; there was a tender light in her eyes; her mouth was soft and drooping. Warrener had never seen her look like that before; but in his mind he had always pictured her with an expression like that. He could see that the ice was melting from her heart, that the pride of race was passing away.

'Let me ask you a question,' he said. 'It is a fine thing to be a Castlerayne of The Towers; but has it been a happy life that you have passed there?

'No,' Angela said boldly and candidly, 'it hasn't Mr Warrener, I am ashamed of myself. I should like to have my time over again. There are happier lives'-

Indeed there are, Angela. Mine, for instance. And some of these days, if I could only persuade you to share it with me, why'-

Angela's face flushed again, but her lips quivered

in a smile.

'You have not given me your confidence, so I shall refuse you mine, she said, though there was no sting in her voice. 'I am going back to pet Aunt Gertrude. I feel as if I could not make enough of her to-day.'

(To be continued.)

AYRES. BUENOS

By A RESIDENT.

I must be extremely difficult for the English mind to realise the life of their countrymen resident in the Argentine Republic. It is calculated that there may be forty thousand British subjects here; certainly

it is a very important community, and is also the foreign element of the most consequence, chiefly perhaps because it is British enterprise which controls the railways and financial institutions in a way probably unknown in any civilised country. Indeed, it may fairly be boasted that had Englishmen never entered the republic its wealth and political influence would still be insignificant. The railways have been, are, and will be the principal means for developing Argentina, and they may be said to be wholly due to British capital. That being the case, anything which may enlarge the knowledge in England of this wonderful country must be of importance to the readers of English newspapers, so many of whom to-day have a pecuniary interest in its progress.

It is but natural that any one who gives informa-

tion about Argentina should launch forth into extravagant praise of its resources and of the money made there; but such just tribute is also apt to be misleading. It is at once presumed that with its feverish activity and extraordinary resources such a land must be the El Dorado of the younger son and of those who find life in the Old Country irksome or little lucrative. It is this same tendency that should be carefully guarded against. Indeed, at the outset it should clearly be set forth and insisted on that, however good a country Argentina undoubtedly is for the few to make money in, it is not one to be patronised by the man of little capital and no experience in its ways and customs. No one should dream of landing in Buenos Ayres unless he have an assured income of one hundred and fifty pounds a year, either derived from capital or from work which he is certain will be permanent. Young fellows arrive here every day almost in shoals, both from England and the Cape, to find they are a drug in the labour market, and are told that they are not wanted, and had better-far better-try their fortune in a British colony. Such plain speaking, if not in every case good for them, is certainly good for their friends at home, as it may save many a man from being dumped down here at a later day. This is a warning much needed, and the British Consul, ministers of religion, and leading merchants will certainly testify to its accuracy.

The writer's mind has now been unburdened of its disagreeable load of duty; let it be added that, a firm footing once obtained here, it will be the man's own fault if he do not make a good living, and one sufficient within a few years to justify his marriage and settlement in Argentina—though with such drawbacks in prospect as regards sons and daughters as should make a man count the cost of his primitive audacity. To speak more plainly, the moral atmosphere of Argentina is tainted. Good education is very difficult, if not impossible, to secure, especially for boys, who must also prepare themselves for conscription at the age of nineteen. Of the separation of husbands from wives and both from their children it is needless to speak; but certainly the misery caused by such separations should not be left out of the count when elders are advising the younger generation to emigrate to make their living in distant lands. It is very real, and possibly too addom allotted its full value when the subject of 'where to send our boys' is being discussed. A British colony, though it may not be shrouded in the same glamour as Argentina, would, it may be shrewdly suspected, afford a larger prospect of happiness in the far-off future—a future which to the old looks so short in retrospect. The truth is always the best; and though one may be dubbed a pessimist, it is really kinder when the question arises to speak frankly and not to hide the ills which must be incurred in settling even in such a splendid country as Argentina, for in rery many ways life has considerable charms here for young folk whether in town or country ('camp,' a it is called here invariably, simply because the Spanish word campo means country). Working in the 'camp' means working in the 'bush,' and is the local term to be heard on all sides, and one even recognised as quite classical by the Englishwritten press of Buenos Ayres.

To the ordinary globe-trotter—a disagreeable but expressive word—the beautiful, rather handsome city of Buenos Ayres must come as a grateful surpise. The luxury and wealth which throng the streta, avenues, and parks are almost incredible. For hours during the day it is difficult to thread one's way along such thoroughfares as Florida, Eartoloné, Mitre, San Martin, Reconquista, and Cangallo; and even the magnificent Avenida de lago requires all its wide pavements and roaday to afford comfortable passage to the crowds of men, women, carriages, and cabs which unceasingly throng it till late at night. The perplexing a priads of North American and European made

electric-cars which whirl in almost interminable succession along the streets in the centre and for miles out are alone a revelation. At night the scene is almost as remarkable, thanks to the aid of unstinted electric light lavishly displayed by the municipal authorities and private individuals catering for custom. In the whole of London there is not one street which at night can vie with the Avenida de Mago, and the sight must be seen to be appreciated. Let the reader picture to himself the moonlit river, boundless on the horizon as the sea, above which rise terraces and public gardens (after the interval of magnificent docks and warehouses), crowned by the palatial Government House, covering four acres; then let him look across the Plaza de Mago-bordered with umbrageous plane-trees and enclosing gardens dotted with gigantic tree-ferns-down the Avenida, right away for over a mile to the new Congress Hall, Capitol in form, in width thirty-three yards from wall to wall, paved with asphalt, and illuminated by a lofty line of arc lamps and lined with spreading trees. Having taken his fill of the brilliant prospect, let him saunter down, keeping on the right the lofty municipal offices at the corner, and pass the Prensa building (the most palatial and gorgeous habitat of a newspaper, without exception, in the entire world, with a gilt figure of abnormal size representing the Press, and bearing in its apparent flight an electric lamp fit for any lighthouse, at a height of about two hundred and seventy-five feet above the pavement), past the Progress Club and its luxurious windows of vast proportions, past offices and shops all vaunting wealth and luxury, on beside the small tables and chairs innumerable (each with its occupant drinking cooling beverages or coffee, but very little spirits comparatively, as drunkenness is not an Argentine vice), till he reach the zone of hotels half a mile down the avenue, and then he will begin to realise that it is not for nothing that the luxury and wealth of the Argentine Republic has been written about and wondered at.

Let it be said at once that Buenos Ayres in an extraordinary way is the heart and soul of the republic, where all its wealth is spent-if not squandered-the very soul of the country for everything good or bad politically and socially. To the young Englishman, in contrast with the tourist, the 'camp' affords wonders and pleasures of a different sort, though no less engaging at first; but it must be confessed that the monotony of camp-life becomes in time somewhat trying, unless a man takes a keen pleasure in animal life, if it be only represented by the horse, cow, and Of the political and social life of the country there is no space now to speak; but each has its value to the Britisher whose lot has fallen here; and on another occasion we may try to give some idea of the general life he leads on Argentine shores.

MYSTERY. MILANESE

CHAPTER II.

OUR other days passed, and Douglas was distressed to realise that he still knew no more about the secret history of the exploded five than the average man in Milan's streets. Other investigators were at work

with more success. On his third evening in the house of Bassano the cobbler he read an engrossing column on the subject in the Gazzetta of the day. Andrea Guisano's executors had found among his papers an unsigned letter conveying a distinct warning that something would happen to him if he persisted in refusing a certain demand for money. It was dated three days before his death, and he was given one day to decide his fate. The Gazzetta now boldly charged the Mafia with his murder. There were circumstances, also, connected with the second of the tragedies which seemed to point to similar influences; and the Gazzetta urged the authorities to do their utmost with this one very significant and unquestionable piece of evidence. The article was entitled 'Barbarism in Excelsis,' and was throughout a plain challenge to the Mafia to deny responsibility for the atrocities, if it dared.

Hitherto Douglas had, greatly against inclination, kept his promise to Maria Bassano about these horrors. He had found her very interesting in other respects. She had introduced him to her lover, Marco Merano, a somewhat simple-faced greengrocer of the Via S. Giuseppe, and also to a certain sleek but not simple-faced Count Enzio Masuccio; and his imagination had easily seen substance for real drama in the giddy girl's partitioned friendship between two such men. On but very feeble encouragement he believed she would have admitted him as a third sharer in the affections of her too-large heart.

So far from bidding for this privilege, however, he had ventured to point out to her some of the dangers she was, in his opinion, confronting so gaily with the Count. She had told him that he loved her, and that it was an amusement to her.

'Signorino mio,' she had said, 'one is not young for ever, and why should the rich have the pick of the pleasures? All in good time I shall settle myself down with Marco; but before then I am free to enjoy the sunshine in my own way.'

'You like to play with fire—is it not so?' he had asked, shaking his head, yet smiling as he thought of the miraculous luck by which Southern ladies do escape the shipwreck they seem to court.

'Why not?' she had responded, with ready laughter. 'One need only warm one's hands at the flame, not scorch them.'

'And your Marco—if he were to know?'

'Ah, but what prudence, caro signore!' she had exclaimed, with a reproving click of tongue to

teeth, as if he were quite a baby in the ways of a world like hers. 'Il Signor Conte has many pairs of boots in his wardrobe. Where there are so many, repairs are always necessary. My Marco does not know the gentleman, but my father is celebrated for his work. There is no more clever repairer of boots in this quarter of the city. You understand, signorino? Masuccio is but a customer like others. He pays me for my smiles, signore, even as he pays my father for his stitches. What would you have?'

1 35

Douglas had seen the Count twice in these four days, the second time with a parcel in his hand. And he had liked his looks less the second time than the first. He had also summed up the simple Marco as a youth of spirit when roused, though his nose was a coarse, thick, snub thing, and his eyes were downright Italian, with immense eyebrows to them which

suggested much latent power of action.

But this was all mere castle-building of a sort, and outside his own especial province. Now, with the Gazzetta before him, he rang his bell in the Via Corta, and in spite of his promise meant to show the news to Maria. He rang again after a time. Perhaps a customer was keeping the girl.

And then, with a deferential murmur, the cobbler himself appeared from his workshop in the attic,

with his leather apron on.

'Oh, never mind,' said Douglas; 'it is not so important. I will not disturb you, Signor Bassano."

'My daughter has gone to the church, signore,' said the cobbler, pink-eyed as usual, and with a trembling lower lip. Douglas always felt sorry for the man, and his air as of one silently begging for mercy after judicial or other condemnation. He viewed him somewhat as a genius in his own humble way, whose nerves were ridiculously sacrificed to the task of maintaining his fame as an unrivalled mender of boots-a cobbler with ideals. Well, that was something, even though his constitution might be too weak for an easy pursuit of such excellence in the control of leather.

But in the act of dismissing the cobbler to his

last he changed his mind.

'By the way, have you seen this, Signor Bassano?' he asked, pointing to the 'Barbarism in Excelsis' column of the paper.

'Your goodness wishes me to read it?' questioned

the cobbler, fumbling at his spectacles.

'Well, you might like to glance at it,' said Douglas; and, rising, he went to his window and its finger's-breadth view of the Castello in the distance.

He lit a cigarette. A street-seller below sang 'Beautiful sardines, fresh from the sea!' and proclaimed his beautiful sardines three times thus ere Douglas turned to look at his landlord. Instantly he

aw that something was troubling the man. The cobbler's hands were shaking violently, and the paper between them, as if he and it had become paised. His face was bent over the sheet, and his lower jaw had fallen so that Douglas could see the very positive ruin of his teeth far back. Then, before Douglas could utter a word, the paper slipped to the floor, and the cobbler pressed his palms to his head.

'Mother of God!' he wailed, 'protect me and my poor little house! Oh, my daughter! What misery! What mis'— He stopped abruptly, stared at Douglas with his pink-rimmed eyes, and smost regained his composure. 'It is nothing, ngnorino, he whispered. 'The signorino will graciously excuse me?' And, with a very humble bow, he sidled away and shut the door behind him.

Douglas heard his irregular footfalls on the staircase, then a shuffling and a thud. And then, haring other sounds below, and supposing Maria had returned from her devotions, he opened the door and all but collided with a gray-bearded dwarf of a man no higher than his armpits, with large, close-laid ears that deepened the grotesque impression he made. 'Oh!' Douglas exclaimed.

But with a curt gesture the little man passed

'lam of the family,' he said gruffly, and went on up to the cobbler's den.

feeling excited, he scarcely knew why, Douglas bow took his hat and the paper and descended the stairs, this time to find Maria herself, prayerlook in hand, on the threshold of the house.

lam going for a little walk, he told her. 'Your luber has a visitor. Perhaps it were not uncivil to all him half a visitor, he is so small. He came in

The girl hastily crossed herself.

A deformed old man, signorino?' she asked in a w voice, with fear in her eyes. Precisely. But what is the matter?'

Maria Bassano was briefly convulsed like her while she shook, her bosom swelled and relled; and then, with a sob of breath, she rushed

Douglas would have followed her, but she waved him back.

(60, caro signors /' she whispered, with the fear full poiling her beauty. 'Go away!' She snatched ther rosary, and he left her clinging to the beads and rapidly parting them, with lips that seemed to te struggling dumbly in an effort to pray.

But yet another slight sensation was in store for Douglas this day.

Rarelling at the meaning of these extraordinary stations in Bassano and his daughter, he marched form the street towards the centre of the city, and To met by Marco Merano in his workaday blue bone. He did not recognise him until the man litted his cap, stopped, and spoke. You have your thoughts, signore, any one can

ee, he said jocosely.

'Oh, it's you!' said Douglas. 'Yes, I have my thoughts, as you say.'

He would have gone on; but the other's question, 'Is my little girl in the house, signore?' checked him.

'Yes,' he said. 'But-perhaps you will not be welcome to her at this moment. It is a guess of mine. There is a visitor, a small, stunted man with ears like an elephant's, who has upset her. He is with her father; but she'-

He got thus far before he realised the intensity of the change in the young greengrocer's countenance. Marco was gritting his white teeth like a dog, and there was a passionate beetling of those marked eyebrows of his.

'What is it now?' Douglas asked.

'A man so high, with a white beard?' retorted Marco.

'A man just so high, with a white or gray beard.' 'Then,' said Marco, 'may the Evil One seize him!' He whisked to the rightabout. 'I go your way now, signore,' he added. 'She will not speak to me for days, I think. She will weep and go to church more than ever, and I shall be to her as if I were not a live man. It has been so before. This Bolla-he has a power over her father which it torments her to see. The last time was when the poor Banti met with her end. She was then so ill, signors, that ... But why talk of it, especially when she would not forgive me if she could hear me? Do not tell her that you have seen me, signore. She has her moods, like other girls. It is nothing worse than that.'

But Douglas's mind was now keenly on the alert. 'La Bella Banti, you say?' he asked. 'She was of this street, was she not?

The young greengrocer pointed over his shoulder. 'Yes,' he said. 'That is where she lived with her mother as a young girl. She always retained an affection for the neighbourhood. When she wore diamonds like a princess and drove in her own carriage, it was still to Bassano that her boots and little shoes came to be repaired. From sympathy with the friends of her youth, signore.'

' Ŷes?' said Douglas, disguising his avidity. 'And that other, Andrea Guisano? He also lived here?' 'That is true, signore; and'-Marco laughed rather

bitterly, as if he resented the inclination at such a time-'it was the same with him, signore, as touching his boots. Bassano worked for him as for the poor Banti. Corpo santo! that is what disquiets me. After the Guisano tragedy I jested with Maria in saying that it was a fatality for her father to mend a man's boots, and she was furious with me. It will be the same again unless I hold my tongue. Name of a she-dog! And that ugly little Bolla here as before! But I turn off by this street. To the pleasure of seeing you again, signorino!'

'One moment,' said Douglas. 'This Bolla, you call him? Do you tell me he is, as it were, a coincidence with these mishaps?

'I do not know, signors,' replied the young green-

grocer, with the appearance of suspicion now in his eyes. 'It is not to be talked about. A rivedere!'

He strode across the road.

Douglas turned to the window of a little wineshop and understood why his heart beat so fast. He read the cardboard slips in the window about good red wine at twenty, thirty, and forty centesimi the litre, and told himself that at last he had a clue to the mystery of the exploded five. He could see not at all whither the clue positively pointed. He knew only that a voice had cried joyfully within him, and that his whole brain approved the cause for such exultation. For many minutes he gazed absorbedly at these intimations about cheap red wine. The wine-vendor himself showed a head behind them without disturbing him. Even when the man hung up a new card, announcing excellent white wine of Asti at fifty centesimi the litre, side by side with the others, Douglas paid heed neither to it nor the cunning merchant's face.

He was groping all the time, like a man in the dark who knows for a truth that there is something to be found. What should he do? And then he decided that he would take the most obvious of courses. He would wait and follow this deformed imp of a Bolla. From the wine-shop window he commanded a view of the cobbler's door at the end of the street. He watched zealously for five more minutes, with his back to the advertisements of the good and excellent wine; zealously, yet with dissimulation, smoking and reading to some extent at the same time.

Then, whom should he see come round the corner from the Piazza d'Armi but the well-groomed Count Enzio! He just obtained a glimpse of the gentleman's slender form, pinched at the waist, and of the red flower in his button-hole. The next moment the man had entered the house without knocking. To be sure, the door was generally thus open to the turn of a handle; but Douglas had learnt that the conventional thing to do was to knock before entering.

Leaving the wine-shop, Douglas returned slowly to his lodging. He had some notion that a general embroilment might ensue in that modest house; and if so, it were perchance some advantage to him to take a hand in it.

Nor were his intuitions altogether at fault here also. He found the door open, and the Count, with an inflamed face, on the point of passing towards the pavement. Farther inside was Maria, also red-faced and excited, though with tears on her checks.

The separation between them was immediate when Douglas appeared. With a sweep of his lat, the elaborateness of which hinted at irony, Masuccio stepped from the house, and, after an unfriendly gaze at Douglas, vanished round the corner. The girl rushed from the hall into the little shop to the right; and there, when he presumed to follow her, Douglas found her almost doubled on a chair, rocking herself and shedding abundant tears.

'My dear child,' he said, 'what is it all about? What has happened to distress you?'

She did not reply, but wept on.

Upon the counter was a neat parcel, tied with white tape, evidently, from its shape, containing a boot.

'Tell me the trouble, little one,' Douglas urged, as he looked at the snowy parting in the girl's black hair. 'Has he—that fellow—insulted you?'

She glanced up then with an expression in her tear-charged blue eyes for which a romantic artist might have paid a good price.

'Is the door shut, signorino?' she whispered.

He shut it softly.

'We are alone,' he said.

Then Maria Bassano burst forth.

'I wish he was dead, signorino,' she cried. 'And I wish further that I was in Paradise with my dearest mother. This wicked earth! But no—I will not do it. I will be true to my Marco.'

'The Count'- suggested Douglas.

'Yes, signorino,' she exclaimed, responsive to his prompting. 'He threatens that unless I consent to sacrifice myself to him to-morrow he will make a scandal of me. He is so enamoured. I did not think he had such a heart of fire. I do not love him-no; but I have taken his presents, many of them, and he has twice kissed my lips, and I am a very unfortunate young woman to have let him go so far. He desires to carry me away to his country house by Bologna. Do I say desires? He insists. And he tells me that if, when he comes for his miserable boot in the morning-there, behold it by your hand !--if I am still obstinate he will find out my poor Marco, and-and- Ah! but who shall say what will then come to us all? They will perhaps fight, and I at least shall be disgraced. Signorino, I hate him worse, I think, than that other. What a house is this!

'Poor little girl!' murmured Douglas, stroking the coarse black hair of her head by the broad parting. 'But, you know, I told you before'—

She shook off his hand.

'That is not all, care signore,' she almost screamed, with a fresh flood of tears, and the terror as before staring through the tears. 'There was my poor father lying like one dead on the floor upstairs. He, that accursed other, found him so. I would not help him to his senses at first, when I saw for what purpose that other had come. But it is enough, signorino! I must not talk. This is no house for so gracious and kind-hearted a stranger as you, signorino. Would to heaven my poor father could escape from the city! That is what I have begged and begged. We are of Parma ourselves. There are our blood-relatives, and there we might live happy and peaceful lives, with perhaps Marco, if God willed-if-if things were otherwise. It is because of a weakness of mind in my poor father. But come, I must be courageous and wipe my eyes, signore.

She stood up and jerked her thick black plait

behind her, tried to smile, and used her handker-chief to her face.

Douglas himself was more perturbed now than the seemed.

'That is right. Courage! courage!' he said at a renture. 'But you talk of the man Bolla, do you not—him with the ears?'

The girl's hand clenched into a fist by the side of the Count's parcel, and her full rosy lips tightened grinly. She drew breath before she replied.

'No, signore, I talk not of him. And, excuse me, but it is the hour when Marco comes sometimes.' Stored another smile; without much difficulty either, thanks to her blessed mercurial temperament. 'Marco will not like it if he finds you here with me—thua'

'He will not come to-day,' said Douglas thoughtlasiy. 'He was in the street just now when that other—But for charity's sake don't glare at me The girl's temper had taken yet another turn. No turkey-cock in Douglas's experience ever swelled out so indignantly as she under the digestion of this trivial intelligence about her Marco. She seemed to put on inches of stature, and the flashing of her eyes, the scorn and wrath—he had never seen the like on so pretty a young face. She said something first in dialect that Douglas missed. Then out shot her arm as she pointed to the door.

'Go, signore! Have the kindness to go from this room. I command it. Without words!' she cried, as dignified as a stone Juno.

Hat in hand, Douglas obeyed.

'Certainly,' he said, 'certainly. I am sorry if I have said anything to annoy you; but, remember, I am your friend.'

'I want no such friend, signore,' she said, her eyes like lamp-lit blue diamonds. 'Do me the favour to withdraw.'

(To be continued.)

WHITE ANTS.

HITE ants are a never-ending trouble to the Australian settler. From the earliest period of the white man's residence on the shores of Botany Bay the fragile little creature has

waged a continuous war against him by attacking, dismantling, and in many cases devouring the most cherished of his possessions—his long. Before the white man's advent houses were mknown. The aborigines of the vast territory knew athing of such structures, a few sheets of bark constituting the shelter they temporarily required. But even then the white ants abounded. They ate the standing trees in the forest; they devoured fallen branches; they made nests in logs and roots. From Port Darwin to the south of New South Wales etilences of their activity in far-off times exist in be remains of huge mounds, the labour of millions tpon millions of the tiny insects. With civilisation ad house-building came new spheres for their Minity. Wherever woodwork was used, in city eate or bush hut, the creature had to be guarded Chast, and the utmost care and precaution were often futile in the contest. Buildings in the capitals hare had to be remodelled and sometimes taken form because of the extent of the ravages. A building in the country known to be affected with this anis becomes practically unsaleable. Occasomely the affected board or joist or several affected One are removed and sound timber introduced, in the hope of making good the injury; but rarely does

The white ant is an unseen worker. It may have sourced a lodgment in a house many years back; sections of the creature may have lived and without creating by sound or otherwise the slightest suspicion of their presence;

and it is only when they have consumed the entire substance underneath that the shell of the wood falls in and disaster is revealed. Governments have spent tens of thousands of pounds experimenting with preventives, and individuals have expended even more; but the white ant is now as much a master of the situation as at any time in the past.

It may be necessary to say that the insect, though popularly known as a white ant, is from a naturalist's point of view not an ant at all. It belongs to the Termitidae group, with distinct habits and a distinct life-history. It is only about forty years since it was taken up as an object of serious study; but in that short time there has accumulated about it a literature valuable to the naturalist, and interesting—however painfully so—to all who directly or indirectly come within the sphere of the creature's operations.

It is a tiny creature, about a quarter of an inch in length, and so slight that even a gentle touch of the fingers squashes it. The community has three bodies: the queen, workers, and soldiers. The life of the nest centres in the queen. She is larger, many times larger, than any of the workers or soldiers, and several cells near the foundation of the nest are placed at her disposal. In these cells she deposits eggs, and to the preservation of her and her eggs the tireless industry of the community is directed. The soldiers literally represent men under arms. They stand about the passages or openings as if at attention. They closely observe all that goes on, but do no menial or labouring work. The food is carried in and the litter carried out, but the soldiers lend no assistance to either batch of workers. Strike the nest, however, with a stick, and they will promptly rush to the spot. Make an opening, and they will stand in the aperture and menacingly

snap their jaws together. When the assaulting enemy has gone away they supervise the repairing

of the damage done.

These ants build in the most dissimilar places. At the root of a tree, in the branches, under a heap of stones, on the barren plain, on the floor or roof or mantelpiece of a dwelling, the pulpit or altar of a cathedral, or in the columns or cupolas of public buildings, white ant nests may be found. They may tunnel underground, showing no visible indication of their existence, or build mounds eighteen or twenty feet high, challenging the attention of all who pass; but wherever they live they are equally obnoxious to man and his works. It was at one time thought that far off in the bush they existed on decayed vegetable matter, and thus performed a natural service in freeing the plains from litter. But experience shows that they have no special liking for decayed timber; rather, in many situations, it has been proved that they passed by decayed in favour of sound wood. Sound soft wood such as deal is most to the white ant's taste; but sound hardwood, even ironbark, it will tunnel long distances to reach. Its instinct for finding nutritious food leads it long journeys from home. Through four or five inches underground it will bore in a straight line, if the soil permits, to a standing pine or tallow wood; and if a rock obstruction intervene, it will turn the corner by the shortest curve and go straight for its object. When it finds the distance too far for a day's journey it constructs depôts midway, or a fresh colony is formed.

The great mounds that are so common a feature of Australian scenery are beginning to excite the interest they deserve. These white ant nests are among the marvels of insect architecture. In various parts of New South Wales, in Queensland, and the northern territory of South Australia, mounds up to twenty feet high and a dozen feet in circumference may be met. They look like the work of man, though their purpose would puzzle the most resourceful. A few early observers judged them to be tombs of members of the black race, or monuments to commemorate important incidents. When their origin and use were settled, the reason for heaping them up so high became the tantalising question. That question must remain unsolved for some time yet. The lofty structure exposes the inhabitants of the nests to the assaults of enemies. The white man, as settlement advances, clears them out of his way. He finds that the material of the nest makes a very good substitute for cement as a floor for his bush hut. It takes some labour to break the stuff up; but when broken up and pounded together it is almost watertight and proof against the teeth of rats and mice. Before the advent of the white man, the mound, seen at a distance, attracted, and even yet attracts, the hungry black man. He rather likes white ant as a repast. It satisfies hunger and stimulates him, owing to certain ginger-like properties the food possesses. A few black fellows will devour

a million of the insects in a day, and were the mounds less difficult to smash up the repast would be more frequently enjoyed.

But the height of the mounds is not the only perplexing feature of this architecture of the creatures. One family builds a nest so that the long axis runs north and south. nest has, therefore, its sides exposed to east and west. That insect is known as the compass or magnetic ant; and the only explanation available of its peculiar building habit is that by offering the sides to east and west it exposes the largest possible area to the tropic sun; and this, in regions where heavy, saturating rains are frequent, enables the architect to obtain a dry home in the shortest time. A study of the habits of insects reveals so many subtle adaptations to natural surroundings that one is not astonished even at this claim.

A white ant exterminator has been the dream of many inventors. There is no doubt that where a nest is built in an accessible spot, and the underground avenues can all be commanded, extermination of a particular colony is possible. It has actually taken place under the writer's observation. The bed was dug up and the ground around a radius of fifty feet turned up and trenched, and a liquid mixture of washing soda and arsenic poured over. Usually, however, when ants are discovered it is too late to apply this drastic treatment. The ants may be already in the house or building, or they may be carried in in the next load of wood cut for the fire, or they may come home in a walking-stick. At the swarming season they may even fly on to the roof or make their way through the windows. Thus, extermination in the manner stated does not afford complete security if white ants exist anywhere in the neighbourhood. Of course, comparative security is worth striving for, and consequently almost every one in ant-infested country exterminates where he can, and adopts every preventive within his reach. In many parts the houses are built on blocks capped with zinc, and salt and tar and a number of other ingredients supposed to be odious to the insects are spread about.

Invention also exercises itself in trying to make timber antproof. Fumes of carbolic acid have been injected into building timber; but so far, the fumes have been found to pass away, while new colonies of ants swarm. and stone and as little woodwork as possible would seem to be the building rule most likely to yield satisfaction. Where bricks and stone are procurable the rule is, indeed, generally followed; but over a large part of Australia wood is practically the only material available. And in the cities, though bricks and stone are commonly used, some of the ancient wooden structures still exist. and afford homes for colonies of ants that spread around. The furniture of many houses, even new stone ones, is ant-eaten. A library-case has fallen to pieces and chairs and tables have collapsed in stone houses where, until the disaster, it was believed no ant had entered. One of the largest public buildings in Sydney was lately found to east-infested. An ornamental piece of woodwork on a column of marble was tunnelled by the tiny creatures. In that case, and in others, ex-

amination led to the conclusion that the swarming ants, when their wings can carry them to a fair height, had flown from the trees in the street through the windows of the buildings, and had kept in flight till they found some wooden projection on which to rest and make a home.

THE CHARM OF SHAKESPEARE'S COUNTRY.

O county in England has been more visited by strangers within the past hundred years, or has been more written about, than Warwickshire, the cradle of our great dramatist,

whose works have been termed 'our country in a concave magic mirror,' and whose shrines—even more than those of Scott at Abbotsford or Dryburgh-draw pilgrims from all parts of the world in increasing numbers. It has been aid that one hundred thousand visitors come to Stratford-on-Avon in the course of a year. Some thirty-four thousand at least visited Shakespeare's birthplace in 1905, three thousand of whom were Americans. Stratfordians are now no longer maware, as when the dust of Shakespeare was laid in the chancel of Holy Trinity Church, that his life, in insurance language, was one of the most valuable in England at the time. The fact that he was lom and buried in Stratford has brought prosperity to many and an annual shower of gold to the town. No writer helped the sentiment more than Washington Irving in his essays in the Sketch Book, written n the Red Horse Inn, Stratford, wherein he points out that 'the mind refuses to dwell upon anything that is not connected with Shakespeare. The whole place seems but his mausoleum.' Sidney Lee no omit approves of Marie Corelli's advice to Stratlord, to 'lean its back to the wall of the sixteenth century, and refuse to budge,' and conserve what remains of old-world interest. The most casual ristor can see that the magistrates and natives are fully alive to this.

But Stratford-on-Avon, although the most powerin magnet, by no means exhausts the interest of Warnickshire, for this noble county, set in the heart of England, has other claims on our attention, with its picturesque scenery, leafy lanes, old manorhouses, and antiquities domestic and ecclesiastical. The brisk manufacturing towns of Birmingham and Corentry are great industrial centres; Leamington as a reputation as a watering-place; while Warwick by) has its castle—a noble survival, and headworth (in the district) a noble ruin glorified athe pages of Scott. The cities are great workshops; in there are refreshingly quiet villages and hamlets, to the rest is a great garden of diversified and tre-changing beauty. Eminent persons, also, either in birth or residence, have lent interest and lustre to the county, including Sir William Dugdale the atiquarian writer; the poets Michael Drayton,

Richard Jago, and Somerville; Walter Savage Landor of the Imaginary Conversations; Joseph Addison, who wrote some of his Spectator essays at Bilton House, near Rugby; Dr Arnold of Rugby, most famous of English schoolmasters; William Hutton, the historian of Birmingham; Dr Priestley; John Henry Newman; and John Henry Shorthouse. author of John Inglesant. Marie Corelli, who now resides at Mason Croft, Stratford-on-Avon, came to Warwickshire in 1898. Ellen Terry, in a letter in the Shakespeare Museum, confesses in a pleasant way that she hails from Warwickshire; while George Eliot, especially in Scenes from Clerical Life and Adam Bede, has given us fresh and vigorous pictures of life and character in north Warwickshire, in the Nuneaton and Bedworth districts. To the American eyes of Hawthorne, who lived for a time in Warwickshire, the great charm of English scenery was in the rich verdure of the fields, in the stately wayside trees and carefully kept plantations of wood, and in the old and high cultivation which 'humanised the very sods.' A writer in the Athenaum has called it 'a county of bright skies and short distances, of homely, concentrated interests, of agriculture and sport, yet also of manufacture and mechanism; a county, too, which has kept pace with English life as it advanced.'

To the ever-increasing literature of the county of Warwickshire has been added Warwickshire (A. & C. Black), with seventy-five illustrations from paintings by Fred Whitehead, R.B.A., described by Clive Holland, who calls it one of the most lovely of English counties. He says that 'though lacking the peaks and deep-set dales of its near neighbour Derbyshire, which it touches at its northern limit, it is essentially a county of pleasant hills, uplands, and fertile, well-watered vales. Some of the richest meadow-land and most picturesque woodland scenery in the Midlands lie within the confines of Shakespeare's shire.' The early history of the county and that of its chief towns is pleasantly given by Mr Holland, while the artist does his part well. The reader who is going to Warwickshire, or has just been there, may profit by the united efforts of author and artist. Much of the delight and profit received by travel consists in reading wisely before and after a journey. A fault of our systematised methods of travel is that so many people just see what every one else before them has seen. There is not much room for deviation and original research. Yet it is a great

joy to discover something not set down in books: a noble view or something of historical and literary interest. The shows of nature, continually changing, are for all who have eyes to see and hearts to feel; and one never tires of leafy lanes, lined it may be with elms or limes or chestnuts, wheat-fields at sunrise or sunset or when waves of shadow move over them. This book will recall leafy Warwickshire at its best: the towns of Stratford, Leamington, Warwick, Kenilworth, Birmingham, and Coventry, as well as many a manor-house or quaint village, with half-timbered houses, and lilies and roses and old-fashioned flowers growing in the gardens in front. There is less than there should be of George Eliot and her country here, and of Rugby and Dr Arnold, but abundance in picture and text to form an admirable souvenir of the county.

We realise in reading the book that Birmingham, that brisk commercial town, is not wholly given over to the industries; one of its representatives in Parliament is a novelist. The town has fine public parks, and the Cadburys have given an object-lesson in regard to the housing problem and sanitary reform at Bournville. Birmingham University and its other educational institutions are well to the front. In the Art Gallery and Museum, while there is a good representation of the best works of our famous artists, will be found many specimens of David Cox and Burne-Jones, who were natives. The catalogues of the Art Gallery are models of their kind, and enable the visitor to profit fully by what he sees. In addition to names already mentioned, those of Matthew Boulton and James Watt are inseparably associated with the town, as in the Soho Works the steam-engine was perfected. Matthew Boulton said truly, 'I supply here what all the world desires to have-power.' William Murdock, inventor of gas, was also associated with Boulton and Watt. Dr Darwin is another contemporary, while more recently the names of Sir Josiah Mason, Elkington, Ryland, Jaffray, Tangye, Feeney, Timmins, Muntz, and George Cadbury figure as benefactors to the town.

Mr Clive Holland gives the history of the town in detail: its sacking by Prince Rupert and its marvellous progress during the nineteenth century. Coventry, which has exchanged its old celebrity in ribbon-making for a modern reputation in the department of motors and cycles and other manufactures, comes in for adequate treatment; as also Warwick and Leamington. would almost seem that we must dismiss the legends of Godiva at Coventry and Guy of Warwick to the region of myth. Guy may have been a Mercian warrior who successfully resisted the Danish invaders in the tenth century. It is strange to meet with the wonderful Warwick Vase in the grounds of Warwick Castle, a trophy from Hadrian's villa near Tivoli, which stands so utterly despoiled near Rome. Compton Wynnyates and Aston Hall, and many another manor-house and village, find mention here. Aston Hall, that fine

Elizabethan mansion, in a suburb of Birmingham, is now a corporation gallery and museum. Dugdale called it 'a noble fabric, which for beauty and state much excelleth any in these parts.' It was built by Sir Thomas Holte in 1618-35, and here he entertained Charles I. when on his way from Shrewsbury to relieve Banbury. In 1643 the Hall was attacked and taken by the Parliamentary army, and the marks of the cannonading are still visible on the walls of the south-west wing and in the balustrade of the staircase.

Nathaniel Hawthorne terms Leamington one of the cosiest nooks in England or in the world, and a home for the homeless all the year round. Here, at 10 Lansdowne Circus, he wrote chapters of Our Old Home, and completed and revised his Roman story Transformation. Charles Dickens was here in 1839, and made notes for Dombey and Son. John Ruskin was amongst the visitors in 1843. It has a beautiful situation, is connected by electric tram with Warwick, and is a good The Warwick historical centre for excursions. pageant of July 1906 will long be remembered. Its success may be gauged from the drawings, which amounted to thirteen thousand pounds, although the expenditure was eleven thousand pounds.

The visitor to Warwickshire is well advised who reads or re-reads Adam Bede or some other of George Eliot's early novels. 'There is nothing,' says William Sharp, 'of more winsome charm in George Eliot's writings than her description of this very real and intimate country of her life and knowledge. In the introduction to Felix Holt, in Scenes from Clerical Life, and Adam Bede she recalls the district in and around her native parish of Chilvers Coton in the Nuneaton and Bedworth district; in Middlemarch there is an echo of her Coventry experiences. The Floss, in The Mill on the Floss, is the Trent at Gainsborough, however. She painted the country as it was before its picturesqueness was destroyed by smoke from mines and coaltrains. Her roots went down in the pre-railway days, which she realises in a wonderful way. The father of Mary Ann Evans was an estate agent when his gifted daughter was born at Arbury Farm in 1819. Next year the family removed to Griff, an old red-brick house on the Arbury Robert Evans afforded his daughter suggestions for the character of Adam Bede and Caleb Garth, as her mother did for Mrs Poyser. Rufus Lyon and Esther Lyon in Felix Holt had Coventry prototypes. A story which she heard from her Aunt Elizabeth, who had been a Methodist preacher, was the germ of Adam Bede, as this aunt supplied in turn hints for the character of Dinah Morris. At Wirksworth there is a Bede memorial chapel, 'To the glory of God and in memory of Elizabeth Evans, immortalised as Dinah Morris.' Mary Ann Evans had been a boarder from 1831-35 in a large, square-fronted, white house in Coventry, at the corner of Warwick Road, leading to Hertford Street, nearest the

station. Later, the school was removed to Hertford Place, and here she had lessons in singing from Signor Brezzi of Learnington. Afterwards the school was in Little Park Street. It was Warvickshire that afforded the finest characters, scenes, and incidents for this novelist; as Sir Leslie Suphen puts it, 'her early memories had given the best results.' There were sixteen thousand copies of Adam Bede sold within a year of publication, and Messrs Blackwood generously doubled the sum of eight hundred pounds which had been paid for the copyright and returned the book to the author. 'My stories grow in me like plants,' the remarked. 'Shall I ever write another book as true as Adam Bede?' In the enthusiasm of a inst perusal, Charles Reade said it was the finest thing since Shakespeare! It will be remembered how George Eliot brings Hetty Sorrel twice round by Stratford-on-Avon, and how she characterises the grassy Warwickshire field, with the bushy, tre-studded hedgerows that made a hiding-place eren in the leasless season, a feature which also sruck Nathaniel Hawthorne.

'What a hardy plant was Shakespeare's genius, suce it could not be blighted in such an atmo-"bere!" was the thought of one eminent visitor to as birthplace. 'From the people is invariably om the prophet' was the thought of another. Sidney Lee points out that while in the country Statespeare eagerly studied birds, flowers, and trees, and gained a detailed knowledge of horses and dogs, which would not be difficult, as all his ansiolk were farmers. Then he knew about having, hunting-Warwick being the third best country for this-coursing, and angling. Charlecote tradition points to his knowledge of posching also. He had that 'intuitive power of radising life in almost every aspect by force of his imagination, while his genius did not stand in the arof his being a successful man of business. After the cloudy word-spinning about Shakespeare, on comes back to reality in reading the very in tributes by men who knew him. Heminge ed Condell, in the first folio of 1623, say: 'His and and hand went together, and what he thought is attered with that easiness that we have scarce recired from him a blot in his papers. . . For ni rit can no more lie hid than it could be lost. le lonson wrote of Droeshout's engraving in the

Oh, could be but have drawn his wit As well in brass as he hath hit His face, the print would then surpass All that was ever writ in brass.

Firther, 'I loved the man, and do honour his sensory on this side idolatry, as much as any. He was (indeed) honest, and of an open and free things; had an excellent phantasy, brave notions, at the state expressions.

At the tercentenary in April 1864 Chambers's stirely devoted to his memory. This was ex-

panded and amplified into a shilling volume by Mr Evan J. Cuthbertson and published by Messrs Chambers. Robert Chambers wrote an interesting narrative of what took place at the Shakespeare Festival, which was published in this Journal, May 28, 1864.

Since Robert Chambers wrote about the Shakespeare Festival of 1864, the Memorial Theatre, with its picture gallery and library, has been erected beside the winding Avon. In George Macdonald's Orts an essay is printed, dated 1864, with a suggestion for just such a building. On a fine day a most enchanting view of Stratford may be had from the tower here. The library has more than ten thousand volumes relating to Shakespeare, with the original painting from which Droeshout engraved the portrait in the folio of 1623. The fountain and clock presented to the town by the late Mr Childs of Philadelphia, the American window (1885) in the north side of the chancel of Holy Trinity Church, another window unveiled by Mr Bayard, the Carnegie Free Library next to Shakespeare's birthplace in Henley Street, and many houses in the suburbs are a few of the adornments since that date, some of which Marie Corelli calls disfigurements. This lady novelist prevented Sir Theodore Martin, by the outcry she raised, from placing a monument to Lady Martin in the chancel of Holy Trinity Church, opposite the bust of Shakespeare. She failed in the case of the Free Library; and no one can say that this building is not in excellent taste, although the annual income of one hundred and fifty-six pounds is miserably inadequate.

Shakespeare's birthplace in Henley Street was purchased by public subscription in 1847, as a national memorial, for three thousand pounds. New Place, where Shakespeare lived and died, at the corner of Chapel Street and Chapel Lane, was purchased by public subscription in 1861, and Anne Hathaway's cottage at Shottery in 1892 for three thousand pounds. The Shakespeare birthroom is scribbled with names of distinguished and undistinguished people like a badly kept schoolroom. The signature of Byron has been defaced from the plaster; that of Robert Browning is on the ceiling; Scott and Carlyle figure on the window. Two visitors, Nathaniel Hawthorne and Hugh Miller, felt it would be sacrilege to write their names there. The old visitors' book has the signature of Scott, who was at Stratford in 1821 and again in 1828; that of Washington Irving also appears; Charles Dickens was here in 1838 and 1840. Other signatures are those of A. and B. Mendelssohn, Florence Nightingale, 'John Ruskin, junr., May 25, 1830, in a boyish hand, Dionysius Lardner, Countess Guiccioli, Jane Porter, N. P. Willis, Lady Shelley, Halliwell-Phillipps, Daniel Webster, Lady Blessington, our King as Prince of Wales, and General Booth. The building memorable as the birthplace is formed of two houses communicating with each other. In that to the west, which is entered first, the room

on the upper floor is where Shakespeare was born and spent his childhood. The house adjoining, which communicates with it, was also the property of Shakespeare's father, and used as a storehouse for agricultural produce. It is now a museum and library, in which are gathered relics, books, manuscripts, first editions of his works, and all that can illustrate his life and times.

No more patriotic Scot than Hugh Miller ever visited Shakespeare's shrine, and yet he tells us in his First Impressions of England that Robert Burns and Walter Scott rolled into one would not make one Shakespeare. Next to the Bible, the great dramatist comes as our best selling author. One of his editors, the Rev. W. Harness, said: 'There never was such another man, and there never will be.' To be able to write a good essay on Shakespeare, in the opinion of Mr Augustine Birrell, might form the best possible test of an English man of letters. Had we a British Academy there need be no other passport of admission. Flowers are strewed on his grave on his birthday each April, and there is an annual series of dramatic performances in the Memorial Theatre. As Robert Chambers wrote in his 'Shakespeare Festival' article, though his biography is lamentably meagre, 'yet of few great men of three hundred years ago can we say that they are so clearly connected with topography. We have not merely the natal town-still a small town, and with many of the features of his timebut we have preserved to us the plain half-timber house in which he was (in all probability) born, the school in which he was educated, the base of the walls and the garden of the goodly house in which he spent his years of dignified retirement, and finally the graves of himself and his kindred occupying a distinguished and prominent situation in the chancel of the beautiful parish church.' To meditate on these spots, to hear his wonderful words in a temple which had risen not two hundred yards from his tomb, made the writer, as it does every visitor, feel the man Shakespeare to be more a reality than ever. And so, according to Carlyle, he receives homage from all the world, 'that beautifullest English soul that England confesses to have ever made, the pink and flower of remembered Englishmen, the greatest thing that it appears we have yet done, and managed to produce in this world.

It is surely matter of regret that amongst the numberless editions of Shakespeare—of which there are said to be eleven hundred in English alone, and a very valuable one which has been produced at Stratford—misfortune robbed us of a projected and partly completed edition in ten volumes by Sir Walter Scott. It was commissioned by Archibald Constable in 1822; the editorial fee was to be two thousand five hundred pounds, and J. G. Lockhart was to lend his assistance; but the commercial crisis of 1826 put an end to the scheme after three volumes had been printed. These were sold in London as wastepaper. One

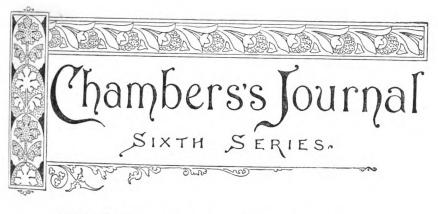

need hardly remark what an interesting find any of the three volumes would be, with the notes of the great novelist on the great dramatist. Our interest in him is not lessening; for the first, second, third, and fourth folios changed hands lately for ten thousand pounds. And quite a romance was the purchase by the Bodleian of the first folio of 1623 for three thousand pounds, a book which had originally been on the shelves of that same library and had been sold for a trifle. It appeared in the supplementary catalogue of 1635, but not in the catalogue of 1674, having probably been sold, according to a rule laid down by Bodley, as a surplus book on the appearance in 1664 of the third folio, which would be regarded as a more complete edition. There are one hundred and seventy-two copies known to exist of the first folio in Great Britain and America.

Mr Sidney Lee, who has weighed every fact in the life of Shakespeare, and has written quite a model little volume upon Stratford-on-Avon, tells us that the origin of the town and its development in the sixteenth and early seventeenth centuries alone afford a profitable study to students of the great dramatist. He considers it useless to estimate exactly how much Shakespeare owed to Stratford, for 'he did gather the humours of men daily wherever he came.' We must be content to marvel how, in the aspect of the town and country, fair as the latter was and is, in the petty details of Stratford daily life his mighty genius found adequate nourishment. Mr Sidney Lee concludes that 'it is vain to endeavour to solve this mystery, or to strive to indicate either in the world of living men, or in wood and stream and field and hill and ocean, "all he had loved and moulded into thought."'

THE WINDOW.

Some may have their solitudes Of spacious glades in leafy woods, Or sunlit meadows stretching far, Where with green grass white blossoms wat: Or high-walled gardens, rose beset, Where never wakes a wind of fret, But morn to even, all day long, Bird after bird maintains the song. Mine own soul finds, whate'er befall, A cloister chamber white and small, Musicless and picture bare, But open to the salt sea-air. There my lone soul sits all day, Neither discontent nor gay, Looking from the casement high Across gray seas, beneath gray sky. What hath she hope to see afar? Perchance a sail, perchance a star. She knows not what her vigil means; Evermore she looks and leans. Through some mystic sense she knows Whatever fails, whatever goes, This window, o'er the sad, gray sea, Opens towards Eternity.

AGNES S. FALCONER.

THE GERMAN NAVY AT HOME.

ERHAPS the most abiding impression left on any one who has the rare experience of knowing the German Navy from inside is that it is yet in the making—incomplete; and a prolonged residence in contact with

it and within sight of its daily life will strengthen that conviction

The headquarters of the German Navy are nominally at Kiel. But Kiel is on the Baltic; and when the canal was cut, in order to join its excellent harbour to the North Sea, German Dradnoughts had not been thought of, and there is no doubt that the 'mouse-traps' of the Baltic will be as dangerous to them as to the war-vessels of other nations. There are plenty of accidents to the existing ships as it is; and the canal is only eventy feet in width at the bottom, with a depth of thirty feet. Besides, it takes nine hours to pass through its sixty miles of length. A moment's reflection will convince any one that the North Sea will be the battle-ground of the German Fleet; and it is to the North Sea, therefore, that we must hold to see the German Navy as it really is, and

The German North Sea coast is not much more than a hundred miles long as the crow flies, and arrived miles long as the crow flies, and arrived miles long as the crow flies, and the sum of the sum of

Much of the German hostility to Great Britain at the time of the Boer war was caused by the bloom that they themselves were losing what we were figuring for. Apropos of their own South the statement of the statement war, an Ober-lieutenant said to me, obviously to one of a nation that had done likewise, 'We No. 481.—Vol. V.

don't shoot our prisoners. That would not do; they would scream over it too much in Germany and other countries. We put them at the end of the column under no guard, and when the column moves on and they try to escape—as they always do—then they are shot down.' It is true he was in the Navy, and not in the See-bataillons or Marines, the force concerned.

The great war-harbour on the North Sea dates only from 1855, when Prussia acquired the site from Oldenburg and started the making of a Navy. At that date there were only a few fishermen's huts in what is now called the suburb of Heppens. First one harbour was cut out of the land, then another, and then a third. Not until the time of the present Emperor, however, did the work progress with the giant strides it is doing now. Since his advent the expenditure on the harbours, forts, strategic railways, barracks, docks, and other buildings must have been enormous. And all this does not appear in the German naval estimates.

The entrances to the harbour are through locks, for there is not enough water at low-tide to serve. A large torpedo-boat harbour outside the dykes has only recently been enclosed from the Jahde-Busen, an inland circular bay about sixty miles in area formed by an inundation some hundreds of years ago, a great part of which is left dry at lowwater. An additional inland harbour is also being scooped out which will have a separate entrance to the channel of the Jahde. The soft, sandy nature of the soil may be gauged by the fact that quite lately the dam of the new building-slip for ships of the Dreadnought type gave way. This is one of the reasons why the new ships have not yet been laid down. The containing dyke for the new torpedoboat harbour (capable of holding a whole fleet of them) also had great breaches made in it no less than four times in one winter. So that, if excavations are easy, the maintenance of the work done is no light task. A large number of dredges have to be kept constantly at work in order to keep the channel of the Jahde free. Even now the largest battleships can only enter it with [All Rights Reserved.] FEBRUARY 16, 1907.

safety at high-tide. No wonder that the German Navy is casting hungry eyes on Holland.

All round the harbours great barracks have been and are still being built. Their size may be gauged by the fact that one, not the most modern, is called the 'Five thousand men' barracks. No bugle is used in German barracks or German warships to sound the hours, &c.; and but for the sounds of continuous drill in their parade-grounds, they stand silent all day long. Only at ten o'clock at night does a bugle sound for the closing of the gates, and then generally with some false notes caused by lack of practice. Mathematically ruled-out streets, planted with closely cropped trees, all exactly alike, make up the rest of the town; and into the dockyard, across the roads and everywhere, run railways. They would not be long in mobilising anything here. Thousands of workmen are employed in the Werft, as the dockyard is called. Their wages range from forty to sixty pfennige per hour, so that they are rather well paid as wages in Germany go. Their numbers have been more than doubled within the past three years. Wilhelmshaven contains about thirty thousand inhabitants, all of whom are in some way or another connected with the Navy.

No foreigner is permitted to inspect the dockyards without special permission-not easily obtained. Cases of espionage are not infrequent, especially by French artillery officers. The offenders are always sent to prison, and of course are disowned by their own Governments. Not so long ago an English yacht which anchored outside the harbour was stopped for some days; and its owners were not permitted to proceed until they had given a satisfactory account of themselves and it had been verified through the Embassy in London. It must be remembered that Germany is not a land where espionage is easy; for every one, native as well as foreigner, must register himself at the local policeoffice in person, and if a foreigner, exhibit a passport or his birth certificate. In the case of temporary guests, hotelkeepers have to notify the police. The carrier of a camera is well looked after. I remember on one occasion taking a pocket camera with me to the top of the water-tower with the idea of photographing the harbour. But I was stopped. I was afterwards able to buy a picture post-card panorama of it, which, it is needless to state, was anything but accurate.

The German Emperor has lately instituted a new naval rank-that of Gross-admiral (grand-admiral), corresponding to a field-marshal on land, and having a special flag at sea. His brother Prince Henry and Admiral Hans von Coester have been appointed to this rank.

Kiel is under the supreme command of Prince Henry, and Wilhelmshaven under Admiral Bendemann. The shore batteries (many of which are inland), and military as well as naval works, are all controlled by them; and when they are in residence an admiral's flag is flown from the Schloss.

When the harbours at Wilhelmshaven are complete, Einden (the most westerly port) will be taken in hand, and the existing commercial canal to the former place deepened and widened into one for battleships. There will thus be less danger of a successful blockade by a hostile fleet, for the two ports are fifty miles distant, and the coast in between is unapproachable. When Emden becomes a war-harbour, then will come Holland's danger.

Only those who have seen the German Emperor among his ships and men can thoroughly appreciate how completely he is the very soul of his Navy. He continually visits it, knows all his superior officers personally, and loses no opportunity of delivering one of those flamboyant speeches to his men which the world knows so well. At the annual swearing-in of the recruits before him he invariably delivers a speech or sermon to them, standing in front of a field-altar with crucifix and candles on it, and attended by a Protestant pastor and Catholic priest. On board ship, on Sundays, he always conducts divine service and preaches the sermon (generally written for him by a pastor). He is never seen out of uniform, one curious consequence of which is that he sets no lead in the fashions for civil dress. On the contrary, it is our peace-loving King Edward (so cordially hated and so much caricatured in Germany) who is taken as the model for men's dress. The Emperor's son Prince Adalbert is in the Navy. He is not popular among his brother-officers.

When at a naval port the Emperor sleeps on board a battleship, dining in the common room at the midday dinner of his officers at their Kasino. When the meal is over he almost always delivers a speech, and is said to 'let himself go' in the way of expressing his opinions a good deal more than he does in his other and more public speeches. As Emperor he is a very different person from what he is in private life. On hearing him speak in public it is impossible not to think of a drill-sergeant. The loud, harsh voice, the curt peremptory sentences, ending abruptly, irresistibly remind one of the drill-ground. But in private life he is all generosity, lavish even, to his officers, as his gifts of his yachts, pictures (his own drawings among them), books, and many other things show. One cannot help suspecting that the sudden and impetuous manner in which he sometimes acts is provoked by the chronic malady of inflammation of the ear from which he is said to suffer. It is generally forgotten, too, that his left arm is almost useless. It is four inches shorter than its fellow, has a malformed hand with only rudimentary fingers, and is quite limp and lifeless. At table he uses a combined knife and fork.

Among his personal tastes may be mentioned a liking for Dachel-hunds, erroneously called dachshunds in England. He has a liking also for Munich beer and Frankfort sausages, and always drinks Sekt (German champagne, which is not

champagne at all), and smokes the inexpensive ten psennige cigar of a thin Dutch shape. The partiality for the two last is partly dictated by atriotic motives. Lastly, he does not like Wagner | Kirche.

-thinks he is too noisy-and objects to the 'suffragette,' believing that woman's lot in life is to attend to the three 'K's'-Kinder, Küche, and

THE LORD OF THE MANOR.

CHAPTER XIII.

EEDLESS of these drastic changes, the lord of the manor was spending a very unpleasant afternoon at the office of his solicitor. By this time Castleravne had almost forgotten

the shortcomings of his sister. He had asserted his authority the night before, and he was pleasantly flattered by the impression he had made. He had not really expected Miss Catlemanne to take him precisely at his word; indeed, he had a vague idea that the whole scene vas the result of some novel he had read years wo and forgotten. He was rather pleased with the clever way in which he had informed his aster that she could no longer consider herself one of his household.

There would be something nice in acting with magnanimity later on. That the victim would ule it au pied de la lettre Castlerayne had not thetted. He was disposed to regard Gertrude's ation as one of his misfortunes—misfortunes which k hoped to meet with great dignity. That his creeks and unkindness had cut like a knife he dd not for one moment realise.

all this was forgotten presently. Mr Summers bei no good news to offer; he took the gloomiest The of the situation. He had seen the solicitors vio acted for Samuel Craggs in the matter of the action, and they were obdurate.

'Between ourselves,' he said, 'they are not a un high class firm. Neither is their practice large one. They will only be too glad to get of the eleven hundred odd pounds you owe

They can't do anything for a few weeks, I Emplose?' Castlerayne asked.

the ves, they can,' Summers said irritably. Arange that I cannot make you see things in their proper light. There was no stay of execution, a re call it; the costs had been taxed, and those explicate in a position to come over to The Tores at any moment. To be perfectly frank with you, they are afraid of your other creditors. If they strike now they may get everything; if ther wait there is a chance of having to share with he rest. If they do go to extreme limits there is 'cir one thing for you to do.'

'And what is that?' Castlerayne asked. The stange shakiness had come over him again, the ane twitching of the muscles. He had been bying against hope, in his infatuated way— the beling that Summers would be able to do some-

thing. 'What do you want me to do? I am sure that anything in reason'-

'Bankruptcy,' Summers said curtly. 'If you go into bankruptcy you will be spared the indignity of seeing the sheriff's officer in possession of The Towers. Then everything will go through the hands of the court. Otherwise, Cragge's lawyers will take possession of your effects, and sell them for what they will fetch. They won't care how things are sacrificed so long as they realise enough to meet their own claims. In fairness to the great body of your creditors, your duty is to take this course.'

The dry professional jargon was sinking like lead into Castlerayne's soul. For the first time he fully realised the desperate nature of his position. Still, with the obstinate weakness of his nature, he argued. Was there no other way? Could not Summers do something in the way of a mortgage-anything to get rid of those fellows? The idea of bankruptcy was horrible, repulsive. Was there not such a thing as a public examination in bankruptcy? Would he not have to stand in open court and reply to insolent questions from irate creditors? All these punctilious questions Summers replied to in a cold affirmative.

'Oh, it is not pleasant,' the old lawyer said grimly. 'Nor is there any great consolation in the knowledge that you have brought it all on yourself. At the same time, it may be quite an honourable bankruptcy. If your family treasures are properly disposed of-the pictures sold at Christie's, and so on-I fully believe that there will be sufficient to pay everybody and leave you a small surplus. The Towers would let for three hundred pounds, and you could live on that. But you are your own master.'

Summers shrugged his shoulders as if declining further responsibility. The papers on his desk swam before Castlerayne's eyes; he was conscious of a queer numbness in his left side. The sensation passed, but left him trembling from head to foot.

'I'll think it over,' he whispered. 'I'll let you know to-morrow. Don't force me to-day. I'm not in a fit state to decide. I'm going as far as the club. I feel that I need something to pull me together. I've never done such a thing before, Summers. I have always despised people who touch spirits, especially in the daytime.

Castlerayne lounged away to the club. He stopped once or twice in the road; he was not quite certain which way to go. He had never had lapses of memory like this before. One or two people spoke to him as they passed, but he did not heed. In the club he sat and wondered why the waiter stared at him in that strange way. He could not see the ghastly gray pallor of his Presently he was sipping brandy and own face. soda-water; the strong and unaccustomed cordial filled him with a glow, a new strength. He felt utterly tired and worn out a moment later. When he came to himself again he saw that it was long past six, and the smoking-room was deserted.

He was home again presently, walking up to the porch. He had not the least idea how he had reached there, though he was absolutely free from the touch of insobriety. There was a lapse of memory, a perfect hiatus, the last hour. He dressed presently and went down to the drawing-room. By this time the queer inertia of brain had gone, and he was his quiet, dignified self again. It seemed impossible to believe that anybody could interfere with him here. He was pleasant and affable to Angela and May, who sat in the drawing-room waiting for the gong to ring. Castlerayne had a vague sense of something missing. Presently he realised what it was: the quiet, placid figure in the gray silk who had occupied the big arm-chair by the fireplace all these years. And Gertrude was the soul of punctuality.

'Why is your aunt so late, girls?' he asked. Angela looked up without reply. As usual, it

was May who explained.

'Aunt Gertrude has gone,' she said. 'Surely you have not forgotten what you said to her last night -so long as she remained a guest under your roof?

'Gone? Gone where? She has no money. Do -do you suppose that I meant it? I was deeply distressed by your aunt's conduct. Indirectly she has brought about the downfall of the House. I am not questioning her motives, her integrity. After my discovery of yesterday I had no alternative but to say what I did. But that she would take me at my word like this! Where has she gone?'

'She has gone to the hospital,' May explained. One of the cottages there was empty. We have been helping her to move all the afternoon. Mr Warrener came and assisted. Aunt seemed very

happy when we left her.'

'And you fell in with this idea-you did not make the slightest attempt to'-

'Indeed we did, father. We had no idea that Aunt Gertrude could be so terribly obstinate. She fairly bore us down by her gentle determination. And she has gone.'

Castlerayne opened his mouth to speak with majestic wrath. But the sonorous words refused to come at his bidding; he could only mumble instead. His eyes were filled with tears. It was strange how his tongue refused to speak. It was only when he controlled himself with great effort that he found words at all.

'A further humiliation,' he said. 'Something for

the servants to talk about. Angela, will you take my arm? We must not forget what we owe to our position. We will discuss the matter more fully presently. Directly I become excited my head is all queer. What a dreadfully poor light the lamps give to-night!'

The two girls exchanged glances. A terrible fear was thrilling at May's heart. She saw how gray and twisted her father's face had become. He was a little more like himself presently; he prattled on commonplaces in a way that jarred on May's nerves. It was only after the servants had gone that the effort faded and left an old, gray man behind.

'Tell us what you did in Hardborough to-day,'

May said.

'What I did in Hardborough to-day?' Castlerayne echoed. 'I have not been in to Hardborough to-day. Oh yes, of course, I went to see Summers. My dear girls, that man grows harder and less sympathetic as he gets older. He would not listen to a word that I had to cay. He had only one cry, and that was bankruptcy.'

'And what would be the result of that?' May

asked. Well, Summers seems to think that everybody would be paid in full. If I sit quietly down, Cragge's solicitors will sell everything at any price so long as they are paid. I find that they are in a position to do this at any moment. Not that we need fear'-

'Stop!' May cried. Her face had grown suddenly pale. 'I implore you not to prevaricate at this moment. Remember what happened in the case of the Montagues. Without the slightest warning strangers entered the house, and they had to go. They had to leave everything behind, even the flowers in the vases in the drawing-room. I saw that after they had left; it was one of the most pathetic sights I have ever seen. Father, is that likely to be our own fate to-morrow-nay, to-night?'

Of course I could prevent it by going into bankruptcy,' Castlerayne said hastily. He had answered May's question despite himself. He could see the girl shudder and shrink. 'That is what Summers advised me to do without delay. In that case everything would be sold in a proper way, and he estimated that the creditors would be paid in full. There might even be a small surplus to come

to us. But everything would have to go.'

Angela glanced round the room at the old cak furniture, the old silver and china, the elmost priceless pictures and portraits on the walls. Her slippered foot pressed into the pile of a Persian carpet with the weight of centuries upon it. The girl loved all these things; she would find it hard to part with them. May's views were not quite the same. She was getting to hate these things The upkeep of an artistic house was calculated to destroy the nerve-centres and take all the temper out of life.

'You must do it,' she said. 'There must be no delay. To be out of debt, to be free to local everybody in the face, to think that we had not deprived a soul of a farthing! Oh! I can only partly imagine the feeling. Father, you will do it?'

Really, I think so, Mr Castlerayne murmured. I fancy so. But a step like that is not to be taken is a hurry. Nothing can be gained by undue lase, which, as the poets say, is half-sister to delay. I am going to give this matter my deep considera-

tion. If you think that I am incapable—— Well, what is it?'

The butler stood in the doorway waiting for his chance to speak.

'A stranger—a—a gentleman to see you, sir,' he said. 'He says that it is absolutely necessary that he should see you at once, sir.'

(To be continued.)

WHERE MUNGO PARK DIED.

SOME IMPRESSIONS OF BUSSA.

By C. LARYMORE, The Residency, Northern Nigeria.

T the close of last year—in England, and more especially in Scotland the life-history and tragic death of Mungo Park were rather specially recalled to the minds of those who, interested in the process of

interested in the progress of African enderation, rightly regard him as one of our finest the direction. The centenary of his was celebrated at Selkirk, close to his birth-Lee Much was written of him; the same meagre ns of information, bare in outline, deficient in call, and sadly lacking in accuracy, were reiterated to commented on; and now it might be supposed the name and fame of the dauntless traveller and sink again into-not insignificance, that could For he-a place of lesser prominence, the quiet izdons of honourable memory and unfading apprecation. But it may not be inopportune for me to the subject even now. Words of an eyerines have always a certain value of their own, are specially in a matter of which so little is thown; and the number of Europeans who har risited Bussa is so insignificant that perhaps few notes which I have been able to gather esmally on the real story of the death of Mungo tr. and a short description of the scene of the tradit, may be not only of some interest, but may in some a useful purpose in correcting existing

In situation of Bussa is well known, on the Ter reaches of the Middle Niger, some two hundred E or more above the confluence of the Niger and Espane at Lokoja, and about eighty miles north debte from which point it is rendered extremely the of access by water owing to the dangerous the and loaming rapids with which the river is the Niger hereabouts is split up into various canels by islands and rocks, true Highland scenery, tran rater rushing and creaming in its fall round b) of thinge boulders; the river fringed on either the by an immensely thick growth of trees and taba making it a matter of great difficulty for the Region to gain any headway against the strong orning to the almost impossibility of finding 7 nd for their long palm-wood poles. They can chy size branches and twigs, and so endeavour to

haul the canoe up-stream, which method is naturally productive of a rich crop of misadventures, such as the sudden crashing down of the rotten branch to which the muscular brown arms are clinging, and the consequent rush down-stream of the canoe until it can be brought again under control by the whole party hanging desperately on to the nearest tree; then the strenuous effort, swirling and rocking, has to be commenced again until the travellers can crawl back to the same point, and beyond perhaps into quieter water, till the next rapid appears, and the same difficulty, and incidentally danger, has to be encountered once more.

The process of ascending this part of the Niger in a native 'dug-out' cance almost reaches absurdity, so puny do the efforts of stalwart, iron-muscled cancemen appear when pitted against the overwhelming resistance of rushing water, jagged rocks, and unseen snags; but the certainty that one mistake—a single moment of hesitation, or so slight an accident as the snapping of a cance-pole—will probably result in the utter destruction of the frail craft and its occupants keeps one's risibility well in check, especially when the water continuously bubbles through a very inadequate mend in the bottom of the cance just under one's feet.

Anything less like the lower reaches of the Niger could hardly be imagined. In the narrow channels -where the trees meet overhead, and the water tumbles, loud-voiced, over rocks and snags-it is hard to recognise it as the same river, and only in the open reaches the crimson and white quisqualis and purple convolvulus remind me that I have met and loved them some three hundred miles nearer the sea. At the worst points, where the chain of rocks appears to bar the whole face of the river, and the confused mass of tumbling water and foam offers no discernible pathway whatever, the canoes are hauled under the steep bank, and their entire contents bundled out thereon, the passengers clambering by the aid of roots and branches to a place of some security, where they can sit on the warm sand and watch the manœuvres below. The majority of the canoemen, divesting themselves of their clothing, take boldly to the stream, where, with the rushing water up to their armpits, struggling against the

current and slipping on the stones, they deftly and manfully drag the absurd little crafts through the rapids by rope-hauling, vigorous pushing, swimming, and attempts at poling. These men are practically amphibious; and it is a fine sight—the active figures swimming and wading, dark, wet skins gleaming, brawny sinews strained to the utmost, white teeth flashing, and the air full of shouts and cries, not to mention the chorus of directions from the bank and pious ejaculations of thanksgiving as each canoe reaches a place of safety. Once they have arrived in more placid waters, the re-embarkation takes place and the journey is resumed.

When, a year ago, we were travelling up to Bussa in this way, we found it impossible to continue the journey by river beyond Leaba; for just above is the Awuru Rapid, the most dangerous and impassable I have seen. Here the natives have driven great tree-trunks vertically into the rocky bed of the stream, and have attached to them a stout rope, by which the unfortunate traveller must drag himself and his canoe through the seething torrent. There is a saddening loss of life, and death by drowning is so frequent that the river-side folks are perfectly indifferent and unmoved by it, as we noticed on that particular day, when a man lost his life trying to negotiate this rapid. The water is also infested by alligators of considerable size. Possibly they come up-river at high-water, and cannot get back until the next wet season. One is told that the body of a man swept from a canoe in the rapids is seldom or never recovered.

I have purposely given the above description at some length with the object of showing that no same man, if he knew, would attempt to descend the river at low-water (during the winter months) in a native canoe from Yelwa downwards. Descending, the danger is increased a thousandfold, owing to the immensely swift current and the probability of being dashed on to the rocks.

Bussa itself is a straggling village, made up of several small hamlets and clusters of grass-thatched huts stretching along the river-bank, and peopled by the simplest of placid, ignorant folks-herdsmen, and cultivators in a small way, but chiefly fishermen. It is in this connection that I am anxious to record my absolute conviction (it is shared by the few other Europeans who have visited the spot and taken pains to investigate the matter) that Mungo Park's death was entirely an accidental one -that is, due to drowning, and in no sense caused by any hostility from the native population. Time deals very gently with these child-like, unlearned souls; their customs, dispositions, and ways of life are undisturbed by any contact with higher civilisation; nothing connects them with the outer world; and, save that one generation has been laid to rest and another has arisen, they are to-day practically the same people who stood breathless on the riverbank and saw Mungo Park hurried to his death a century ago. They are Kanberis for the most part, fishermen by trade, people of a very low order

of civilisation, wearing no clothing save girdles and loin-cloths of leather, further decorating their persons with beads and cowrie-shells-a race somewhat apart owing to their separate language and customs. They do not trade or travel, but pass their tranquil years in catching fish and growing corn for their simple needs, each hamlet testifying to the occupation of its inhabitants by the enormous heaps of oyster-shells piled around. Nothing is farther from their slow thoughts than war and fighting, except in sternest need of self-defence; their sole desire is to be left alone among the corn-husks and oystershells, to spend the crawling years in producing their simple fare, eating it, sleeping, rising again, living, dying, far more undisturbed, far less alert, than any animal, bird, or insect in the 'bush' that lies behind their river-side hamlets.

The headmen speak Hausa, fortunately, so that I could ask my questions and get my information first-hand without the possibility of muddling through faulty interpretation—a source of only too many misunderstandings and fallacies in this country. One of the most remarkable and interesting of these, by the way, is the entirely erroneous connection of Kishra, the famous warrior and chief of Borgu, with Jesus Christ, and the assumption that traces of Christianity exist among the Borgu people. But this is, of course, quite apart from my present subject, and is far too large and involved a question to enter upon without giving it a lengthy paper to itself.

THE STORY OF THE TRAGEDY.

The only published 'facts' are in the account supplied by Amadi Fatoumi, Park's guide, who was, if I remember rightly, the sole survivor of that fatal day. I have here no access to books of reference, and must depend on hastily noted extracts and memory; I would therefore beg for indulgence if I quote at all incorrectly.

How Amadi acquired the impression of native hostility, or what was the origin of the story of 'an army' being despatched to Bussa, I do not venture to say; but there is so much in this account of his that is utterly incorrect and misleading that I feel justified in rejecting the theory of an attack altogether. If there was any prevalent idea of hostility, why did the Sariki-n-Yauri (King of Yelwa), a powerful and influential chief of the large district to the north of Bussa, on the opposite side of the river, provide Park with every assistance, giving him his best men and his largest canoes? And that he did so is a recognised fact and a matter of local history. There was not the slightest need of 'sending an army' to Bussa. If the destruction of the stranger was considered desirable, these people had but to allow him to drift down the river without warning, when he and his companions were, humanly speaking, bound to perish in the rapids.

But this is exactly what they did not do. The matter is by no means forgotten in Bussa to-day;

such stirring events are few and far between there. And—though it is now a case of 'My father saw it; he was but a small boy, but he saw it all'—the story is as clear and circumstantial as if it had happened last week.

The inhabitants of Bussa were horrified to see the approach of the white traveller, who, evidently in ignorance of the danger ahead, was actually intending, apparently, to try to pass the rapids. What would become of Yauri's canoes? What were Yauri's canoemen about? The people rushed n a crowd to the river-bank with the humane intention of doing all they could to prevent the execution of so suicidal an undertaking. Armed? Of course they were armed. The peaceful villagers of the western Soudan have suffered such massacre and ruthless cruelty at the hands of their enemies in time past that, even to-day, to carry weapons is second nature to them. My dearest and most intimate friends of the country come to wish me a 'Merry Christmas' armed to the teeth, and in many parts of Nigeria the most friendly salutation s the shaking aloft of bows, spears, and fists. More than one newly arrived stranger has been considerably disconcerted thereby.

The 'overwhelming crowd of armed natives in cases' is purely imaginary. No one who has sen the rocks at Bussa would consider the idea seniously for a moment. No canoe could live in the stream, and no native would be so crazy at the embark at such a spot. These canoes are stually built in two parts, and laced together longitudinally, so that they can be more easily carried along the banks where the rapids occur.

The facts which appear the most credible are that the Bussa folks, crowding on the banks, gesticulated, shouted, waved arms and weapons in frantic endeavour to check this foolhardy Park and his companions, not unnaturally, interpreted this as a hostile demonstration, and fired on them, it may be; but from this point there is only conjecture to help us. I cannot ascertain whether the tragic finish was the dashing of the canoe on the rocks, or whether the white men actually jumped into the water, choosing rather to drown than be the victims of the attack they imagined to be in progress. The whole sad affair could only have been a matter of minutes, possibly only seconds, before four lives were sacrificed to a misapprehension, as, alas! so many others have been sacrificed in the same way in Africa.

Further details of Mungo Park's death I do not suppose we shall ever have. Personally, I think the evidence is most strongly in favour of its having been an accidental one; and it is to me a great satisfaction to be able to hold this view rather than to believe him the victim of a cowardly and unprovoked assault.

It is true that no monument marks his grave; but surely none is needed. Mungo Park is not forgotten; and of all the tiny stream of Englishmen who find their way to Bussa, each, seeing those cruel black rocks, must feel his heart beat high with pride to claim citizenship with the man who died there. No gorgeous marble tomb could be half so sacred or so significant in the eyes of his fellow-countrymen.

A MILANESE MYSTERY.

CHAPTER III.

OUGLAS passed the rest of the day in a state of increasing restlessness and conviction: the former because he did not know what to do to substantiate his belief that Bassano

the cobbler had very much to do that the tragedies which were still an unelucidated martel to Milan, and the latter inevitably the more he sought other interpretations of the conduct and works of the cobbler and his daughter.

At one time he was for calling upon the Cavalere di Barese and telling him all he knew and samised. But scruples withheld him. It was try repugnant to him to think that he might be a recter of Bassano's home. He could not do it, indeed, How, for instance, would that poor, pretty girl look at him, forsooth! Why, she would perhaps set to tear the eyes from his head. Moreover, a crain feeling of pride supported his natural indication in the matter. He had undertaken this carge alone. If the worst befell, and Bassano

were really a dastard of the kind indicated by the press, whom to lay by the heels were the manifest duty of the first righteous man who discovered the cobbler's infamy, then he would share his triumph with no one.

He hoped, and quarrelled with his hopes,

In this confusion of mind he wandered about the city. He spent a silent hour in the beautiful Duomo, apparently lost in pious meditation, but most of the time thinking of those three or four souls whose fate might chance to depend upon him: Bassano and his daughter, the worthy Marco, and that abbreviated human devil of a Bolla, with the cars which declared him more brute-beast than man. There was besides the Count, for whom he felt a dislike as great as that inspired by the dwarf. He also could not be disassociated from any exposure of the casa Bassano.

But throughout the reflection there was all the time this one baffling and quite important detail. Though he had it in plain black and white before him that Bassano and Bolla were Mafa

fiends, he could see no key to the manner of their operations. Of all men, Bassano, the shrinking pink-eyed piece of timidity! How could he be made responsible for such magnificent chemistry? There was no trace in him of audacity, whether of mind or body. And from what Maria had told him, her father was little better than an anchorite, shut up all day and all night with his leather and his tools, save when as a rare enterprise he stole out for a glass of vermouth at the 'Nazione.' Maria had said it was but once a week or so that he thus dissipated, and then he was back again in a few minutes. No; there was nothing villainous or masterful in the composition of Bassano the cobbler, so far as the common eye could see.

It was late when Douglas returned to the Via Corta. He felt a little anxious about his reception. In his hand, moreover, was another evening paper with comments on the Gaszetta's article about the five mysteries. But he would keep that to himself, go to bed, and perhaps awake with some wise ideas.

To his satisfaction, however, Maria Bassano opened the door to him with welcoming eyes.

'It contents me to see you, caro signore,' she said with gentle friendliness. 'I was not myself this afternoon. I fear I behaved with some asperity. The signore will, I hope, not remember it.' She proffered her hand in the dimly lighted passage.

'I have quite forgotten it, little one,' said Douglas cordially. 'I sympathised. You believe that?'

He could hear the tap-tapping of the cobbler's hammer upstairs. Bassano did not often work so late, though the sound was always the first that came to him when he opened his eyes in the morning.

'Yes, replied the girl. 'I believe everything that is good of the signors. But there is something I wish to say. It is about Masuccio,'

'What about the fellow?' asked Douglas.

'I have arranged it with myself, signorino. It was a foolishness from the first, that intimacy. I perceive it now. One has one's looks, to be sure, and it seems a pity not to make a little money innocently with one's face as well as with one's hands, if God gives one the precious gift of beauty; but, yes, I reproach myself for Marco's sake. I have done with him. When he returns to-morrow I shall give him his boot and tell him the truth. He may take his boots to another cobbler in future, and if he requires it of me his presents shall all be returned to him. Ah! but it will be a sorrow, signorino, to surrender them. Especially the car-rings of gold and crystal, and the bracelet with the corals! But I tire your amiability, caro signorino. Here is the lamp, and good-night.

Douglas was not eager for the lamp.

'This is fine news, little one,' he said. 'I congratulate you.'

'The signore is very kind to say so,' continued the girl. 'But there may be trouble, nevertheless.

The Count is of a haughty nature. One must trust in God even more than one's self. There is one other thing to say; but I do not like to perhaps vex you, caro signorino, by saying it to-night after my wicked passion of '——

'Never mind that, Maria,' Douglas interrupted, scenting a reference to Bolla. 'Whatever it is, tell

it to me now.'

'Truly?' She put the question with arched eyebrows and a very sweet gravity in her blue eyes.

'Yes, I request it,' he said.

She gave him his candle first.

'It hurts to say it, caro signorino; but I have persuaded my father to leave Milan very soon; perhaps to-morrow, perhaps the day after. Will it incommode you very much to seek another apartment in the morning?'

'You leave Milan?' he asked, astonished.

'Perhaps, signorino. There are reasons. I must not name them.'

Douglas's presence of mind failed him for the time, thus confronted by the likelihood of fresh disappointments.

'Those tiresome reasons again!' he exclaimed.
'Any one would think your father was—was not'—— In some confusion, he stayed his tongue.
'We will consider it in the morning. There will be time then. Good-night.'

He turned for the stairs. The girl's eyes had enlarged with his words, and it would not have surprised him to hear another outburst from her. But none came. Perhaps it had lacked time to develop.

Alone in his little room, with the saints on the walls and Maria Bassano's patchwork bedcover, made in the days of her sublimely innocent early teens, Douglas put the candle on the toilet-table and gave way to his irritation. The tap-tap of the cobbler upstairs still continued. It seemed to add to his annoyance. He was a fool to have let his personal feelings for one moment interfere with his prescribed duty as a pursuer of He ought to have consulted the evil-doers. Cavaliere di Barese that evening. Were it not so late, even now he would, perhaps, have gone to him. What a fool to have allowed a pair of Venetian blue eyes to waste his time, and, again perhaps, involve the downfall of another life! This projected flight of the Bassano establishment confirmed all the portents. The Via Corta was at the root of the five horrible assassinations, and Bassano the cobbler at the very root of the root.

He went to bed with every determination to rise early and make amends for his negligence; and it was with the tap-tapping of the cobbler still sounding in the house like a death-tick that sleep very considerately came to him.

But, in fact, he did not wake early. That is to say, it was eight o'clock before he opened his eyes and turned towards the sunlit corner of the Castello and the patch of the Piazza d'Armi beyond his unblinded window.

He lay still for a few moments, gathering the threads of his life.

There was talking somewhere on the premises below. Outside, a fruit-seller was proclaiming fresh spricots and other things.

Then Douglas jumped from his bed. The importuse of the day thus begun had loomed large to his imagination. It behoved him to waste no more time. He could hear that persistent cobbler at work upstairs; not hammering, but moving weights, Bil were. Most of all, however, he heard the voices downstairs. And it was with only one leg in his pasers that he suddenly realised whose voice it as well as Maria's. Maria's had risen to a is sonate and rather shrill pitch. The other's had is risen from a basso profondo to something like and the other's was the Count Enzio

At such an hour !

Still with the right leg in and the left leg outble his trousers, Douglas quietly opened his door. li relied on a latch only and a key which he never

'It is your last chance, carina,' he now heard the Cantagy. 'I shall bring a carriage to this end of the Via Legnano at ten o'clock. If you do not come to me I come for you. Ponder it well.'

'No, signore,' said Maria Bassano. 'I have told Ist it cannot be.'

And I repeat that it is either that or there will k conething that will make you sorry. I am not meter of myself, my dove.

Have the courtesy to depart, signore, then said Lia lowering her voice. 'My father, I think, is

Ver well, agnorina,' said the Count in a much the ordinary tone. 'It is understood. Addio!' Douglas heard the house door close, and shutting own door, proceeded with his toilet. He stepped the window. The Count lived at the cemetery c of the city, and would probably, as usual, pass trans the plazza. There he was, indeed, with the parcel under his arm, a gray felt Tyrolese to this head; for the rest, perfectly gloved, and the aslender umbrella. It had rained in the night, there were puddles on the road. The Count the careful to avoid the puddles.

For maybe a full minute Douglas kept the Caleman in sight, until he was near by the trees the here bordered the great piazza.

Duglas was buttoning his braces and about to that are, when suddenly he seemed to freeze from tal to foot Could he believe his eyes? The themale Masaccio had disappeared, and instead in there was a little cloud of particles whichthe course he could believe his eyes. The report to a common which sounded a moment later told

Starter borror-stricken, he saw the cloud die try. There was no well-dressed Count Enzio Musuccio visible where the cloud had been; but a gendarme and a man in an operative's blue smock were running towards the site of the explosion.

Douglas slipped into his coat without troubling about anything else.

The silence of the house was almost a stunning contrast to that fatal roar whose echo was still in his ears. Not a sound now came from the cobbler upstairs. But when he opened his door he heard a whisper from below, and a subdued patter of prayers from Maria Bassano drifted towards him. Holy Virgin, intercede for us in this our hour of greatest need!' While he paused, irresolute, Douglas heard this much of the piteous little petition fly off to heaven.

A shout from the cobbler broke upon the girl's prayers like something sacrilegious. 'My daughter!' yelled the man.

Maria Bassano sprang up the stairs. 'Oh, signore!' she gasped as she fled past Douglas.

A minute later she rushed down.

In the meantime Douglas had waited and resumed his dressing. There was a crowd on the piazza now-men, women, and boys looking about them as if they were hunting for many lost pieces of money. At times one would stoop, pick up something, and drop it again. Upstairs the cobbler and his daughter conversed strenuously.

And then the girl descended, and Douglas intercepted her.

'Well?' he said. 'The Count—you know, per-haps—he has been exterminated. He, the sixth!'

Maria Bassano clasped her hands on her bosom. The agony in her eyes was dreadful to Douglas. Yet she spoke calmly in assent.

'Si, signore, the sixth! But it was a mistake. It does not matter. We are, of course, ruined this time. But it was not Masuccio who was decreed to die. Dio mio! no. My father, in his agitation, placed it in the wrong boot-that of Masuccio. He has discovered that it was so.

Looking up, Douglas saw the pallid face of Bassano himself at the top of the stairs. But in spite of his pallor there was an expression of vigour in the cobbler's eyes which was new to Douglas. He had the air, indeed, of a man whose back was against a wall, and who meant to fight.

Thus standing, the cobbler spoke.

'Are you a friend to us, signorino?' he asked steadily.

'That is it, caro signorino,' whispered the girl, still with her fingers locked on her bosom. 'You will not betray us, you who are so amiable and good? There is a train for Parma in an hour.

Douglas glanced from father to daughter, and from daughter to father. Then he turned to the window. It was their simplicity that had first impressed him. As if he could intervene between them and their fate in such a moment! But now, on further knowledge, he perceived that there was at present no evidence to connect this disintegrated

Count Enzio with the house he had left five minutes ago. The crowd had swelled. There were several police, who seemed quite at a loss whether to look up to heaven or down upon the ground for information about the identity of the luckless sixth in this chain of calamities. That a sixth citizen of Milan, or otherwise, had been blown to uttermost fragments was no doubt clear to them; but how

could they ascertain more than that? 'Tell me,' said Douglas to the cobbler, who had come downstairs, 'you are an instrument in the hands of others? Is it not so?'

'A most unhappy and unwilling instrument, signorino,' replied Bassano, tremulously as of old, with shaking hands. 'Before God, I swear it.'

'And did not mean to murder that man?'

'His Excellency the Count, signore? No, by the bones of San Carlo! I confused them. I will confess to you, Signore Inglese, as to God Almighty. The man whom I must not name brought the thing which I must not talk about, and a certain boot. I was to put it in the heel of the boot. Undoubtedly there was a resemblance between the two boots, and being so fatigued last night, I-But your goodness understands without more words.

'An infernal machine in the heel of a boot?' said Douglas, almost incredulous.

'Si, signorino,' replied the cobbler. 'An invention of the devil! I know nothing about it, God be praised! I do but obey the commands which are forced upon me.'

'But how'-Douglas lost sight of all else for the time save the ingenuity and energy of such murders-'how came he to put it on here-the boot?'

'That was an accident, caro signorino,' said Maria. 'It was his right foot, and he complained greatly of the tightness of the boot he was wearing. He changed it for the-the mended one, although it was not a perfect pair with the other one, and'-

She covered her face with her hands.

'There is little time,' protested the cobbler, with urgent eyes between their pink lids. 'May we trust you, signorino?'

'Yes, you may trust me; but there is one thing These misadventures—are they managed by clockwork?'

The cobbler hesitated, sighed, and looked earnestly at his daughter.

'The signore is very inquisitive,' he remarked. 'Shall I tell him this also?'

'He is our friend, father. He has said we may trust him. The English do not lie, replied Maria

That is so. I repeat it. I am your friend to the best of my powers, said Douglas. 'But I am, as you say, inquisitive. Are they little boxes of witchcraft set to a time?'

'No, signore,' replied the cobbler reluctantly. 'There is a head to them which the heel presses. But they do not all go off immediately. The pres-

sure has to be sufficient. Is that all the signore wishes to know?'

And then Douglas realised the cruelty of his questioning at such a crisis. 'It is all,' he said. 'Make haste with your pre-

parations, and good luck to you both. I also will pack my little bag.'

Maria Bassano began to call down Heaven's blessings upon him; but he urged her not to take that trouble.

There was still no indication outside that any one had knowledge of the deceased Count's movements before the disaster. The crowd had swelled, and included mounted officers of the king's army. The roar of voices in exclamation could be heard through the window.

A certain anxiety now seized Douglas. Supposing this general exodus from the house were noticed, might not dangerous inferences be drawn?

Of course it was so. He decided at once to take with him only such things as he could conveniently carry about his person; and thus lightly padded he left the room to say 'Good-bye' to the Bassanos.

'May I come up?' he called, and taking straightway to the stairs, he was soon in the cobbler's workshop.

'I am going. Once more, "Good-luck," he said. He gazed about him as he held out his hand to the pink-eyed accessory in such vile deeds. But there was nothing remarkable in the attic. A bed was in the corner, and the commonplace litter of a cobbler's workshop was all about. He observed, however, a package which evidently contained a boot.

The cobbler wiped his hand on his apron ere, with profound respect obvious in his pink rimmed

eyes, he responded to Douglas's courtesy. 'You are a noble benefactor to us, signorino,' he

'By no means,' said Douglas. 'Don't be rash in your movements, that's all. Let your daughter stammered. walk to the station by herself, and you after her. And don't overload yourself with things, He fingered the parcel idly while he spoke, then lifted it with an inquiring smile. 'Perhaps this also?' he whispered.

'That, caro signore,' said the cobbler huskily, 'is the other one. He, the agent, was to come for it at noon. But his visit will be useless.'

'Bolla?'

'Si, signore.'

'Happy man, then, this other, eh-at least for a time? Well, addio, in conclusion.'

Downstairs he had but few words for Maria, whose tearful blue eyes and quivering lips disconcerted him. He merely repeated the precaution which he had mentioned to her father, wished her every happiness amid more enlightened surroundings, and left the house.

A stream of people was in the Via Corta, making for the piazza; and on the spur of the moment Douglas went with the tide.

He stayed for a few minutes on the outakirts of the crowd, quietly looking about and listening to its comments and ejaculations. The police were busy forming an enclosure, as exact as they could gress at it, round the spot of ground which held conjecturable morsels of the unfortunate Masuccio. But this were a difficult matter if a certain gossip of the crowd spoke truth in saying that he had sen no fragments of anything larger than a coatbutton.

Back at his hotel in the Corso Vittorio Emanuele, Donglas spent a quiet, thoughtful day and the subsequent night. And the next morning he left for London without paying a second visit to the Caraliere di Barese. It distressed him a little to act with such apparent incivility, but he feared to face that experienced gentleman. He could not hope to escape easily from such questions as the Cavaliere would be bound to ask; and it were better that the Cavaliere should wonder at his discourtesy than that he should by an involuntary word or look give him cause to suspect the Bassanos. Others might now take up the investigation of the Via Corta's connection with the mysteries. They undoubtedly would do so at once, and Douglas could only hope that the cobbler and his daughter might successfully obliterate themselves in Parma or elsewhere.

His own short week in Milan was at any rate one to remember.

THE END.

THE BLACK CHANTER OF THE CLAN CHATTAN.

By the late ALEX. MACPHERSON, F.S.A.Scot., Author of Gleanings from the Cluny Charter Chest, &c.

MONG the many interesting historical relics carefully treasured at Cluny Castle, Inverness-shire, the seat of the chief of the clan Chattan, is the Black Chanter, or Feadan Dubh, of

the clan, on the possession of which prosperity of the House of Cluny is popularly supposed to depend.

of the many singular traditions regarding it, one is that its original fell from heaven during the memorable clan battle—rendered familiar to general raders through the pages of Scott's Fair Maid of Park—fought between the MacPhersons and the lavidsons, in presence of King Robert III., his twen, and nobles, on the North Inch of Perth, in 13%, and that, being made of crystal, it was boken by the fall, and the existing one made in facsimile.

Towards the end of the combat, we are told that there was seen an aerial minstrel hovering over the bads of the MacPhersons, and that, after playing a er wild strains on the instrument, he let it drop hom his hand. The MacPherson piper secured this tachanted pipe, and, even though mortally wounded, poured forth the pibroch of his clan till death effectually silenced his music. The Black Chanter was ever after endowed with magical properties, and in the opinion of the clan MacPherson, Sir Waiter Scott was even more lamentably in error in thributing their victory on this occasion to the etraordinary valour of one Smith* (whom they ad to enrol hastily to make their numbers equal to those of the Davidsons) than he was when, in common with Stevenson and later-day writers, he nade pure-speaking Celts talk the broadest of Scotch dialecta.

Another tradition is to the effect that this is the genuine, original Black Chanter, and that the cracks seen on it were occasioned by its violent contact with the ground; but be its origin what it may, it is a notable fact in the Highlands that, whether in consequence of its possession or of their own bravery, no battle at which the MacPhersons were present with the Bratach Uaine (green banner) of the clan and the chief at their head was ever lost.

It is related that before the battle of Culloden an old witch or second seer told the Duke of Cumberland that if he waited until the famous green banner and the Black Chanter came up he would be defeated. As a matter of fact, Ewen of Cluny with six hundred of his clan had been present at the battle of Prestonpans, and had accompanied 'Bonnie Prince Charlie' into England. On the latter's retreat to Scotland, Cluny with his men put two regiments of Cumberland's Dragoons to flight at Clifton, fought afterwards at Falkirk, and was on his way from Badenoch to Inverness to join the Prince when flying fugitives from Culloden met him with the news of that day's sad disaster.

The celebrity of the Highland bagpipes and the part they have played, so to speak, in the history of the Scottish regiments are well known-'as others with the sound of trumpets, so those with the sound of the pipes are inspired.' The potency of bagpipe music on the hearts of all true Highlanders is universally acknowledged, and to those whose dearest associations are connected with the heatherclad mountains and rushing torrents of the Highlands there is something singularly heart-stirring in the Failte (welcome) on the strains of the bagpipe, and something inexpressibly touching in the plaintive notes of the Cumhadh (lament), especially when heard in after-years, perhaps in the exile of a distant land. With the echoes of the enthralling tones of the Black Chanter in their hearts, can we

^{&#}x27;it is interesting to note that the Smiths in Scotland dan to be one of the principal branches of the clan Castan

wonder, then, that it was dearly prized by the MacPhersons, and not alone for the prosperity it

ensured to them?

The Feadan Dubh also brought good fortune to its temporary possessors whenever lent to other clans by the generosity of the chief of the time. The Grants of Strathspey, having received an affront through the cowardice of some unworthy member of that clan, and being dejected beyond measure, borrowed the magical instrument. Its bold warnotes soon roused their drooping energies, and stimulated them to such valour that from that time forth it passed into a proverb that 'no one ever saw the back of a Grant.'

It was afterwards borrowed in the same way by the Grants of Glenmoriston, and it was restored to the chief of clan Chattan only in the early part of last century. The superstitious point out triumphantly that it was while the Feadan Dubh was out of the MacPhersons' possession, during the latter part of the eighteenth century, that their beloved chief, 'Cluny of the '45,' suffered such terrible hardships for his devotion to the cause of the hapless Stewarts, dying an exile in France, far away from his beautiful mountain glens, whose frownings crags had so often re-echoed the piercing notes of the Black Chanter calling the brave clan Chattan to battle.

THE UNDERCURRENT.

By J. J. BELL.

I.

HE second-mate of the *Thorgrim* had a grievance, and he was a born nurse of grievances who had nourished many in his time. He gave most of his attention to the present grievance as the whaler neared the

mouth of Isafjord, on her way from the healstation to the outskirts of the Greenland ice, where the rorquals were then being hunted. Apparently he was devoting his whole attention to his duties as steersman. He kept his gaze immovably ahead, yet it is probable that he saw nothing—neither the great brown, bluff headland guarding the entrance to the fjord on the left, nor the range of mountains on the right, their ragged ridges white with eternal snows, nor even the dark water of the wide channel and the gray sky above it.

So absorbed, indeed, was he that he started violently when old Kaptan Svendsen, who was sitting behind him in a corner of the steering-box, stretched out his hand and pulled the cord com-

municating with the fog-horn.

A whaler had appeared round the brown headland, and Kaptan Svendsen, who for the past halfhour had been meditatively regarding the olivegreen horizon ahead, desired some information of her skipper. The approaching whaler blew a white cloud and piped a reply. She was bound for the Langore station, not far off, and she was towing a blaa-hval as long as herself, and swollen above the surface of the sea like the half of an oval balloon.

'I would speak with Kaptan Clausen,' said Svendsen, and the second-mate altered the Thor-

grim's course accordingly.

Ere the two whalers were abreast of each other Svendsen bawled his congratulations. Such a grand blue-whale had not been taken that season by any of the neighbouring companies. Clausen shouted his thanks, adding that the capture had been made

easily and speedily. 'Sixty fathoms he ran out, and then he died.'

'Bad weather, I see,' said the old man, nodding his head seaward.

'Left a gale behind us, kaptan,' replied the other. 'No use going out to-day.'

'I feared it.' Svendsen waved his hand, and the whalers parted.

He turned to the steersman.

'Adelvik,' he said shortly.

Something like animation dawned on the sullen face, something like eagerness awoke in the dull eyes, of Einar Ovesen, second-mate. But it was not a youthful animation, nor was it a pleasant eagerness to see on the countenance of a man of little over thirty.

'Adelvik, kaptan,' he repeated, and turned the bow of the *Thorgrim* in an easterly direction.

Adelvik is a little bay not far from the mouth of Isafjord. It is safe shelter from many winds and a good anchorage. There go whalers when the weather discourages a seaward trip and when a return to the station would merely mean waste of time and coal; there they lie until their impatient captains decide to risk the run to the ice, and give the orders that send them wallowing and staggering across the Arctic Circle.

A couple of hours after the meeting with the Langore steamer, the *Thorgrim*, with wet decks and a salted funnel, slid smoothly into the bay and

presently came to anchor.

Adelvik is bounded east and west by great walls of rock, bare and precipitous, and landward by a strip of stony shore. Beyond the shore the ascent is rapid towards the frowning mountains, which, however, are deeply cleft by a narrow glen—the most vividly green patch, perhaps, on the north coast of Iceland. A few huts, the wooden upper storeys more or less gaily painted, are visible from the water.

By the time the Thorgrim rode safely at anchor it was noon; and on board the Thorgrim noon meant dinner. Einar Ovesen was reminded of that fact by Hansen the cook going aft with a large resel of sweet soup, from which escaped the fragrance of fruit stewed in sugar. Einar was engaged in watching a Danish schooner anchored some fifty fathoms to starboard. He watched espectantly, and smiled when a man appeared at the schooner's rail, waved his hands, held up eight fingers, and pointed shorewards. Einar returned the signals and betook himself to the cabin. Perhaps be was not aware that he was licking his lips.

Kaptan Svendsen and his first-mate, Sigurd, were already enjoying the soup, consisting of raisins, prunes, currants, and small slices of dried apple in symp. The fact that they ate sweet soup three days a week had apparently no effect on their appetites. They glanced towards Einar and nodded pleasantly enough as he took his seat. Einar sowled and helped himself to a small supply of

'We shall get out to-morrow,' observed Kaptan Stendsen cheerfully. 'It is too early for a long gale.'

Kaptan Svendzen was a hopeful man and hard to depress.

'There is no doubt about that,' said Sigurd with a kindly laugh. He picked the stem of a current from his strong white teeth. 'Did you hear, kaptan, that the Hokla came in yesterday with seven whales

'Solved Sigurd!' the old man returned contemptuously. 'Not sixty barrels in the lot!'

But they say that the time is coming when there will be none but sej-hoal to kill from

'it will not be in my time, my good Sigurd. It have heard that the blaa-hval and the fin-hval mi, maybe, the knol-heal are moving south. It may be so It may be that they are becoming afraid. ldo not know. They went north for fear of us, I believe. It is not so long since I killed whales bot two miles from Isafjord, Sigurd; and now we p sity, eighty, a hundred miles, and farther, to had them. But if they go south they will be

llansen entered with a steaming dish of lobscouseall meat and potatoes boiled and mashed together. He laid it on the table, but did not remove the soup, to which captain and mate were wont to return after the meat-course.

Einar, you do not eat,' remarked the old man. You should have hunger after two mouths at the

'I cat as I wish,' retorted Einar sulkily.

'So'' said Kaptan Svendsen quietly, and resumed his conversation with Sigurd.

When the meal was over, Sigurd set his pipe ging, took a fishing-line from his locker, and went on deck. It was customary to fish while stormbound in Adelvik; already the majority of the crew were busy, and numerous haddock and cod, the firmest, whitest, and sweetest in the world, were lying on the deck.

Sigurd with his knife scraped the flat leaden sinker, to which were rigidly attached the two stout hooks, until it shone brilliantly. He took his stand by the rail, and let his line run to the bottom. Raising it three or four feet, he gripped it firmly and began jerking it over the rail towards him and letting it slip back. At the fourth jerk it quivered violently, and he drew on board a fine two-pounder. From which it is evident that the simplicity of the method of line-fishing in Icelandic waters can only be equalled by the simplicity of the fish there.

Hour after hour the sport-or, rather, the business-went on, the men mechanically sawing the air, water, and rail with their lines, and bringing fish, hooked by head, body, or tail, on board at frequent intervals. At four o'clock Sigurd descended to the cabin for coffee.

The old man was sitting at the table with cards in his hands and before him, engrossed in his solitary game of 'patience.' Opposite to him lounged Einar, sullen as ever, staring idly at the skylight, and occasionally sipping eau sucrée from a thick tumbler. The coffee was partaken of in silence, and when he had emptied his mug the first-mate went again on deck.

Five minutes after he had gone the second-mate spoke.

'Kaptan !'

'Well, what is it, Einar ?'asked Kaptan Svendsen, a trifle irritably. The old man did not like to be disturbed at his favourite pastime.

'I ask leave to go on shore this evening,' said Einar, with a furtive glance across the table.

Svendsen laid down a couple of cards and stared at them thoughtfully. Several times during the present season the Thorgrim had been forced to anchor in Adelvik. On each occasion Einar had received permission to go ashore. On each occasion he had returned-after the time stipulated-in a condition which, if it were not that of actual drunkenness, very closely approached the same. The old man had been quite at a loss to understand how the young one had contrived to arrive at that condition. Drink was forbidden on the Thorgrim, and it was scarcely likely that it could be procured at any of the few huts on the shore, the inhabitants of which did not taste alcoholic liquids twice in the year, and rarely possessed any store of their own. Svendsen thought of the Danish trader, but remembered that she had not been in Adelvik since the beginning of the season. Other whalers that had been in the bay along with the Thorgrim occurred to him, but he dismissed the suggestion almost at once. And Einar had sworn, when he was given the berth of secondmate, that he would bring no liquor on board at any time. The old man was sorely puzzled, but he made up his mind as to his duty.

He laid down a third card, and, regarding it

attentively, said quietly, 'I cannot give you leave, Einar.'

Einar changed his position. 'You will not be sailing before to-morrow, kaptan,' he said, still staring at the skylight. 'There is nothing for me to do on board.'

The old man set a card straight. 'I cannot give you leave, Einar. Have you written to your father lately? There is a mail from Isafjord a week hence, and we shall have returned by then.'

'Then you refuse me leave, kaptan?'

'I have said it.'

Suddenly Kaptan Svendsen, as if with an effort, raised his shaggy, grizzled head and fixed his keen

gray eyes on the young man's face.

'Listen, Einar Ovesen,' he said gently. 'Your father, my oldest and dearest friend, gave you into my charge. Your father loves you, though you have not been a good son to him in the pastin the past, Einar-mark that! I speak only of the past. I am not reproaching you now. You have always been clever. You can do well, if you like; you can please your father and make him proud. It is not for me to tell you how. You know it. I gave you a chance because your father asked me. I would not have done it for your sake then; but I am waiting, Einar, to be able to do something for your sake. You have but to give me opportunity.'

Einar shifted his position impatiently. Had the old man turned Lutheran priest?

'Have I not done my work?' he muttered.

'I have not complained. I have sometimes wanted you to take more interest in things, for it is the interest that makes work happy; but I do not complain. And if you do not care for the whaling when the end of the season comes, I will help your father to get you another berth. Mean-

time, I am your kaptan, Einar.' The old man bent over his cards, but his pleasure

had departed.

Without replying, Einar rose and quitted the cabin.

Kaptan Svendsen sighed.

Supper was taken at seven o'clock, and thereafter the old man turned in for a four hours' spell. He had seen a satisfactory change coming over the weather, and he hoped to get the Thorgrim to business in the early morning.

About midnight he went on deck.

'Sigurd,' he said to the mate, 'we will start at four. Do you turn in now; but first send Einar to me.'

'Einar, kaptan? Einar is on shore. He left the ship at eight o'clock. Have you forgotten,

kaptan ?'

'So!' said the old man, looking away. 'Ja, I have forgotten. I—I slept heavily. Get out the other boat, Sigurd. I will go ashore for him; he must not delay our start. I will take Hans with me. Tell him.'

Or maybe a blast of the Let me go, kaptan. siren will be enough.'

'You will take charge till I return,' said Kaptan Svendsen quietly but finally.

And Sigurd, who knew the old man, hastened to fulfil his orders.

'You understand, Sigurd,' said Kaptan Svendsen when the boat was ready-'you understand that the young man was given into my charge by his Therefore I must try to see that he comes to no harm. Did he take his gun with him?'

'I did not notice, kaptan. But when he went ashore another boat went ashore from the trader. I think Einar has a friend on the trader.'

'So!' muttered Svendsen, and dropped easily from the low deck of the Thorgrim into the boat.

On reaching the beach, where the Thorgrin's other boat already lay, the old man bade Hans remain where he was and stepped ashore.

The northern horizon was aglow with the rising sun, which had set less than an hour before in almost

the same position.

In front of the nearest hut an Icelander was shaving the lumpy grass with a tiny scythe. There would be plenty of time for sleep in the long winter, and in eld Isafold it is well to make hay while the sun shines. As Svendsen approached him the Icelander paused in his work and took snuff from a horn flask. They raised their caps to each

Yes; the Icelander had seen two men come ashore in two boats some hours before sunset. They had met on the beach and had gone up the green glen; he could not say how far, but it could not have been a great distance, for erelong one had returned to his boat and rowed to his ship-the Danish

Kaptan Svendsen thanked the man, and went off trader. in the direction indicated.

On a grassy space, hidden from the rough track by great boulders, Einar Ovesen lay asleep. His heavy breathing in the dead stillness of nature had reached the old man's ears, otherwise he might have remained concealed for ever. Little gray moths played over and around him.

'So!' whispered Kaptan Svendsen, and the note

of the whisper was very bitter.

An empty bottle lay on the grass near the sleeper; two bottles, unopened, lay in a cavity under a rock close by, and a flat stone like a lid was beside them. This, then, was Einar's secret store at Adelvik, supplied, doubtless for a consideration, by his friend the Dane.

Brandy of the vilest quality, containing little but a spirit of madness. Svendsen knew the gaudy labels on the bottles. Once in the old days he had seen the beach at the station littered with empty bottles so labelled; and now he saw again the awful night when the sixty factory hands had gone stark, raving mad, and when he, with the manager and the few sober individuals left, had gone forth with guns too late to save a poor wretch from being slit up by a brute with a flensing-knife. He turned and shook his fist at the trader lying in the bay, though doubtless her owner and her skipper were innocent of assisting Einar to his present sorry condition.

Then he stepped to the cavity, picked up the bottles, and smashed them on the rocks.

Einar awoke. First surprise and wonder in his amy eyes, then a very devil.

'You swine!' cried Svendsen. 'If it were not for your father I would leave you here to rot. Get up and come with me.'

'Spy!' muttered Einar, rising slowly. Somehow the neck of the empty bottle had got into his hand. The old man was unarmed.

'Throw that bottle against the rock,' said Svendsen calmly.

Einar hesitated, then obeyed.

'Come!'

Einar lurched forward, pulled himself together, unl walked fairly steadily towards the shore a few paces in front of the captain.

They came to a streamlet.

'Bathe your face,' said Svendsen. 'So!' he murmund when the young man rose from his knees.

As they drew near the boat the old man said barriedly, Einar Ovesen, this matter is between on and me. For your father's sake I will not betray you. I will shield you. I will give you one more chance. When we get on board you will tarn in at once. You understand.'

Stepping into the boat after the young man, hapian Svendsen remarked to Hans, 'Einar had an exident among the rocks. I found him unconscious. Give me an oar.'

And so they went back to the Thorgrim.

Sgurd was the only one on deck. Before the to reached the steamer's side Svendsen called to him, Sigurd, go and see if Hansen has left any coffee in the galley. If not, make me a cup, like a good

'Right, kaptan.'

They clambered on to the deserted deck.

Go to my bunk quickly, whispered the old man b Einar. The captain had a tiny stateroom. 'I bring you coffee. But go quickly.

The half-dazed man obeyed, and the other gave a little sigh of relief.

Signed appeared with a steaming mug.

Tak' said Svendsen. 'Call the men to get up tachor, Sigurd. I will return soon. It is Einar's ratch, but Einar had an accident among the rocks, ad I found him unconscious. He repeated the words rather too carefully.

Ja, kaptan, said the mate, rather too carelessly. Svendsen looked at him keenly. You know, Signed ?

'I know, kaptan.'

A moment's pause. Then, 'I am your kaptan,

'Always, kaptan.'

So they understood each other.

It was the evening of the next day, and the Thorgrim had been fast to a fair-sized 'blue' for upwards of four hours. The harpoon had been well enough placed, but its bomb-point had somehow failed to explode.

The gun had been reloaded, and Kaptan Svendsen was now standing by it, waiting for an opportunity to fire a second harpoon and so put an end to the struggle. The steam winch was grinding away, the cable was coming slowly on board, and the Thorgrim was gradually coming up with the whale, which had been swimming at or near the surface for some time, towing the steamer after him.

Suddenly, at an order from the captain to the steersman, who sang part of it down the tube to the engineer, the Thorgrim spurted ahead and ran parallel with the 'blue,' and four or five fathoms from him.

Kaptan Svendsen slewed the cannon to the left, took a brief aim, and pulled the trigger-but without the expected result.

With a roar of wrath he swung the weapon from him.

'Sigurd!'

'Kaptan?' came the mate's voice from the steering-box.

'Half-speed! The gun is broken. It will not fire. Come you here.'

Leaving Einar in charge of the wheel, Sigurd hurried forward to the bow platform. Along with the captain he examined the gun carefully. Presently he shook his head.

'I think it is the trigger, kaptan. We can do nothing with it till we get to the station.'

Svendsen pointed in the direction of the whale, which was once more swimming ahead of the Thorgrim.

'He will not die,' he said irritably. 'He might live so for days.'

'But he becomes exhausted, kaptan.'

'Ay; and then he finds his strength again. But I will not give him up; I will not let him go. I will lance him, Sigurd. Where are the long lances? I have not required to lance a whale for many years-I know not how many. Find the lances, Sigurd, and send the men to me.'

Presently the six sailors stood before him.

'I am going to lance yonder blaa-hval,' said the old man. 'It is, perhaps, a little risky. I will take the larger boat and three men. Which of you

The six, with one accord, declared their readiness.

'Then I must choose. I take you, Hans, and you, Fred, and '-

The second-mate, having begged Sigurd to take the wheel for a moment, came running forward.

'Well, Einar, what is it?' asked Svendsen coldly.

Einar came close to the captain, his face working. 'Take me, kaptan,' he whispered.

So?' said Svendsen inquiringly.

'A chance, kaptan; you said you would give me another chance.'

The old man's keen eyes softened.

'For-my father's sake, kaptan.' Svendsen cleared his throat and turned to the

'Hans and Fred, lower the boat.-You, Einar, will steer.'

The boat moved cautiously and silently over the smooth swell under the clear sky. Pans of rotting ice gleamed exquisitely here and there; in the distance, under a white haze, lay the sheet ice, and nearer a small berg or two broke the monotony of gray-blue space. The whale had gone under, but his position could be judged not inaccurately from the cable that stretched tautly from the Thorgrim's bow to meet the water at a small angle. The 'blue' was now making slow progress, for the screw of the Thorgrim had been reversed and was acting against the mighty flukes.

When the 'blue' broke the surface at last he paused -it may have been in suspicion. An instant later the boat's bow bumped ever so lightly against his slaty hide, and Svendsen's great hands and arms rammed the long lance through blubber and flesh.

For a quick breath it seemed as if the 'blue' were paralysed; then he slashed air and water with his awful tail. And Kaptan Svendsen's 'little risk' had become great danger. His boat was in fragments and he and his men were in the water.

On board the Thorgrim there was a rush to lower the second boat, while Sigurd, with a hatchet, leapt on the platform and hacked at the hemp, for now the whale, slowly but surely, was towing the Thorgrim from the scene of the disaster. The threeinch cable snapped with a loud report and flashed, a yellow streak, out of sight.

Then Sigurd ran back to the wheel and steered the Thorgrim towards the victims. The four men had been thrown in two directions by the blow. With the help of a couple of oars, Hans, his face bloody, was supporting Fred, who was afterwards found to have an arm and three ribs broken.

Fifty yards farther away Einar held on to the steering oar, and near him Kaptan Svendsen struggled in the direction of the Thorgrim, now rapidly approaching. But the old man's heavy boots and clothing were beating him, bearing him down. He gasped painfully.

'Kaptan,' spluttered Einar, 'take the oar.'

'No, Einar. Your father '-

'I can swim,' replied Einar, and pushed the oar towards the old man.

'Einar'-He caught the oar.

'I can swim. Ah, kaptan!' sighed Einar, and straightway sank.

Kaptan Svendsen took his hands from his worn

face and looked across the cabin-table at his mate. The Thorgrim was making for the station.

'Why,' he asked piteously-" why did he say he could swim, Sigurd ?'

'I think,' said the mate slowly, 'it was becausebecause you were his kaptan.'

'And-and because of his father, perhaps?' 'It may be so, kaptan. Who knows?'

Svendsen sighed. 'His father's heart will be very sore, Sigurd.'

'And, I think, very proud,' said the mate gently.

Their long search for Einar had proved vain. An undercurrent, perhaps. There is always the undercurrent to be reckoned with in the sea, which is deep-in man's nature, which is deeper still.

CASTLES IN THE SANDS.

I sat one night aweary in my room; The lamp was low, my book was laid aside, And in the silence I could hear the boom Of the returning tide.

I thought of all the castles in the sands My little ones had reared with loving care-The wondrous structures of their tiny hands, That seemed to them so fair.

I knew that now, o'er turret and o'er keep, O'er all their work, rolled the complaining sca; And that the prisoners in the dungeons deep Had been at length set free.

Ah, how akin to castles in the sand Are the frail purposes and plans of men! They rise a little, then an unseen Hand Topples them down again.

He was a poet to the finger-tips, A daring soul who the despairing hailed; Who set the golden trumpet to his lips And honoured those who failed-

Who failed and fought and wrestled to amend, Heedless alike of men's poor praise or blame; Who made their failures steps to one great end, And set no store by fame.

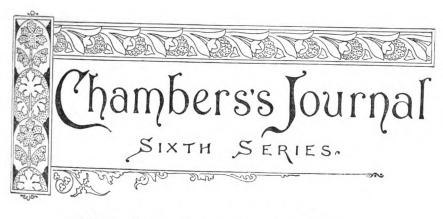

Duty impelled them as the needle sets, 'Mid wind and wrack, to the controlling star; So they beheld amid life's cares and frets Their shining goal afar.

By what is done-and haply they are right-Men judge; but He who reads the anxious heart, And knows its tears and travail in the night, Rates right the other part.

Even as the sea o'enflows the yellow beach, Obliterating castles in the sands, So God's wide mercy human faults can reach; He knows and understands.

HUGH CROSS.

* Josquin Miller.

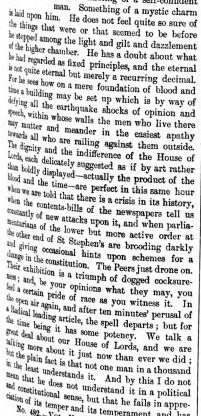

THE HEART OF THINGS.

By HENRY LEACH.

LONDON, February 23, 1907. walk into the House of Lords in

these days and watch the Peers for the little while that they are at work is an experience that may often result in the humbling of a self-confident

ciation of its temper and its temperament, and has

even but the clumsiest notions of how it does its work. Only the other day, by the kind courtesy of an eminent and well-respected member of this House, I was favoured with a privately published volume of essays by him, in one of which, on the question of the future of the House, there occurs this passage: 'Happily for Great Britain, there exists no constitutional means of forcing the Peers to abdicate the impregnable political position they hold; and although they may be persuaded to reform themselves, we may rest assured that they can only be driven from the citadel of power at the point of the bayonet.' This is the considered expression of a nobleman of extremely well-ordered mind, pacific disposition, and high achievement. Wellington once observed that nobody cares about the House of Lords; and though people do care in a sense now, they have not the knowledge. The average man who reads his newspaper could tell you a fair amount of the contents of Dod's Parliamentary Companion, or the M.P.'s Bible, as it has been called, concerning the House of Commons; but he is ignorant even of the fact that in the Upper House votes are not taken by 'Aye' and 'No,' but by 'Contents' and 'Not Contents,' and that the Lord Chancellor has no casting vote in case of equality of the opposing parties as the Speaker has in the other House. The life of legislation is all so different in the Lords from what it is in the Commons. Lord Lansdowne, the Conservative leader, speaks in a low, subdued, cold manner quite in conformity with the haughty dignity of the chamber. So do all others; no scenes, no excitement, no animation. So far as the Peers themselves are concerned, it is all browns and grays; and in the matter of their dress and accoutrements they are the dullest, most unimaginative set of men to be found anywhere. The Archbishops and the Bishops do not help them at all in this matter, for they never seem quite appropriate to the occasion; and their magnificent dullness is accentuated by the general brightness of the gilded chamber, with its rich ornamentation, its costly emblematical trap-[All Rights Reserved.] FEBRUARY 23, 1907.

pings, and its occasional sprinkling of beautiful and magnificently decked Peeresses in the gallery. It is not an easy thing to go into the Lords; but it is a pity that we don't go oftener than we do and learn a little more about it. The popular impression that the Lord Chancellor is to the Lords just what the Speaker is to the Commons is entirely wrong. He has none of the powers and the privileges of the Speaker save that of putting a question. He has no right to call the assembly to order; and occasionally when, forgettingly, he does so, he is perhaps reminded of the fact by some one or other. The Lords do not address him, but the company generally as 'My Lords.' There are no particular places for anybody, and they sit in any order. There is the easiest fraternity among them all; there is very much of the old-fashioned family party about them. Such is the fine dignity, such the independence and the don't-care spirit, and such the apparent happiness of the whole thing that it seems a pity almost to meddle with it. You would not spoil any of these things by taking away a few members, for there are several who never would be missed; but in adding to them there is danger. And yet see how the House is growing with the birthday and all the other honours! Seventy-seven years ago its numerical strength just turned the four hundred corner. In 1890 there were five hundred and fifty-four Peers; now there are six hundred and nineteen.

Generally speaking, the ways and habits of the people of great nations are not much affected by the alliances and understandings into which the Ministers of those nations enter on their behalf. Be the entente ever so cordiale, and the possible Channel Tunnel ever so wide, it is fairly certain that not a particle of the French feeling of life will ever come into our British systems. Nature always seems to offer a resistance, and the most that can ever be expected is that the plus of one people will by juxtaposition cancel the minus of another, and that there shall thus be made a neutral compromise in some small matter. When it seems to be suggested that an effort is being made to combat this rule, and to absorb into us something of the feeling of foreign friends of a different race and of a vastly different history and training, there is occasion for consideration. We have all admired the Japanese, their magnificent energy and determination; and yet how very seldom have you ever heard a Britisher saying that we ought to take a leaf out of their books in any way whatever save that of efficiency! When the Japanese were doing mighty deeds on sea and land, the English ladies in the West End of London betrayed their sympathy in divers pretty ways, even to the extent of here and there a slight Japanese affection of dress; but it never got further than that, and since then there has perhaps been a tendency to be a trifle more severely analytical of the brave little men and noble little women of the Empire of the Far East. I have been led to the

present fancy by observing a coincidence in which there seemed to be some little significance. The other day Mr Haldane was in Edinburgh, and he set before his audience the example of what Japan had done by organisation and culture, and what a great nation had been made of men with an inspiring faith; and it so happened that at virtually the same time I was privileged with some conversation upon matters of national training and certain tendencies in the British disposition and character with the Earl of Meath, who might reasonably be said to be one of the very highest authorities on such a subject. Educated partly at Eton and partly in Germany, with diplomatic experience in the latter country, and a fine record at home for the encouragement of moral and physical education among our young people-he has been at the head of almost every movement for the encouragement of both in recent years—and a man of broad views and wide sympathies, he is one to whose words on these subjects great weight attaches, and he deplores the ease and happy-go-lucky spirit which animates us in the training of young Britain now, as the result of which some race deterioration is to be feared. He would like to see the introduction into our system of something more of the discipline of Germany and the self-sacrificing patriotism of Japan, which would make us unconquerable in peace and war. What is wanted, he said, is that our system of national training should be imbued somewhat with some such sentiments as those which governed the principles of bushido- the way of the warrior'-the ethical code of the old Samurai, a set of rules for which were drawn up by Kato Kiyomasa, a Japanese general, four hundred years ago, one of the chief articles of which laid stress upon instilling into the minds of the young the necessity for cultivation of the virtues of loyalty and filial piety. The spirit of bushido practically animates the whole of Japan to-day, and has led to its marvellous regeneration. 'Japan,' said Lord Meath, 'has proved herself mighty in war, and because of this spirit she should prove herself as powerful in peace as in war. Every man feels the national responsibility upon him. He is Japan. If the spirit of bushido be fully realised by the people, there should be no laziness, no carelessness, no slipshod work, and no grinding of the faces of the poor. I do not suppose that the people of Japan will reverse all the experience of ages, and ever thoroughly live up to their ideals; but let us ever remember that "he who aimeth at the sky perchance may hit a tree." If their ideals are realised, workmen will not scamp their work and employers will do their duty. There is room for the more strenuous cultivation among ourselves of the virtues of loyalty, patriotism, reverence, and obedience to lawful authority; self-sacrifice, endurance, courage, and devotion to duty. The Japanese live simple lives, and their moral fibre has not yet been weakened as, I fear, the British to some extent has been by prosperity and luxury.' Yet, be it said, the Earl of Meath is known to all as an optimist above all others, and the keynote of his musings always is contained in such words as confidence and hope.

* * * The Press of the country is a matter of such high national importance that any striking departure in the wars and customs of Fleet Street may reasonably be regarded as a matter of national consequence; and though the outside public may have heard little of it-how much they may have seen by the time they read these lines I am not prepared to hazard a guess-such a departure has for some little time been a matter of anxious talk in Fleet Street. The proprietor of one of the strongest newspapers of the time has gone to the length of engaging one of the chief editors of a leading New York journal to come to London to edit this London daily, and it is currently reported that a salary of five thousand pounds a year is being paid to him to do it. He 1, so it is said, given a free hand in the 'Americansation' of his new paper; and what the results, and how far-reaching they may be, are things which we have yet to learn. Some people prophesy success; others declare that American journalism will no more mix with British readers than oil will with rater. But if half that is said about the future omes true, there will be cause to think. It seems that we have already assimilated most that is good, and some that is not good, of American methods. There is a story told among journalists of a curious neibod in which a famous American newspaper one occasion beat its rivals. The Presidential Mesage to Congress was given beforehand, as und, to a news agency on the distinct undersanding that it was not to be sent out to the Apers before a certain time. But late at night the manager of one of the papers informed the agency hat it had obtained the Message by other means, and was going to print it in the next morning's The agency protested, implored, but to no rupose; and so that its customers generally might to be left behind, it felt obliged to deliver the Message to them all itself, including in the routine the paper that caused all the trouble. Tall was the first that paper saw of the Message, leanse its story was all a piece of bluff; but it tond, as it expected to do, by the fact that it knew n rould get the document to print, and had all its printers and arrangements ready for the purpose, rheras the others had not, and the Message was ant round so late at night that they were almost beloless, and could only 'do a summary.' That The long ago; but how the fancy reels before the is of tampering with our King's Speech in such Tag: The idea of the American editor for the English newspaper is not, however, absolutely ber though the meditated thoroughness of the Americanisation is Many years ago one of the raid editors of the New York Herald came to an hapmant place in Fleet Street, and he is now not the very clever and judicious but popular cillor of one of the leading dailies. Other Ameri-

can journalists, as I have met them in London, are models of enterprise combined with common-sense; but so far none of them have suggested that an eagle should be placed among the title words of any of our papers instead of the British royal arms. Of course, in the modern newspaper world it is fatal to stand still for the space of one minute. Something new and good must constantly be done. One great newspaper of the day which is not at all American in its method is rearing up for itself at the present time a new home built on an American system round an iron skeleton. Within the last two years three important London evening newspapers have died. Life in Fleet Street is very strenuous, and the leaders need strong nerves and bold courage.

The mongers in local politics and the newspapers are making mighty efforts to create some excitement in big London just now; and in the course of a few days, when the County Council elections are completed, we shall see what they have all amounted to. If one speaks of these efforts with a soupçon of carelessness, it is not that one has not the fullest appreciation of the importance of the occasion and of the fine civic patriotism of those who give their labour, and often enough the energy of their whole lives, to a task which almost less frequently than any other of a public character yields them any reward of general appreciation. There is only one other election in the British system that is of more importance than that of the London County Council, and the issues that regularly depend on it are of enormous consequence. But the fact is that, despite all the talking, and the newspaper headlines, and the scares, you cannot. reason, or coax, or frighten the Londoner into any regard for even the very best sorts of local politics. The old Londoner and the young one-the rare man who (like his father and his grandfather before him) was born within the one square mile of the City and he who has only just come up from the North-are just the same. The London habit is infectious; you fall into it at once. And one of the salient features of that habit is indifference to the small and regard only for the great. Except for this brief present period, and to a lesser extent on one or two other occasions during the year, the newspapers that are published in Fleet Street fulfil exclusively a mission of treating upon Britain and the world; the purely local press of London is little heard of, and in several of the suburbs the papers have to be given away, and are delivered free at the doors of residents. Kings and queens and the men and women who are making the history of the world are the only visitors of whom the metropolitan takes account. Subconsciously he certainly regards the Houses of Parliament as his own particular governing body, and in much the same light that the citizen of a thriving provincial city would regard his city council. It is, as Boswell remarked in one of his interludes, that the intellectual man is struck with London as comprehending the whole of human life in all its variety, and the people who witness this variety and live the wider life cannot exalt their sense of duty to the point of bringing their attention to bear upon comparatively parochial matters. Their mode of thought is not so much too imperial as too general for anything of that kind, and so it comes to pass that London, which seems veritably to be the heart of all things, and which sometimes you may be led to fancy as the heart of the universe itself, has no heart of its own. All the efforts of the mastersurgeons in local government have failed to make its pulse show any signs of life-even to find its pulse; and such methods of inducing artificial respiration as by borough councils, so successful elsewhere, have quite failed of effect. There is something pathetic about the meetings that are sometimes held by the little army of the local mayors of big London for the purpose of devising means for the sustenance of their sense of dignity with some few crumbs of pomp. Only the other day in solemn privacy they held such a meeting to determine precisely when they should wear their robes of office, when the chains, and when the badges; secondly, when they should adorn themselves with combinations of two of these things; and, thirdly, when they should wear all three. An elaborate set of rules was drawn up, showing how the worshipful mayor shall be a Solomon in glory when there is royalty at hand, and how at charity meetings and bazaars the magic of his name shall need assistance from the badge alone for the furtherance of the purpose of the time. The local mayors of London are a deserving body of men, but their offices are the least enviable of their kind that are to be found anywhere. And another great reason why the Londoner cannot now be coaxed to the municipal habit is because he has not been given to it in the past, and in the manners and the methods of his life and the old traditions of his general ways he is a prince of conservatives. The City, indeed, has fine civic traditions and modern enthusiasms, because it has always had them; it is the same in a lesser degree at Westminster and Kensington; but for new authorities built with vandal hands the Londoner has no stomach. In just the same spirit he does not take to new buildings, to new gardens, new roads. In the matter of roads and routes, indeed, his unreasoning conservatism reaches its highest point. Let the Londoners be established in one way of going from one place to another, and they never will go by any other route however superior may be the advantages offered by it. Of this we have had one fine example in our midst for a long time, and lately there has been added another to it. One of the most magnificent thoroughfares, and the most picturesque, in London is the Embankment. and yet it has always been comparatively deserted, notwithstanding the number of 'short cuts' to which it will help pedestrians and others. Now

there has been the magnificent new thoroughfare made in the very centre of busy London, called Kingsway, giving a quick connection between those two main arteries of traffic, the Strand and Holborn. The cost of this road has been fabulous; land hereabouts is as precious as if it were paved with gold. Only what appeared dire necessity, the remedying of a great evil in inconvenience, encouraged the authorities to the making of Kingsway; and when they made it they made it well, saying that it should be one of the glories of the town. And now that it is made the people will not walk along it! They cling tenaciously to the narrow, winding lanes of their experience; they go the long ways round from Holborn to the Strand. So it comes to pass that at nights one will look down Kingsway from its beginning as along a dark and lonely road with a fancy of strange dangers and evils that might beset the traveller along it. If you must walk there you do so quickly, not turning the head behind, and you feel glad to be come again into all the glare and the life whether it be at the north end or the south end of this sequestered way. They are not building shops there; the street newsvendors and the gutter-merchants will have little or nothing of Kingsway. Already, with all its spaciousness and its noble conformation, it is in danger of becoming a pariah among thoroughfares, all because of this deadly conservatism of the metropolitan. Kingsway is being cut! In London, indeed, as elsewhere, our tempora mutantur, but it is not so true that mutamur in illis.

By this time the vast supply of new pence and halfpence which was coined at the Mint towards the close of last year will have circulated pretty generally throughout the country, so that almost every time one gets change for sixpence there is a bright new coin among it, and perhaps more than one. As was officially explained, the country was lately suffering from a dearth of coppers due to the penny-in-the-slot machines. This seemed to come about rather suddenly, for I was told by an official of the Mint that some two years ago those people whose business it is to find out the state of the coinage, and regulate it, reported a most abnormal superabundance of coppers, so that for more than six months the issue of pence was entirely suspended in London. This may result some day in people placing a fancy value on 1904 pennies, with the notion that they are really scarce, and that the Mint needs them for some reason or other. Such an idea actually prevails at the present time, and has done for many years, with regard to 1864 pennies. Those who entertain it imagine that such coins are received at the Mint and paid for at ex traordinary rates. So they take them there, and are duly disappointed. In one case an applican asked for seven pounds eleven shillings and four pence for each of several 1864 pennies that he had which he said he understood was the present rate purchase by the Mint!

THE LORD OF THE MANOR.

CHAPTER XIV.

4

MAYNE CASTLERAYNE rose with dignity. He could not quite understand why anybody should venture to disturb him at this time of night. No gentleman would intrude in the dinner-hour. The visitor had been

asked into the library, of course. It was the two gris who looked so frightened. By the instinct of their sex they had guessed what was taking place. May shuddered; she put down the section of a peach that she was peeling, and the sight of the col, luscious fruit filled her with loathing.

'It has come,' she whispered. 'I feel quite cerwin of it. Why did not dad --- But why do I ask so silly a question? As if he would ever do the proper thing without being forced to it. If he had followed Mr Summers's advice we should have been spared this crowning indignity. It is ad enough to have all these creditors, and nowand never forget that afternoon at the Montagues'. ir though they are living now in a small house a Hardborough, they are quite happy.

is may not be quite what you think it is, Angela said.

You know that it is; you are as certain as I m. 0h, the shame, the vulgarity of it! They are dreadful creatures behind who smoke pipes addrink beer. Ada Montague told me all about t Oh, if I could only do something!

May paced restlessly up and down the room. the longed for some outlet for her fierce energy. l semed almost impossible to believe that in this Test refinement, this cameo amongst homes, the apol reality had clutched like this. A grip with timy fingers, too, and nails in mourning!

Ir Castlerayne crossed with leisurely step to be library. A little, fat man, with a hot, greasy are and impudent eyes of shallow blue, sat there tisting softly. A hard bowler hat lay on the alle on top of some white foolscap papers. Calentne would have frozen his visitor at a take; but the imperturbable stranger merely rose ad lade his involuntary host a cheerful, not to ar impudent, good-evening.

Sorry to trouble you, Mr Castlerayne,' he said; but I couldn't get here before. And, after all, the things are done better in the dark. It's the little matter of Craggs and yourself, suit of Manifis solicitors—one thousand two hundred si steaty-one pounds four shillings and ninesee costs in the action. From the office of the and you know. Of course, if you can pay me noner, sir, I give you a receipt, and there

and if not? Castlerayne asked. If it is not convenient to pay you a cheque? Couldn't take a cheque, my dear sir; cash or

notes. If you don't pay I shall have to leave my man in possession. It is a mere formality, of course; but the man will have to stay till the claim is satisfied or you put your petition in bankruptcy.'

'I have no means of paying you at present,' Castlerayne said hoarsely.

'Right you are,' came the cheerful response. 'In that case I'll call Bob. He's in the hall. If I hurry up I shall catch the ten train back to Hardborough.—Here, Bob; come this way.—You'll find Bob quite harmless, Mr Castlerayne.' little man vanished without further ceremony.

A tall, melancholy individual, with sombre eyes, lounged awkwardly into the library. He resembled nothing so much as one of Leech's sketches of the mute who used to follow old-fashioned funerals. His mouldy black suit was several sizes too large for him; he had not washed within recent memory.

'Good - evening to you, sir,' he said huskily. 'Name of Bob, sir. It is unfortunate as you have got to put up with my company for a day or two. Not that I shall trouble anybody. Give me a bed or a sofa, and my three meals a day, with beer, and I'm willing to make myself agreeable. Which mine is a hard life at the best of times.'

Castlerayne nodded his head slowly; he could not have spoken just then for a kingdom. He felt as if all the world were slipping from him. He was only conscious of the damp, mouldy smell of the intruder's black garments, of the odour of the thick boots. That lank, dark figure seemed to fill the entire atmosphere.

'Where am I going to sleep to-night, sir?' the

Castlerayne roused himself with an effort. He picked his scattered senses up one by one. Something had to be done with this dreadful incubus. He would have to be lodged and fed. And the servants would have to know; it was impossible to keep this from the servants. Castlerayne rang the bell and explained to the butler-at heart he had an idea that he had explained. He dragged himself into the drawing-room, pulling one leg after the other. There was a ghastly smirk on his face; his lips were blue. Angela positively recoiled from him.

'What is it?' she stammered. 'What has happened, father? I heard a voice say '-

'Yes, yes,' Castlerayne said thickly; 'it is the man in possession. He says that he is not likely to cause us any trouble, so I have handed him over to the servants. It seems very strange to think that here, in the old home of the family '-

The speaker paused and threw back his head. A peal of loud laughter came from his lips. The discreet silence of the house rang with it. The

thing was so unnatural, so strident, so terrible, that May held her hand to her father's mouth.

'Oh, hush, hush!' she said. 'Do not go on like that. I had no idea that you felt the strain so much, that you realised how—— Come and sit down.'

The laughter had died away to a shallow cackle. Castlerayne collapsed into a chair, and his eyes closed. Nothing could be heard but his stentorian breathing. The silence was all the more oppressive by very contrast. May turned and whispered something to Angela, who rang the bell. The old butler came in scared and agitated.

'Your master is ill,' May said. 'I am afraid he has had a shock. If you will be so good as to get somebody in the kitchen to go for Dr Marfell'—

'I'll go myself, miss,' the old butler said. 'I know exactly what has happened. And if you will pardon me for saying so, miss, it was bound to come sooner or later. And there isn't one of us in the kitchen as isn't as sorry as you are, miss. We'll take good care as you're not troubled by that man, miss, even if we have to make ourselves affable to him in the kitchen.'

'I am sure you are all very good,' May said tearfully.—'I hope to goodness I'm not going to begin crying now. Oh Angela, if Aunt Gertrude were only here now!'

But Angela had already left the room. May stayed there by the side of the chair, holding a cold, limp hand, and chafing it in her fingers lovingly.

The little house in the hospital was all in order at last, everything put in its place. It was a pity that nothing now remained to be done, Gertrude Castlerayne thought, because the time had come that she had dreaded, the hour when she could sit down and think. That being so, she cleaned out the cage of her canary for the second time in the afternoon, much to the annoyance of the somnolent bird, who had suffered sufficient change for one day. For the moment the eternal knitting had been mislaid; and, besides, Miss Castlerayne was not in the mood to sit down and knit to-night. She could hear some children still playing on the lawn outside, though it was quite dark by this time, and in the next cottage Mrs Masters was obviously putting the smallest of her grandchildren to bed. It was very hard for that poor woman to be saddled with children at her time of life, but then they would have been worse off in the workhouse. It was a vision like this that reconciled Miss Castlerayne to the step that she had taken with regard to the hospital. And before long there was going to be ample provision for the old people.

The children outside quarrelled presently; the sound of a smack floated on the heather-tinged air. Then there was something to do, a mission of forget-fulness. A few moments later, and the two little girls were in the cottage, one on either side of Miss Castlerayne, the pretty faces all smiles again; and never before had they listened to such a fairy tale

as tickled their ears now. The blue eyes glistened; the light of the cheap lamp touched hair that had a warmer sheen of bronze in the shadows. They were pretty children, and they were clever children, which is the more valuable asset so far as the fastidious are concerned; and yet they would have looked commonplace and dowdy in workhouse poke-bonnets.

There was a knock at the door presently, and Mrs Masters's hard, gray head looked in. The vengeance in her eyes softened. Much hard work and much privation and sorrow had hardened a heart that was made to be soft and tender. Miss Castlerayne smiled a welcome.

'Well, I never!' the old woman said. 'I couldn't make out what had become of they dratted children. I thought they'd gone off somewhere. And I've had a time getting their little brother to sleep. Still, I do my duty by them, as I promised their mother I would, poor girl!—And what do you want to come and worry the lady like this?'

'They didn't,' Miss Castlerayne said, with that smile of hers that brought any child or dog in the neighbourhood to her side. 'I fetched them in I am afraid they were having a little difference of opinion, so I got them to come and keep me company, and I told them a fairy tale. I am feeling very lonely, Mrs Masters.'

'Which I can feel for you, miss,' the elder woman said. 'I loved my old man and all my children; and but for you and the grace of God I should have ended my days in the House. And here these children of mine worrying you like this!—Come to had'

'Let me come and help you. I'm not used to idleness.'

It was almost a royal function in its way. Never had the pretty, blue-eyed little girls been put to bed like this before. Under Miss Castlerayne's gentle sway, the brushing of hair even had realised itself into a pleasure. The little ones had deemed that ceremony impossible hitherto without much tugging of tangles and vexatious tears. There was a ring of sincerity in their prayers that was quite unusual. As a token of gratitude, both the children conceived the intention of going to live with Miss Castlerayne as soon as possible. The whole thing was so pleasing that the lonely woman forgot her troubles for the time.

She set out her frugal supper, and afterwards washed up the plates with her own hands. She was just a little afraid to go to bed; she had made up her mind that she was not going to break down, and she had her doubts as to her own strength of purpose. She wondered what they were doing at The Towers now, if Angela was in the drawing-room yet. She could see Angela in her black dress, with the whiteness of her arms and neck gleaming through the network of lace.

And then the door opened, and Angela in the flesh stood there. She was wearing the black dress. Her clear, healthy flesh glowed in the light of the cheap lamp; but there was no smile on the face of the girl. A tragedy was in her dark eyes.

'I knew that we could not do without you, Aunt Gertrude,' she said breathlessly, for she had come across the Common fast. 'The worst has happened the very worst. And dad has had a kind of stroke. We can do nothing with him. Come with me at once, dear.'

They sped over the Common together, leaving the door open and the light of the lamp flaring like a beacon behind them.

(To be continued.)

SOME WONDERS OF MEDICINE AND SURGERY.

By Dr Andrew Wilson, F.R.S.E., &c.

N all the range of the sciences no department of thought and practice has advanced with greater rapidity during the last quarter of a century than that branch of inquiry which deals with the causes and the cure

Not merely have our stores of knowledge been largely added to regarding the exact nature of many ailments the causes of which were obscure, but still more in the direction of modes of successful treatment of diseases previously conaddred incurable has the science of medicine progreated. It is of extreme importance, however, to note that all real advance in the healing art is really founded upon the scientific appreciation of the problems which disease presents for the consideration of the medical man. To take a case in point. There exists in the neck-region of man a certain organ known as the thyroid gland. This gland is divided into two halves, one of which is found on each side of the windpipe, the two lobes or parts being connected by a narrow bridge or shmus This organ constituted a grave puzzle in respect of its nature and its duties to the older physiologist. Unlike the liver or sweetbread, each of which manufactures a fluid of service in the digestive work, the thyroid gland did not appear b be concerned with the secretion of any particular substance. Examination of its structure by aid of the microscope did not reveal any special features such as might have formed the foundation of some adequate theory of its functions and uses in the hame. Only through its relations to a very curion ailment was the nature of the thyroid gland

It is needful here to explain that in hard-water destricts this gland is apt to be enlarged, forming a tumour in the neck-region to which the name of goitre is given. Locally in certain parts of Eagland this trouble is known by the name of 'Periyshire neck' and 'Yorkshire neck'. The influence of drinking over-hard water, or, as some physicians are inclined to believe, the result of laraking of water containing certain minerals wher than those which contribute to the hardness of the drinking-supply, appears to act upon the throid gland in a very peculiar fashion, causing it to enlarge, and sometimes to a very great extent. Furthermore, however, it was discovered that in a particular form of idiocy known as cretinism

the thyroid gland was either very imperfectly developed or morbidly enlarged, so that fresh light was thrown upon the function of this gland in respect that its absence or defective development was accompanied by a considerable alteration of body and likewise a deficiency of mental powers. The problem was attacked from a third point of view. A certain condition of body is known as myxœdema. Briefly stated, in this ailment the bodily powers fail at large, whilst the face becomes swollen and the skin baggy, the general appearance of the patient presenting somewhat the aspect of a person suffering from dropsy. In addition, the brain-power fails, the person sinking into a state of what may be called mental indolence, and ultimately becoming incapable of effectively governing and controlling his or her life. Here again the mysterious thyroid gland was found to be involved. Myxœdema was discovered to be accompanied by a decrease in the gland in question.

Such a collection of evidence clearly pointed to the fact that the thyroid gland was to be considered a highly important organ of our economy. When its functions are duly investigated, they are found to comprise the manufacture of a secretion which is poured into the blood, and which appears to be essential by way of enabling the vital fluid perfectly to discharge all its functions in the body. When the thyroid gland ceases to pour this manufacture into the blood, disease of the nature I have just described begins to be apparent.

Now follows the interesting question of medical advance in the way of cure. Knowing the cause of disease, we are capable of then devising scientific means for cure, in place of representing what is known as the empirical practice of medicine; that is, experimenting with this remedy or that, and endeavouring as a mere result of experience to discover which means is the best calculated to effect a cure. Dr Murray, of Newcastle-upon-Tyne, logically following up what was known regarding the functions of the thyroid gland, conceived that if the substance of this gland taken, say, from the sheep could be administered to patients, there might naturally follow improvement and cure. The results of experiments fully justified this expectation. The first treatment of myxœdema was that of injecting the substance of the thyroid gland into the system through the skin. Later on it was found that if the thyroid substance were administered by the mouth, practically as part of the food, all the good results which follow injection into the skin were obtained, and so to-day we find the pharmacopæia contains the dry, powdered gland of the sheep, which is duly administered, not merely in cases of myxædema itself, but likewise for the improvement of cretinism.

The example I have just given stands out very prominently in modern medicine as an instance of the valuable results produced by following the plain logical track of investigation into the nature and duties of a given organ. In this sense, if the pathways of disease could be as clearly traced and outlined as are those which mark ailments due to alterations in the thyroid gland, we should be able in much more definite and in quicker fashion to obtain, for many serious ailments which affect us to-day, adequate means of cure.

In the department of surgery, as opposed to that of pure medicine, advances have been made of a nature which to-day may well cause those who are acquainted with the state of medicine in the sixties and the seventies to rejoice in the improvement of surgical methods, and likewise to indulge in legitimate surprise at the rapidity with which improvements in treatment have been made. No doubt the surgeon has a great advantage over the physician in the sense that he comes more directly into contact with the disease states which it is the object of his science and art to cure or relieve. From the nature of his particular inquiries, the physician literally has often to work in the dark. The surgeon, on the other hand, lays bare the seat of disease, and the great advance of the surgical art in modern times may be summed up in the statement that the modern surgeon has learned that practically no organ or tissue of the body is to be regarded as lying outside possible interference.

No better or more instructive example of this latter fact can be found than in the case of the brain. It certainly had long been known that persons who were suffering from head injuries, and who had lost a relatively considerable amount of brain-substance in consequence, frequently recovered, and in many cases did not exhibit such marked failure of the mental powers as might have been expected when regard was had to the severity of the accidents. As a matter of fact, the brain itself is not an extremely sensitive organ, and head injuries mostly concern the surgeon from the point of view of the brain-case itself, and not so much of the organ which that case is intended to contain and protect. Many instances are on record in which extremely severe brain injuries have been recovered from with a facility that has surprised even medical men. But when the question arose of surgical interference with the brain, by way of removing from its substance tumours and growths tending to derange its functions, the matter assumed a somewhat different aspect. In the first place, it was necessary to note the duties or functions performed by different parts

of the brain. This knowledge came to us from the researches of various observers; and to-day, as a result of such investigations, we find the whole surface of the brain mapped out with accuracy in respect of the duties discharged by each part or area. I need hardly remark in passing that these areas do not correspond in any sense with the divisions one sees in a phrenological cast of the head. A new phrenology, if I may still use that term—that of science—has ousted the old.

The functions of the brain being known, it became an easy matter to diagnose or identify particular symptoms exhibited in brain diseases with affection of particular areas of the brain. Twitchings of certain groups of muscles, for example, are related to the part of the brain which covers these muscles, so that if the surgeon and physician together have reason to suspect that any special area of the brain is involved, say through the existence of pressure of a tumour, the surgeon can to-day safely cut down upon the spot, remove the tumour, and not merely in many cases prolong life, but effect an absolute cure of the case. Such brain operations, in fact, represent one of the triumphs of modern surgery, rendered possible not merely, as in the case of the thyroid gland, by the definite and efficient research of science into the natural functions and duties of the brain, but also aided by the experience of the modern surgeon, and, I need hardly add, by the fact that through the action of chloroform and other anæsthetics, the abolition of consciousness on the part of the patient is perfectly

I can well remember when the membrane which lines the abdomen, and is reflected over its various organs-a membrane known as the peritoneumwas regarded by surgeons as a singularly dangerous structure, in respect of its assumed liability when touched or irritated to pass into a state of inflammation. This view, through improved surgical practice, has been entirely exploded. The peritoneum to-day, in various serious operations, is practically as freely handled as is the skin, and very many serious internal diseases, especially of the nature of tumours, are removed with perfect safety to the patient. Indeed, the death-rate from such operations presents to-day, in respect of its lowness, one of the most satisfactory testimonials of the perfection to which the practice of surgery has attained. This special aspect of the matter relates itself in a very marked manner to an ailment which of late days has become unfortunately only too well known by name to the public. I refer to appendicitis. The affection in question implies inflammation of a small rudimentary or vestigial organ attached to the first part of the large intestine. It undoubtedly represents in man the remains of a structure which in certain phases of lower life continues to be large. Subjected as it apparently is in modern civilised life to irritation of various kinds, arising from various sources, the appendix exhibits inflammatory action, which if notern physician, as the result of his experience in other directions, fearlessly tackles the appendix and removes it. In this way thousands of lives are sared year by year which in former days were scrifted to the natural fear of the surgeon to meddle with parts or to interfere in conditions approach to be beyond the reach of human aid.

Even an organ like the heart, which might artainly be supposed to lie outside the sphere d the surgeon, has now come to be included vithin his province. Not so very long ago a case occurred in London where a man stabbed in the hart was taken to hospital. The wound in the beart was duly sutured or stitched, and the patient made a perfect recovery. Surgery in this case and a saved the assailant from being indicted on the capital charge. The heart is, of course, a bollow muscle, and in the case of a wound of this organ everything must depend upon the particular part which has been injured. If a vital part, and the closely connected with what we may call the memal mechanism of the organ, has been touched, recovery, of course, is impossible; but where the Ebstance of the heart itself has alone been affected, energies enabled to place the patient in a condiis souring recovery, and this notwithstanding ix apparently constant work of the organ. For ctample, last March, a negro, thirty years of age, rs treated for a wound of the heart in New York. to show how an otherwise severe injury may not breasily be a fatal one, the patient in this case raked a certain distance to the hospital after being njured, and within forty-five minutes was operated ma The wound was on the left side of the hart, and at the base or upper part of the left Politicle. After due treatment the patient rearead. In another case, reported at a German rigial congress, a wound of the heart was successtreated, the injury being on the right upper arity or portion of the heart. It is related that wound in the heart was closed by three silk and, although the patient suffered from a coplication of troubles thereafter, his recovery The perfect, and he was able to follow his trade, vich was that of a butcher.

Suprems know that in a certain number of the where the heart has been injured, patients

may recover without any operation at all, this being, of course, due to the fact that the wound in the heart closes of itself, a result which, again, depends very materially upon the part of the organ affected. More extraordinary still are those accidents in which injuries to the heart have been inflicted by bullets. Here it might be assumed greater laceration or destruction of the heartsubstance takes place. Yet many cases are known to military surgeons and others in which perfect recoveries have taken place as the result of efficient surgical treatment. Indeed, individuals are alive to-day who carry about embedded in their hearts bullets which have, so to speak, made themselves somewhat at home, and which have through the wonderful power of accommodation of the organ remained in the heart, giving little or no trouble. In one recent case I read that a French soldier was wounded in the left side by a ball from a pistol. The bullet was implanted in the left upper chamber or auricle of the heart. At first no very serious symptoms were experienced, but ultimately the patient sought relief on account of difficulty of breathing, pain, and other conditions. The heart was photographed by means of the X-rays, when the bullet was seen on the left side of the heart, at its base. It was fixed in the heart-substance, and moved with the impulse of the heart. An operation was undertaken, the bullet removed, and the patient made a complete recovery.

Such a recital, amongst others, tends to impress upon our minds the idea that to the advances of the healing art there can be practically no limits set. If we take into account, also, such methods as are represented in the cure of disease by substances known as antitoxins, obtained by cultivating disease-germs in the body of an animal, and obtaining the curative substance from its blood, we note an important advance in another direction. For it may be possible in the future of medicine to find an antitoxin for every infectious disease; and just as diphtheria to-day has been robbed of its terrors by the antitoxins prepared from its germs, so the future of medicine may include in the armamentarium of the physician like substances which can be employed with exactitude to arrest and to cure the onset of the very ailments to whose widespread attack we owe so much of our modern mortality.

THE MAID OF NORWAY.

By A SASSENACH.

OT far from the north end of Loch Eck there is an old cemetery. Its walls are broken and crumbling. No new tenant has been brought to rest there for many a long day, and there is

there is no old family mausoleum mains a hallowed and awesome spot to the fisher-

crofters of Strachur. Its headstones are moss-grown and broken, and the rank grasses and weeds are swallowing them up; but there linger around it many memories and legends, and Donald believes them all—or, at any rate, with the true poetic instinct of his race, he tells them as though he believed.

Donald says she was buried there. She floated

up Loch Fyne upon the tide, and the fishermen caught her up in their nets and carried her to the cemetery and buried her. There used to be a rough headstone with the inscription, 'Maighdean na Lochlin,' by which was meant 'The Maid of Norway,' over the grave; but it is gone now. Even Donald does not explain how they knew who she was, and perhaps the legend might have died or ceased to be believed if Moira, the wise widow of Strath Cur, had not seen and spoken to her herself.

It was late in April when the Sassenach walked up with Donald from the Cur in the gray-green light of a dull spring gloaming. The cemetery lay in deep shadow, and even the hills across the valley to the east were growing dark as a wet mist came up out of Loch Fyne. Donald had a few ewes on the hill; and as he lived all alone on his little croft, he seemed never to be in bed at this time of year. There was always a lamb expected hourly, and Donald tended his flock as a mother would her children.

'I thought I might have seen her myself last night,' said Donald. 'I passed by here just after midnight, and I waited for her; but it was an ill night for a lass to be abroad, so maybe she would lie still. But it must have been on much such a night that old Moira saw her. Moira was a widow, with only her little orphan grandson Hamish to help her, and he was too young to help at the lambing. So Moira was out late attending to her ewes just as I was. An old, childless man or a widow woman is a lonely wight; and it is in the spring and at the lambing that my loneliness comes home to me. Not that the ewes are not companionable creatures; and, after all, there is no friend like an old dog.'

Colin, the old gray collie, with his head stretched out along his paws as he lay at his master's feet, turned up his deep-brown eyes, and that was all-

they only needed to look at one another.

But it is we that live alone that learn not to be afraid,' Donald went on again in his dreamy monologue. 'It is the young man leaving his warm hearth and his wife and children all so full of life who is afraid. Life holds so much for him that he fears death, and fears to behold the dead. Surrounded with living human voices, he is deaf to the voices of "the spirits of the dead."'

The Sassenach knew that Donald would probably come to the point soon, so he let him

ramble on.

'I have always hoped that I might see her,' said Donald. 'They say that only those who believe can see, and I have always believed; but I do not see her though I have often waited and expected her. Perhaps that is why. Moira only came to look after the ewes; but she was not afraid. People always said Moira was so brave to speak to her; but though I never saw a ghost, yet I do not see why they should frighten me if I saw them. Moira only sat here and watched and waited, listening for her ewe bleating in the night. She saw the graves all open,

and the ghosts drifting away silently down the lochside or up the valleys where the clansmen lived in the old days. Then they all came trooping back and glided down into their graves, which closed over them again; but one still remained open. Moirs felt the rustle of little wavering gusts and the shivering among the grasses that tell of the coming of dawn long before any light shows in the sky, and she thought that that wandering ghost must soon come home. She laid her staff across the open grave, for she knew that a ghost cannot go into its grave if anything is lying across it, and she wanted to know who that wandering ghost might be.

Then it came hurrying up from the sea, and Moira was glad, because it was only a young girl, very beautiful, all flowing white, and with brightgold hair and pale-blue eyes full of life; but, oh! so tired—the Maid of Norway just as they brought her up out of the sea. But Moira was not afraid.'

The wind came in a cold gust out of the mist, and whined in the trees behind. The Sassenach shivered with a little eerie feeling; but Donald never noticed, and went on.

'The young girl came drifting quickly to her place, but she saw the staff and she looked at the old woman. She could not speak, because, of course, a ghost can only speak after it has been spoken to. She only looked and sat down upon the grass.

'Moira meant to speak to the ghost, whoever it was, and it was very easy to speak to the poor, tired young girl, so Moira asked her why she was so late of coming back. Then the young girl spoke in the still voice of the dead: "Oh, I have so far to go! The others can go up into the valleys where the crofts were, and all their friends are there where they used to live. But they do not speak to me, though I know that some of them brought me up here out of the sea. My friends, and my father, and all my people are away in Norway, and it is a long way to go."

Then Moira knew that this must be the Maid of

"You see," the girl went on, "I was bathing in the sea on the shores of Norway, far away in the north, with my maidens, and I was carried away by the tide, and so I was drowned; and none ever knew where I was until they were all dead, and then it did not matter, because I can go to them, and I can see my father, who was the king, and all my friends, though my body lies here." And the poor lonely ghost looked so tired that Moira was sorry, and the ghost knew it, and said, "Now, you will take away your staff, because you are kind, and you would not torment a poor shiftless ghost."

'So Moira took away the staff, and the young girl glided down into the grave. But before it closed she stopped and said to Moira, "You are a brave woman. You have not been afraid, and you have been kind, so I will tell you how you may find that which is more than a great treasure. You will go down to the loch in the morning, and there search among the pebbles, and you will find 8

round green stone with a hole in it, like a ring. Bring it back and put it on the finger of your little gandson Hamish, and he will have the second-sgh, and he will grow to be a seer." How could see have known that Moira had a grandson called Hamish? But the grave had closed, and the ghost was gone, so Moira went home and slept.

'So you see,' said Donald, 'we know that it was true, that old story about the Maid of Norway. And if we did not believe what Moira told, there was the stone which she found, and little Hamish thought it was a pretty toy, and wore it on his fager. He grew up so strange—always alone, yet never lonely. He was the friend of all the sheep and the cattle, and even the birds and the wild der, and he had the second-sight, and was a seer, just as the Maid of Norway had foretold.'

Donald is not a mere ignorant crofter. He knows his folklore, he has read his country's history, and he has travelled. Was he not in Edinburgh more than forty years ago, as a volunteer at the great review? But he tells his tale as a true believer.

'Is Hamish still alive, then?' said the Sassenach in his horribly matter-of-fact and incredulous way.

But Donald is patient. 'No, he is not alive; but my father knew Hamish, and he had the second-sight, and also I have heard that story from several ministers and respectable persons.' There was a delightful twinkle in his eye as he gave his authority.

The gift of prophecy, of course, died with Hamish; he could not hand it down to descendants, because, as everybody knows, many boys have second-sight; but the first time that they are touched by the love of woman, then they are for ever shut out from the realms of spirit in which the seer's soul lives. That is why most people who have the faculty are women.

THE TARPON AND THE GIANT SEA-RAY IN THE WESTERN PACIFIC.

OME American writers on tarponfishing assert that the monstrous herring is peculiar to the waters of Florida, or at least is not found anywhere except on the Florida coast and the Gulf of Mozine and

coast and the Gulf of Mexico; and caphasis was laid upon the 'fact' that the fish was minown in the Pacific. This is an injustice to the mighty leaper, for the tarpon is well known in the Western Pacific, as well as at Jamaica and San Domingo. If the present writer is not mistaken, the famous Italian naturalist D'Albertis was about the first person to note its presence in the estuaries of the great rivers of New Guinea which debouch into the Gulf of Papua. And, furthermore, tarpon of great size are taken by the natives of the Entrecasteaux Archipelago and the Louisiades, E the south-west end of New Guinea. Then, too, ber abound in the narrow Princess Marianne Nait, which divides the great Frederick Henry land from the Dutch mainland of New Guinea (vestern side). Here also may be seen perhaps the largest specimens of the gigantic sea-ray or 'devilin the world. Like the tarpon, they are laters, and seem to take an unholy pleasure in tenting their weird gymnastics at night-time, esecially during a calm, and when a heavy downall of rain accompanied by electric disturbance is bothcoming. It is a truly appalling sight to see the of these hideous and dangerous monsters sudbally lift itself out of the sea with its normally ridely expanded wings—twenty feet from tip to p-curred into umbrella shape, with torrents of on pouring from the black dome, and then spread on as flat as a carpet as the ugly and terrifying tradure falls upon the surface with a report that

sounds like a cannon-shot, and can be heard miles away.

The late Dr J. S. Kubary, a famous German scientist who spent many laborious years in the islands of the western and north-western Pacific, and whose investigations into their flora and fauna have enriched the scientific world, had a theory regarding this matter of the 'leaping' habit of the giant sea-ray. He had had several 'devil-fish' disembowelled (after they had been killed by dynamite charges in Princess Marianne Channel, if I remember correctly), and found in each fish pieces of tarpon, partly digested, which were of large size. Kubary's theory was that the giant sea-ray's acrobatic performances were not executed from mere 'devilry,' but as a means of seizing his prey-the tarpon and fish of its kind-which at night-time swim or rest within a few feet of the surface. And the huge sea-ray, being a slow swimmer, is provided with enormous protruding eyes that enable him to see not only far ahead but to port and starboard. Then, when he discerns his prey, he folds his great wings, leaps out of the water, descends upon his victim with stunning effect, and envelops it in a deadly grip.

Kubary's theory may be correct, for the natives of the Gilbert and Kingsmill Islands (Equatorial Pacific), who capture the sea-ray for the sake of the oil obtained from its liver, assert that it attacks and devours a fish called the pala, which attains a length of five to six feet, and is the largest and most voracious of all the deep-sea gars. The writer once harpooned from a whaleboat and killed two large rays at one of the Caroline Islands, and towed them alongside his vessel, where they were hoisted on deck and cut open. One contained a

number of mullet and the partly digested remains cr some large crabs; the other, besides fish, had the remains of three or four small soft-shell turtle, weighing from six to ten pounds. The presence of the crabs somewhat puzzled me, for they were not a deepsea variety of the crustacean, but had their habitat inside the barrier-reef of this particular island of Ascension (or Ponapé, as it is more generally called), where they fed upon the beds of sea-grass growing in shallow water. In the day-time they rest in hiding in the grass or seek the mud of the mangroveflats, but at night are easily caught by means of spears and torches. The natives, however, told me that very often the sea-haunting 'devil-fish' will at night-time come into the shallow water inside the barrier-reefs at high tide (especially when the sea is rough outside) and gorge themselves upon crabs and crayfish. I may mention that one of these horrible creatures weighed nearly three-quarters of a ton, and after being struck with the harpoon, towed the whaleboat for nearly two miles before we could haul up to it and give it the lance.

This evil-looking ranger of the seas is known to the natives of the Ellica and Tokelau Groups (South Pacific Ocean) as the oso 'oso—that is, the leaper. Some of the traders in the Polynesian Islands call it the 'jumping shark,' and in a letter of the writer's to the late Earl of Pembroke (who was always interested in the natural history of the South Seas, that he loved so well) it was

carelessly mentioned as the 'jumping shark.' Lord Pembroke wrote: 'What is the oso oso? Sir William Flower was discussing the subject with me. . . H2 thinks you mean the great ray, or some beast of that species. Send us a rough drawing.' The rough outline of the fish was sent, and with it an account of a tragic incident that occurred outside the reef of Nukulaelae Island (Ellice Group) in June 1866, the details of which were narrated by an eye-witness to a Major Sterndale, the author of a valuable but now forgotten series of articles on South Sea subjects, entitled 'My Wanderings and Researches in the South Pacific.' Sterndale himself told me the story. One dark, calm night several canoes were out catching flying-fish. A sudden rain-squall came on, and the torches of dried coco-nut leaf were temporarily extinguished. As the canoes were quietly floating upon the rainbeaten water there came 'a great upheaval in their midst, and an enormous oso 'oso leapt in the air, and then fell upon one of the canoes, in which were three men.' Only one arose to the surface with the wreckage of the canoe; the two others had gone to their death in that awful embrace or had been stunned and drowned.

This monster, so dreaded, is well known to the Mexicans of Lower California as the mania (or blanket-fish), and in the Gulf of Panama it is called marrayo, which, I imagine is an analogous

term.

THE MONTH: SCIENCE AND ARTS.

BIRDS AND THE MAN.

VERY remarkable work has been in progress for the last seventeen years under the direction of Professor Beal, who has charge of the division of Economic Ornithology of the Bio-

logical Survey, United States Department of Agriculture at Washington (D.C.). This is no less than an accurate determination of the amount of benefit or harm done to man by the various wild birds which share the land with him. During this period the professor and his assistants have microscopically examined the contents of the stomachs of sixty thousand birds to see exactly what they had eaten. It must be remembered that thousands of tiny insects and grubs had to be recognised by such infinitesimal things as their hairs or scales, for naturally they were not found whole in the stomachs of their captors. For the same reason fruits had to be identified by fragments of seeds, while wheat and other grain were sometimes only discovered by the shape of the starch granules. By most laborious tabulation and examination of the results, it at length became possible to say just how much good or harm, or just what proportion of both, is wrought by all the kinds of birds found

upon a farm or plantation. Those which do good—and there are very many of them—by feeding upon harmful insects, or 'contrariwise' by devouring the parasites which worry the beneficial insects, may be left unmolested or even actively encouraged by the farmer. The gentleman with the gun and the insatiable desire to shoot every feathered thing he sees is robbed of his last excuse for indiscriminate slaughter. Ready to his hand is a list of all birds whose killing is justifiable, with the true amount of its evil-doing debited to each.

BIRDS AND THE WOMAN.

At a recent conference of the Royal Society for the Protection of Birds, allusion was made to the trade-lie by which women are induced to purchase the plumes of birds under the assurance that they are artificial. So much has been said and written about the iniquity of exterminating whole races of tropical birds in order to decorate the heads of civilised women that the traders have adopted this ruse to calm the consciences of their customers. But it is amusing to note the application of the lie. Some houses adopt the attitude that the feathers could not be so cheap unless they were artificial, while others remark that they are expensive because of the immense amount of hand-

work; real plumes would be much cheaper. Upon examination by the British Museum, all the so-called artificial feathers were proved to be the nesting plumage of egrets and herons. On the trade being challenged to produce the name and address of a single manufacturer of artificial feathers, no response was forthcoming, and one enterprising gentleman offered one hundred pounds to any person who would take him to a factory of the kind, but no one accepted the offer. By the way, it is presumably illegal to sell artificial imitations of anything as the genuine article. Could it not be found equally a transgression of the law to sell feathers as false when really they are real?

RAILWAYS OF TO-DAY.

If it were possible for an ordinary civilised human being-similar to the familiar 'man in the street,' but without cognisance of railway trains to be addenly introduced for the first time to presentday railway traffic, he would marvel at many things. After his first wonderment at the ubiquity of the milroad and the speed and comfort of the trains, he perhaps would be most impressed by the simple cradity of many of the arrangements which we have inherited from the earliest systems unnoticed and anquestioned. In a land where every lift-door is guarded, every tower fenced in lest giddiness overtake a man, he would be astounded to see long platforms crowded with people while express trains dash past on either side, with no precaution whatever but a whistle from the engine and perhaps a varning shout from a porter or two. He would be surprised and amused to hear that the railway carriages were modelled upon the stage-coach of eventy years ago, and that they retain that form to the present day in spite of numerous unpleasant happenings; and that the railway gauge—obviously too marrow for eafety or comfort in present-day highed travelling—is merely a survival from the time when the builder of the first engine measured the ule of an old road-cart and followed that! He would wonder more if he were told that a train thanding in a station is only protected against mother train dashing into the rear of it by visual signals which may easily be misread or missed abgether. He might pass without comment the damey and dangerous method of coupling carriages; but he could hardly help astonishment the almost childish system of signalling by emaphore-arms and coloured lamps, knowing, as be much that the establishment of infallible comnunication between signalman and engine-driver would be a very simple problem to the electrician. Experiments have been successfully tried in conrening by wireless telegraphy between two trains tarelling in opposite directions, and a proposal s on foot to install the system for the use of Pasengera It would be, indeed, a strange anoaly if the passengers in an express train were begiving their possibly frivolous messages by the start means which science can devise while the

driver, on whom their very lives depend, was peering into the mist or darkness for a simple sign that his road was clear before him.

RAILROAD COLLISIONS.

The apparently excellent suggestion has been made that every train should be isolated directly it comes to rest at a station by the immediate movement of switches before and behind cutting it off from the main line. Then any moving train, whether running wild or not, must of necessity pass to one side, and, regaining the line beyond, have plenty of time to expend its momentum harmlessly. This was written in an American paper and apropos of American railways, but it is equally applicable to Britain. Had such a rule been in force here, two out of the three recent terrible disasters probably would not have occurred. At Grantham the train which was out of control would have passed on to the straight main line instead of on to a sharp curve not intended for high speed; and at Arbroath the returning train which missed the signals would have passed around instead of into the standing carriages at Elliot Junction. It is noteworthy in this connection that, even with the simple appliances at present at command, that last terrible catastrophe might have been averted if it had been the rule to place fog-signals in front and at the rear of standing trains whenever the weather is thick enough to make head and tail lights untrustworthy. But it is quite time that the whole antiquated system of signalling by semaphores and fog-detonators was superseded by something more in keeping with present-day requirements and more in line with the capabilities of modern science. On the Boston and New York City subways there is an apparatus in use which comprises an automatic block system of the type adopted by the Pennsylvania and a number of other railways, but with the addition of a short inclined plane alongside the track at the entrance to the block. This is interlocked by the mechanism which lights the red lamp at the entrance to the block whenever it is occupied by a train. The plane, when raised, touches a lever which depends from the second train, and this lever in turn applies the air-brake, bringing the second train to a standstill. Hence an engine-driver cannot run past the danger-signal. This device is reported to be perfectly successful in operation, and is regarded as an absolute protection against the admission of a second train to the block already occupied.

THE CARE OF STORAGE BATTERIES.

Electric accumulators, or storage batteries, as they are somewhat ambiguously called, are generally voted a nuisance whether they form part of the equipment of a large central station or merely an accessory to a small system for lighting a private house. A cell will fall 'sick' from a very little cause, and the disease is often not discovered until it has gone too far to be cured, with the result

that the cell is ruined and the life of the whole battery endangered. But all the illnesses to which a cell is heir have their signs and symptoms by which they may be recognised in time by a vigilant attendant if he have the knowledge. Here has hitherto been the difficulty, for the knowledge has generally been attainable only in the hard school of bitter experience, whose lessons, though well taught, take long to learn. A book which tells all that a battery-user should know has been written by R. W. Vicarey, and published by The Electric Accumulator, 15 Cheapside, London. It is written in a way which is convincing more from its internal evidence of thorough knowledge than from its literary style. The treatment of the subject is very complete, and is all the better for being free from the useless encumbrance of unnecessary information which is so often found in works of the kind. Where necessary, the text is elucidated by clear and intelligible diagrams, and the book is completed by some useful tables and a glossary of technical terms. It is heartily recommended to the careful attention of all who have to do with accumulators.

THE LUSOL LAMP.

Mankind persistently refuses to follow the sage advice of Dr Silvanus Thompson, and, by conducting its business and pleasure during daylight hours, make use of the cheapest of all illuminants. Hence it is one of the problems of the day, or rather of the night, to procure the maximum amount of light with the least expenditure of energy-which means money. When we learn the secrets of the glowworm and the fire-fly we shall be able to make light without heat, and save at once some 90 per cent. of energy; but in the meantime every improvement in our present methods is a distinct gain. A big step in advance may be looked for in the new lusol lamp, which appears to be the most economical light-producer at present at man's disposal; for, light for light, its cost is said to be only a quarter that of the next cheapest illuminant. An article dealing with this lamp, under the heading, 'A New Illuminant,' appeared in Chambers's Journal, 1906, p. 718. Lusol is an impure benzine obtained by the distillation of coal-tar. The lamp is a device for vaporising this volatile hydrocarbon, and burning the vapour mixed with air around an incandescent mantle of the usual type. The lusol is sucked up from the body of the lamp by a wick tightly packed in a closed tube having a single tiny orifice at the upper end. The mantle is hung upon a heavy copper support which is in metallic connection with the top of the tube. This support gets very hot while the lamp is burning, and part of the heat finds its way by conduction to the tube containing the wick saturated with lusol. The fluid is vaporised by the heat, and the gas escaping through the little orifice is mixed with a suitable proportion of air, and, burning, keeps the mantle in brilliant incandescence. It will be seen

that the action requires starting in the first place, and this is accomplished by burning a little pellet of cotton wool soaked in spirit in a position to heat the mantle-support and kindle the vaporiser. In a little while the lamp is in full swing, and will then burn for any number of hours only limited by the capacity of the reservoir of lusol. According to the Scientific American, the new lamp, which is the invention of Mr Louis Denayrouze, should have a great future before it. The obvious objections to its use are the volatile and therefore dangerous character of the lusol and the slight trouble and delay involved in lighting the lamp. But there are dangers of sorts with all forms of artificial illuminants; and extreme cheapness, when proved, may cover many minor defects.

SOAP FROM PETROLEUM.

A successful demonstration of a new process for the manufacture of high-grade soap by the saponification of petroleum was recently given in London. According to the owners of the process, the saponification of petroleum has been sought for many years by the most eminent chemists without success. In the process invented by MM. Lothammer and Trocquenet, 3 per cent of an aqueous extract of Panamá wood was gradually added to a quantity of rather heavy petroleum, and thoroughly incorporated with an egg-beater. The mixture slowly assumed a very much lighter hue and took on the consistency of butter. It was then added to a similar quantity of palm-oil and cooked for some hours, during which time the soda-lye was added little by little. The result was an excellent soap, which is said to offer numerous advantages. It is lighter in weight, bulk for bulk, than primrose, Castile, or other good household soaps, and it is odourless, antiseptic, less wasteful, and cheaper to produce than other soaps of similar quality. It is not inflammable.

A TELESCOPE IN THE WAISTCOAT-POCKET.

A simple little device called the 'Unilens,' and credited to Major Baden Powell, F.R.A.S., should prove itself useful in a great many ways. It consists of a single lens mounted in a simple metal ring, to which a little clip is attached. By means of this clip the lens, which is of convex form and two and a half inches in diameter, can be instantly fixed to the end of a walking-stick or umbrella. Held in this manner at the most convenient distance from the eye, the little glass performs the functions of a small telescope or simple fieldglass, lending to distant objects a magnification of about four diameters. There are numberless uses to which the little contrivance can be put, such as the examination of details of architecture beyond the easy reach of unassisted vision. In all those many instances where one would like to have a field-glass but cannot be bothered to carry one, the Unilens should come in handy. It is even suggested that it can take the place of opera-glasses at the theatre; but the prospect of an auditorium in which every spectator was using a Unilens at the end of his umbrella may be left to the imaginations of the artists of Punch.

AN ELECTRIC FILTER.

It is reported that a Hungarian engineer has invented and exhibited a new electric filter for which powerful germicide properties are claimed. Water in passing through this instrument will be subjected to two distinct processes. In the first place, a powerful current of electricity will be passed through it, by which it is believed all micro-organisms will be killed; and afterwards it will undergo ordinary mechanical filtration for the removal of all suspended matter. Pure water free from saline matter is not a conductor of electricity except at very high potential, so that the new invention will hardly be applicable to the requirements of ordinary households; and it has not yet been geneally proved that an electric current, even under sufficient pressure to force it through water, is necessarily inimical to all forms of bacterial life. When it has been shown that the living organism a really capable of happy despatch by electrocution, it will remain to show that the spores are also destroyed, or its descendants may afterwards come to life and work their will. The new filter is promised exhaustive trials at the St Petersburg hospitals and laboratories, so that all doubts on these points should soon be set at rest.

THE BIRTH OF THE FLYING-MACHINE. Referring to the excitement caused in Europe by the short flights of the Santos Dumont aeroplane, the Scientific American calls attention to the earlier whierement of the brothers Wright of Drayton (Ohio). Owing, it would seem, to the unusual modesty of these aeronauts, who refused to allow actes to their machine or to furnish any particulars u to its details, the stories of its wonderful achieve-Bents received but scant credence in Europe. But arefully conducted inquiries in America left no hom for doubt; and lately the journal in question rs accorded an interview, and has published full Articulars. The inventors commenced experimenting with the duplex aeroplane—like a huge boxtie without the string—and became remarkably Proficient in gliding from slight eminences and stering the machine through intricate courses before it alighted. Then they began to think of adding the motor and propellers to make the big kite selfpropulsive. In the absence of authorities, they had to work out for themselves all problems as to size, thape, and speed of propellers, and many other things. In the end they accomplished a successful continuous flight of over twenty miles at a high ped and with perfect control! They are now building a motor with which to drive their new and larger acroplane, and they expect to accomplish to uninterrupted flight of five hundred miles at an strage speed of fifty miles an hour. Our contem-

porary—which is not given to giddy enthusiasms seems to believe they will succeed. If they do, the feat will not this time pass unrecorded in the annals of aerial navigation.

SUCTION GAS-PLANTS.

The report of Captain Sankey, R.E., on suction gas-plants exhibited at the Royal Show at Derby last year has been issued by the Royal Agricultural Society of England. Amongst exhibitors were the National Gas-Engine Company (Ashton-under-Lyne), Crossleys (of Manchester), and the Campbell Gas-Engine Co. (of Halifax). Professor Stanfield of Edinburgh, in a report made for the Highland and Agricultural Society of Scotland in 1905, concluded that the economy and workability of the suction gas-producer had been fully demonstrated. It is expected that suction gas-plants will replace portable steam-engines in time; less manual care is required, and there is greater economy of fuel than in either a steam or oil engine. A traction gas-plant is being asked for, and one that can use bituminous coal. As long ago as 1861 Sir William Siemens introduced producer-gas for steel-smelting; but it was Messrs Crossley who, in 1901, made the first suction gas-plant. The Dowson Company exhibited a plant two years later. Producer-gas has a much lower heatingpower than town gas, and has no illuminating power. It is formed when a mixture of air and steam is made to pass through a bed of glowing coke. Producer-gas may be made by forcibly blowing the necessary air and steam through the coke in the retort, or the engine itself may by virtue of its suction-stroke draw the necessary air and steam through the mass of incandescent coke. In the first case, pressure producer-plant is the name given to the system of gas production. In the second case, when the engine draws the air and steam through the coke-bed in the performance of its cycle, it is a suction producer-gas plant.

HOW CANADA IS FILLING UP.

The Outlook, of New York, remarks that for the season of 1905-6 one hundred and eighty-nine thousand immigrants arrived in the Dominion, as compared with one hundred and forty-six thousand during the season of 1904-5. During the twelve months which ended on the 30th of September fifty thousand homesteaders went into western Canada and possessed themselves of twelve thousand five hundred square miles of farm-land. Winnipeg is the clearing-house for most of this Western immigration; and in these days, when the two hundred and fifty million acres of wheat-land in Canada are being so rapidly peopled by immigrants from Great Britain, from the United States, and from the older provinces of Canada, its position among the larger cities of the North American continent is unique. In the immigration season Winnipeg has a transient population of from seventeen to twenty thousand; while as a

result of the immigration of the last three or four years the city has now reached the hundred thousand class. Other Western cities are increasing in population from the same cause; but of all the Canadian cities Winnipeg is perhaps the best from which to form an idea of what the filling up of the wheat-area of the Dominion means in the way of development. In Winnipeg the increase in population has been so great that the municipal equipment of the city is in arrears, and extraordinary exertions and large outlays are now being made to bring the water-supply, the sewerage system, and the street department up to the needs of the city. Even the railway companies, which are usually supposed to look far ahead, have found themselves behind-hand and not quite ready for all the business-passenger and freight-which the rapid development of the prairie country is bringing to them. The new station of the Canadian Pacific Railway Company at Winnipeg is, as a station, almost as magnificent as Broad Street Station, Philadelphia. It was opened before it was fully complete; it has already been found too small, and the building of an annex is now to go on side by side with the completion of the main station. East of the city of Ottawa there is only a single track of rails; but the handling of the increasing grain crops-for the Canadian West now raises eighty-five million bushels—has rendered necessary the double-tracking of the four hundred miles of railway which lie between Winnipeg and Fort William, where most of the grain is transferred from cars to steamers for conveyance down the Great Lakes to Canadian and American ports. At the annual convention of the Canadian Manufacturers' Association at Winnipeg, the association decided to begin a propaganda in Great Britain in the interest of the factories and workshops of the Dominion. This because the Government hitherto has only used propaganda for settling people on the land.

PETROL, LIQUID FUEL, AND THE INTERNAL-COMBUSTION ENGINE.

To those who have fears that our stock of petrol may be exhausted by the daily increasing demand, the statement of Sir Marcus Samuel, a pioneer in the use of liquid fuel in the Shell Line of steamers, and interested in the oil-wells in Borneo, should be reassuring. The supply of petrol is unlimited. The export of benzine or petrol from Borneo and Sumatra during this year will amount to about two hundred thousand tons. His firm has almost a virgin territory in Borneo which was producing fourteen thousand tons per week of crude petroleum, some four or five thousand tons of which they had to destroy, owing to the lack of a market. They had ceased boring in their territory, which extends for sixty miles, as the supply was so great that they had not means to cope with it. Besides Sumatra, Mexico also affords a supply. It seems likely that had Sir Marcus Samuel, as chairman

of the Shell Transport and Trading Company, not demonstrated the possibility of transporting petrol in bulk with perfect safety, motor traffic would never have assumed its present proportions, for cost would have been prohibitive. The first cargo of petrol in bulk, four thousand two hundred tons, was imported from Borneo in the Shell Line steamer Murex. It now comes in cargoes of eight thousand five hundred tons by the same line, vid the Cape, as the directors of the Suez Canal disallow its transport by Suez. Petrol is imported as benzine, the natural spirit of petroleum, which comes off at the first distillation; the next yield is kerosene, used as lamp-oil. The balance of what is left is used as liquid fuel, which can be procured from Texas and at all ports east of the Suez Canal. It has to be atomised by steam or air before combustion is secured, and is perfectly safe, as if a lighted torch were put into a bucket of liquid fuel it would be extinguished. After ten years' use of liquid fuel, the experience of Sir Marcus Samuel's firm was that the wear and tear of boilers is lessened as compared with the use of coal, it does not soot-up the tubes, and the decks are cleaner. Sir Marcus, as President of the Institute of Marine Engineers, recommended engineers to make themselves masters of the construction and working of internal combustion engines, which need no boilers and use fuel which is cleaner than coal and is easily handled.

A TOAST.

FLASH out the wine, and let it shine Deep down within the glass; No measure thin, fill to the brim Ere we the flagon pass. A glass of wine 'For Auld Langsyne.'

Touch glass with mine, and let them chime-A chime of cheerful lays; Touch rim with heel, and let them peal A song of youthful days. Touch glass with mine · For Auld Langsyne.'

My hand in thine, thy hand in mine; Though summers die and roses fade, Though vines are wither'd and decay'd, Yet friendship lasts, remains the wine And fragrance born of sunny clime, Old friend of mine,

' For Auld Langsyne.' HERBERT J. B. STAVERT.

1st. All communications should be addressed 'To the Editor, 339 High Street, Edinburgh.'

2nd. For its return in case of ineligibility, postage-stamps should accompany every manuscript.

3rd. To secure their safe return if ineligible, ALL MANU-SCRIPTS, whether accompanied by a letter of advice or otherwise, should have the writer's Name and Address pritten upon them. written upon them IN FULL.

4th. Poetical contributions should invariably be accompanied by a stamped and directed envelope.

AN P E NDOOR.

A STORY OF TO-DAY.

CHAPTER I. -- IN THE FAR EAST.

a town of the Far East-that comprehensive term which embraces such widely differing regions as the ice-bound harbour of Vladivostok and the palm-fringed shores of

Penang - the English community was in great trouble for want of a clergyman. Not that it was a particularly religious community lar from it; a more worldly set it would have been difficult to find. But the men and women who composed it had their ideas as to what was right, and they liked to contribute towards the stipend of a 'parson;' they liked to know that there was a service on Sunday morning, even though they did not to it; and, above all, they liked to know that there was some one at hand to conduct the burial service or to christen a baby.

and for many years these wishes had been gratihed. The clergyman resident at Satong was a mild hitle man, who preached the quietest of sermons; he was anything but a militant priest, and had given way before the strong tide of worldliness, as being anable to stem it. He rarely said anything that roused the conscience, and there were those among the congregation who sighed for something more spiritual, more bracing; who longed for the dengman to hold up a high ideal and raise them. But there seemed little chance of a change.

Suddenly one morning the community was thrtied by the news that the parson was dead. There was a hurriedly called meeting of the churchwardens, and the question on every lip was, 'Who is to read the burial service?' There was no time to and for the missionary resident up-country, and it vs clear that some one must brace himself for the tak A general consensus of opinion pointed to Mr Scott, a churchwarden and one of the oldest remients of Satong. Mr Scott did not at all like the duty; but there seemed no escaping from it, and he unwillingly agreed.

Confound it Carrie!' he said that evening to his

wife, 'I never knew what it was to be nervous before. I thought I was nervous the day I married you, my dear, but it was nothing to this. There was the clergyman then to put me right if I went wrong; but this time, if I make mistakes, who will help me out? All I can say is that we must get a new man just as quickly as ever we can.'

When the funeral was over letters were despatched to the bishops of nearly every diocese in the Far East, representing that the English inhabitants of Satong were in great need of spiritual ministrations, and would be glad of even temporary help till a clergyman could be got to come from England.

Great hopes were placed on a bishop in whose diocese was a large military station. It was thought that he might be able to spare one of the army chaplains for a time.

In the course of a few weeks answers came dropping in. The bishop who was supposed to have army chaplains at his disposal begged to point out that the chaplains were departmental officers of Her Majesty's service, and no more under his orders than the majors or captains; and that, much as he regretted it, he was unable to help them. Missionary bishops wrote that the clergy of their dioceses were all working under societies at home, who appointed them to their stations, and without whose sanction it was impossible for them to leave their posts. It really seemed as if the whole of the great Far East was incapable of producing a clergyman.

Meanwhile the situation in Satong was becoming very strained. To judge by the commotion caused by his death, one would have thought that the whole life of the place centred round the quiet little parson. The Richardsons' baby became dangerously ill, and the mother wished to have it baptised. Who was to baptise it? Some people thought that the doctor was the proper person in a case of sickness, others said the parents of the infant. while some argued that as Mr Scott had read the

[All Rights Reserved.] MARCH 2, 1907. burial service, he might just as well 'do the other thing too.' There was an immense amount of discussion on the subject, but no one could produce any very conclusive argument; and considerable dissatisfaction was expressed with the Prayer-Book rubrics because they failed to give sufficient guidance.

Meanwhile the baby got better, to the relief not only of the parents but of the whole community.

CHAPTER II .- AN ARRIVAL.

WO Englishmen were lounging on the Satong pier watching the sampans as they came ashore from the mail-steamer.

'Great heavens, Brown!' exclaimed one of them suddenly, 'look at that sampan. What do you see in it?'

'I see a man,' replied his companion. 'What do you see in it to excite you?'

'A man!' shouted the other. 'A man! Can't you see that it is a parson—soft hat, collar, and all? Look! There, now!' in a triumphant tone of voice as the individual in question stepped on to the pier and was clearly visible.

'We can't let those sharks get hold of him. He's a new-comer; but I hope he has come to stay. I'll go and pull him through;' and so saying, the speaker walked up to the clergyman in question and offered his services in helping him through the Customs.

'The Scotts' house? It is quite near here,' he said in reply to a question. 'My name is Stuart; I am an old friend of the Scotts. My trap is waiting just round the corner. I hope you'll let me take you up. Luggage? Oh, don't bother about that; don't you give it a thought.—Look here, you'—this to a Chinese—'see that this gentleman's luggage is brought up. No mistake, now. Right up to Mr Scott's house.'

'Stop, stop!' said the new-comer, somewhat surprised at the cordiality of his welcome. 'The fact is that Mr Scott does not expect me, and it may not be convenient for them to have me, in which case I shall go to the hotel. Mrs Scott is a connection of mine; but as I was not sure of my movements, I did not write beforehand.'

'You bet they will be glad to see you,' was the rejoinder.

And in a few minutes Arthur Sidney found himself bowling along the Satong road. He was a student of faces, and so could not but notice that every European that passed gazed at him with an expression of keen interest. Ladies leant forward in their carriages to look at him, and it seemed as if he gave rise to considerable comment.

'I suppose they rarely see a stranger,' he thought. His companion rattled on with a good deal of information about the buildings they passed, interspersed with questions to Sidney on the subject of his travels.

'Going to stay till the next mail-steamer, are you? That will give you just a fortnight here; but perhaps the Scotts will be able to persuade you to stay on a bit. Not that there is anything to see in Satong. I can't honestly say that there is.'

When they drew up at the door of the Scotts' house his companion jumped out, and, asking Sidney to wait a moment, ran up the steps.

Mr and Mrs Scott were taking tea in the drawingroom when Mr Stuart burst in upon them.

'Cheer up, old Scottie!' he exclaimed. 'What do you think I have brought you? A real live parson. We'll have a fine turn-out, and christen the Richardsons' baby in style. He says he is only going to stay a fortnight, so I recommend putting up notices in the club that those who are thinking of dying are requested to do so within the next fortnight.'

'What are you talking about?' said Mrs Scott.
'I wish you would say what you mean. Where is there a real live parson, as you call him?'

'At your very own door, my dear lady, awaiting your cousinly embraces. He calls himself Arthur Sidney on his luggage.'

Mr and Mrs Scott rushed simultaneously to the door to prove the truth of this statement.

Sidney was touched at the warmth of his reception. The idea of a hotel was scouted, and he was at once established as a member of the household, 'for as long as you will stay, my dear fellow,' said Mr Scott.

'I believe the next boat goes in a fortnight,' said

'Much may happen in a fortnight,' was the somewhat oracular rejoinder.

CHAPTER III .- ARTHUR SIDNEY.

RTHUR SIDNEY was a man of good family; and had he chosen, on leaving the university, he might have taken up a diplomatic life with a good chance of

a brilliant career. But his was one of those deeply religious natures that are from youth absorbed in a love of humanity and a longing for self-sacrifice. He never wavered in his determination to enter the Church. His rare qualities of heart and head were not unnoticed at the university, and when he was ordained he was beset with offers of curacies. It was typical of the man that the country livings and the West End congregations had no attractions for him. He wanted to grapple with problems, to wage a fierce warfare against sin and drink; he wanted to be the friend of the working-man. His mind was filled with visions, but they were all visions of different forms of work and of more complete and absolute self-sacrifice.

Being of a highly artistic temperament, he threw himself with great vigour into the perfecting of the Church services, and his church became a source of pleasure to many. But the work he loved best was that which led him among the poor, with whom he was paticularly popular. He was of a sympathetic nature, and their grievances—at times their fancied grievances—called forth in him the warm indignation felt by youth.

Not long after he had taken holy orders, Sidney beame engaged to a very charming girl, Ethel Biren. Hers, too, was a strenuous nature, and all their castles in the air included great plans for the improvement of the 'masses' and the uplifting of the down-trodden.

They were young and brilliant, and had suffident money to make starts in the schemes that aggested themselves, so that naturally there were many calls made on their sympathies. But no one can make the demands that Sidney did upon his mind and body without at some time feeling the train; and just on the eve of his marriage he had a scrious nervous breakdown, which resulted in singent doctor's orders to take one year's complete rest. As his father was willing to provide the funds, Sidney determined to make a journey round the world. Mr Rivers would not allow his daughter to go off on such a long tour, so the marriage was postponed, and Sidney set out alone. The doctors had recommended his spending the greater part of the time in the bracing air of the Rockies, which he accordingly did; and then, crossing to Japan, he had saved there a couple of months. Hearing that he ould get a steamer straight to Satong, he had thought that it would be pleasant again to see some relations, and so he found himself landing at the

It was not until the evening that Sidney gradually began to understand the situation, and to precive that the hearty welcomes he had received were not all owing to joy at seeing Arthur Sidney, the thiefly owing to his being what they wanted—a dergman.

Would be baptise a child and take a service on Sanday morning? he was asked, and he expressed prict willingness to comply with both requests.

Thank goodness! said Mrs Scott, 'the church iells can again be rung. It has seemed quite weird to hear them on Sundays. I can't tell you two grateful we all are, Arthur, and I do hope we as persuade you to stay a little longer. Do take

The English community in Satong were deterained that Sidney should have nothing to complain of with regard to a congregation, and when Sunday bearing came the church was extraordinarily

'Never seen it so full except for marriages or instrala,' said Mr Scott as he peeped out of the

Sidney being his own relative, Mr Scott felt very repossible, and was quite nervous until the sermon varvell on. But he need have had no fears as to Sidary's powers of preaching. A really devotional an with a fine voice cannot fail to make his mark

as a preacher, and the Satong people knew that the Christianity then preached to them was a living power, not a formula.

CHAPTER IV .- "YOU 'LL STAY."

HE next morning an influential deputation from the congregation called on Sidney and earnestly begged him to stay more than a fortnight at Satong. They represented that the answers to their letters ought to arrive in about two months, allowing for a couple of weeks to elapse while inquiries were made in

sented that the answers to their letters ought to arrive in about two months, allowing for a couple of weeks to elapse while inquiries were made in England. They said that, of course, they could not venture to ask him to stay till the new clergyman came; but would he not consent to help them, say for two months?

Sidney was completely taken aback, the whole thing was so very unexpected. He did not know at first what to answer, and said that he must first consult a doctor; for, as he was travelling for his health, he must consider that in his decision.

The doctor was called in, and on hearing the case gave it as his opinion that to stay in Satong could not possibly hurt Sidney.

'Overwork and a nervous breakdown, with complete mental rest ordered? Well, my dear sir, you'll find it difficult to get anything to work your brain on in Satong. It's just that that plays the devil with people out here; nothing to think about, and so they get into mischief. I don't suppose that a sermon, which need not be more than ten minutes, on Sunday morning can count as much to a man like you. Come now, just decide to vegetate here for the next two months. It will do you good.'

And so Sidney pledged himself to two months more at Satong.

The news spread like wildfire, and when, next morning, he walked down with Mr Scott to his office he was accosted on all sides with expressions of pleasure.

'Oh, Padre!' exclaimed one little lady, rushing up to him, 'I can't tell you how glad we all are that you are going to stay. And look here, Padre, we are all going to turn over a new leaf, and come regularly to church.'

'Padre, indeed! How I dislike that kind of Anglo-Indian slang! I call it very bad form in a lady,' said Sidney as they passed on.

'Well, well,' laughed Mr Scott, 'I suppose no one would hold up Mrs Travers as the ideal of good form. But she is not a bad little creature, though my wife does say that she is going a bit too fast.'

Sidney was, of course, made a member of the tennis-court and the club, and soon knew all the Satong society. Many things that he saw and overheard filled him with horror. He had, of course, in his career as a curate in London met and fought with vice in gross forms; but it had been among the lower classes, among those whom he was plan-

ning for and trying to raise. The set to which he belonged by birth was a cultivated and religious one, and while at Oxford he had mixed with the serious set of men. At Satong he was brought face to face with vice in those whom he had to treat as equals, and it seemed to him much more horrible when the laws of society compelled him to be silent in its presence. He, of course, did not at once see to the full how much there was to demoralise the white man in the Far East; it was a gradual awakening, every week bringing some further saddening revelations.

'Why did you not come to the ball last night?' said a man to him one day in the club. 'Our last parson always looked in for a bit.'

Sidney drew himself up stiffly.

'Then I fear I cannot follow in his steps. I do not consider that the ballroom is the place for a clergyman'

The man looked at him steadily for a minute. 'Look here, Padre,' he said ; 'you have not been out long in the Far East. If you had you would speak differently. Why, good heavens, man!' he burst forth, 'can't you see what is going on around you? Where were Smith and Wentworth last night? Where were they? Not at the ball. You go and see the places they were at, and then come and tell me what you think. I am bound you'll be thankful to hear of a ball; you'll be going on your knees to ladies to give balls. If the young chaps here did nothing worse than go to a ball, and skip round with some girls, and drink a little champagne at supper, and go home to bed-if they did nothing worse than that, why, I should say that they were all making straight for heaven.'

And as the days went on Sidney was always seeing something to fill him with regret, if not with a holy indignation. He saw young Manners, whose people he knew well at home, come out of a gate

with a little boy dragging at his coat-tails, a little boy who was unmistakably Eurasian.

'Bad job that,' said Mr Scott as they drove past. 'Poor chap! he is a soft kind of fellow; said he could not endure living with a lot of men, so he went in for that style of living. He could not afford an English wife; these English girls expect such a lot. After all, marriage is a matter of what you can afford, not what you wish. No doubt he would have given anything to get some nice homegirl for a wife, but he would have had to wait till he was gray-headed before he had the money for that. And he was the kind of fellow that must have a woman about him. Funny how some men are like that, and others, on the contrary, think a woman fussing round nothing but a bore. Oh yes, he married the Chinese woman all straight at the Consulate. The Consul tried to put him off it, but it was no good. Of course he dropped out of society, though some of the ladies tried to go to see her; but what was the good? She has not an idea in her head beyond Manners, clothes, and food, and the children—and not many ideas about them, poor little things! Manners is fond of them, but in a shamefaced sort of way; he knows that they are not much to boast of. You see, there is no school for them to go to, and his wife cannot teach them nor dress them either, so they are a queer little set. He is a man who has pretty well wrecked his life, though he has done no wrong to any one.'

Sidney was soon on friendly terms with a good many of the young men. They would come to see him, and from talk of up-country sport would pass to more serious topics. Some of them seemed to feel that they were drifting, drifting, and wished for a strong influence to come and help them to shape their lives. And every talk wound up with 'You'll stay on, won't you?'

(To be continued.)

THE ENGINE-DRIVER.

By G. A. SEKON, Editor of The Railway Magazine.

Who is it looks with eyes so keen
At night to see lamps red and green,
And keep from dangers unforeseen?

The engine-driver.

HAT man has not been convinced at some period of his boyhood that the only career that has the slightest interest for him is that of a locomotive engine-driver? The intensity of this conviction, and its

duration, depend a good deal upon the temperament and worldly position of the boy; but whilst the conviction continues, the embryo engine-driver is more ambitious to drive a railway-engine than to surpass any of the feats of heroism, daring, or prowess known to him. The many famous deeds ascribed to names modern, ancient, or mythical sink into insignificance before the glamour of the engine-driver's life.

This fascination of the engine-driver's calling ever remains with many of us; and well it may, for 'the man on the foot-plate' often holds in the hollow of his hand, and for hours together, the destiny of hundreds of human beings; a moment's forgetfulness, inattention, or an error of judgment may result in the death of scores of men, women, and children. Although during the past few months disasters have happened at Salisbury, Grantham, and Arbroath that were apparently due to error or neglect on the part of the engine-drivers, yet such are the training and nerve of the men chosen to drive express trains that catastrophes resulting from neglect of duty are so infrequent that they need scarcely be taken into account; whilst the

ocasions when the alertness, decision, and heroism of the engine-driver have averted terrible carnage are perhance more frequent than many of us suspect.

We should be proud that the engine-driver is esentially a British product. In the early days of railwars, locomotives for foreign countries were built here, and drivers to work them were sent all over the world; consequently most of the drivers in France, India, Egypt, and our various colonies were British. Later, British drivers were to be found in Japan, and at the present time large numbers are amployed on the South American railways.

Originally the men who built the locomotives were thought to be the best men for driving the engine; hence many of the early engine-drivers were skilled mechanics, the rest being engineers' handy men'. It was, however, soon recognised that engine-driving and engine-building were totally different things—a man might be a good engine-fitter and a bad engine-driver, and vice versal; so that when the working of railways began to fall into recognised grooves, the manning of the engines as separated from the erection and repair of them; and although the same officer remains 'chief' of both sections, the enginemen now form what is known as the 'Running Department.'

Because the men are no longer trained as engacers it must not be supposed that they have no mechanical knowledge. As a class they are highly intelligent, and their training enables them to pick up and turn to account a deal of useful information regarding the anatomy of their charges; indeed, without this knowledge they could not for long remain 'knights of the foot-plate.' They are indeed triable 'handy men.'

A youth who determines to follow the occupation of an engine-driver will find the training long and aduous. Many are discouraged, and sooner or later gre up; others are found physically, or by temperament, unfit for the position; whilst others fail back the high standard of efficiency required of the securing the post of engine-driver.

Let us follow the career of a youth who possesses all the qualifications necessary to become an engine-tiver, and see what he has to go through before he can be a seen and it is placed in charge of a comotive at the head of a 'crack express.' The parties differs in details on the various railways; but the methods we are about to describe may be exerted as obtaining on most British lines.

Having made application to the foreman at the leal shed, and being of the right age and size, as well as physically fit, upon acceptance of his services the embryo engine-driver will commence duties as a various boy. This occupation is one likely to cool—if the Institute can be allowed—the ambition of the engine and taking out, cleaning, rearranging, when necessary, inserting new fire-bars. As the bars are of iron, and are somewhat lengthy if the fire-box has not thoroughly cooled, for should

a 'bar-boy' attempt to start work too soon after the fire has been withdrawn he is likely to get seriously burned. When inside the fire-box, he also has to clean out the tubes in the front tube-plate. He will continue work as a 'bar-boy' until he is about eighteen years old, unless he has previously grown too large to get through the aperture of the fire-box.

Now comes an important period in his career. He has to undergo a thorough medical examination, the eyesight-tests being particularly searching, especially that of the colour-tests. Perfect eyesight is most necessary, as an important part of an engine-driver's work consists in looking out for signals, &c.; whilst the instant and accurate reading of colours is most important, since, during the hours of darkness, the safety of the train depends upon the engineman's appreciation of the colours displayed by the signal-lights. Various colour-tests are employed, the examination being most searching, and rightly so; although some enginemen consider it more complex and scientific than the occasion demands.

Having successfully passed this ordeal, as well as an elementary educational examination, the bar-boy becomes a cleaner. The recruits of the cleaners' gang have not pleasant work to perform, having to scrape and polish the wheels, motions, &c. of engines that have been laid by for repairs, &c., but are about to be put into service again. After a time he will be promoted to clean the wheels, framing, side-rods, springs, and other parts of an engine and tender in service. This work will not be so dirty, because the engine is more frequently cleaned. Proficiency in wiping the under part of an engine enables the cleaner to take entire charge of a small tank or shunting engine, of which he has to clean the upper part as well as the lower portions. In this position the public has an opportunity of seeing his work, as the chimney, boiler, dome, safety-valves, and other fittings, the tanks, &c., are cleaned by the youth whose work we are describing. Being proficient, he is further promoted, and becomes a 'top-cleaner' of a main-line engine, with a 'wheel-boy' under him. He now has opportunities of enlarging his knowledge, for when the shed is short-handed he is required to assist at filling the boilers, washing them out, lighting the engine fires, &c. After he has been cleaning for about a couple of years, he will, when a vacancy occurs, be appointed a 'washer-out' or 'fire-lighter.' As the names imply, the former has to clean out the boilers of the engines on their respective shed days, whilst the work of the latter consists of lighting the engine fires and attending to them until the drivers and firemen come on duty; and woe betide the firelighter if he has not a fair head of steam and a good fire when the enginemen appear on the scene!

The time of the next upward step depends a good deal on the amount of traffic. If trade is brisk and goods traffic is plentiful, the best youths are told to prepare themselves for the fireman's examination. This notification is naturally received with con-

siderable gratification by those selected; and now comes an anxious time, for another eyesight and general medical examination must be successfully negotiated before the technical examination can be entered upon. This being got through with flying colours, the men are officially known as 'spare firemen.' On passenger lines the examinations for spare firemen usually take place annually, previous to the commencement of the excursion season, when, consequent upon the increase of passenger trains, there is a general moving up of men in the running department; in most cases, however, only to return to their previous position at the end of the holiday season.

Having been passed as a spare fireman, the firelighter or washer-out continues his usual avocation; but he lives in an atmosphere of pleasurable expectancy, his feelings being somewhat akin to those of a budding writer who has penned a communication, addressed it to the editor of a local journal, and awaits the issue of the publication to see whether his effusion has been honoured by appearing in print. As evening approaches the spirits of the spare fireman rise until the 'dutylist' for the morrow is exhibited on the shed noticeboard. With a rush he speeds to the board, and eagerly scans the list to see whether he is booked for firing on the morrow. After disappointmentsmany or few, depending upon the exigencies of the traffic - on one always-to-be-remembered evening he has the satisfaction of seeing his name down to fire on a 'yard pilot' or 'travelling pilot' for the next day. His first experience of firing is a veritable red-letter day in his career; and, given a kindly and considerate mate as driver, the new hand usually gets through his work successfully.

Having once 'fired,' it does not follow that such work will fall to his lot daily. If the railway be busy he may get a good deal of fireman's duty; but, on the other hand, his name will probably only

appear on the duty-list occasionally.

In process of time, the length of which depends upon the amount of traffic to be worked, the spare fireman becomes a regular engineman, and fires on a 'pick-up' goods or the even more humble ballast train; still, he is on the highway to the goal of his ambition-an express engine-driver. As a fireman on the road he enters upon a new phase of the education of an engine-driver. When firing on the pilot, the coal and water supplies of the engine have absorbed the whole of his attention; but now, when travelling over the line, he must observe the signals governing the road upon which he is running. The duty of 'learning the road' is an important part of his training; for not only has the meaning of the various signals to be mastered, but the position of various banks and curves must be noted and remembered; the conditions governing the approach to and departure from stations, aidings, and junctions have also to be committed to memory. A new hand must study well the 'Appendix to the Working Time-Table,' which contains numerous minute directions regarding speed restrictions at certain points, special signalling appliances, directions as to working over certain sections of the line at specified places, and many other things necessary for a man on an engine to know.

The fireman has, of course, his usual duties to perform. Before starting on the journey he will see that steam has been sufficiently raised, that the boiler is well supplied with water, and that the tender carries the requisite supply of coal and water. The head-lamps, injectors, &c. need attention; and when the train is once under way, especially when the load is heavy, the up-gradients severe, or the train is booked at a high speed, he is practically shovelling coal on to the fire the whole time. This work is not so arduous on a slow goods train; but as the fireman gets promoted and fires on express trains running for long distances without stopping, the physical feat of transferring several tons of coal from the tender to the fire-box is not one that many of our readers could perform. To be plying a coal-shovel continuously for four hours or more at a stretch needs considerable stamina, and it has been suggested that the practice obtaining on Indian railways should be introduced here, and that two firemen should be allotted to the modern mammoth locomotives working the present-day expresses, which run for a hundred, two hundred, or even more miles without a stop. Two firemen have also been asked for in the case of the gigantic goods engines now generally in use.

Our fireman has not, however, yet reached so important a post as to be firing on a locomotive giant, so we will accompany him to the shed at the end of his day's trip and see what his duties are before signing off. These are by no means slight. The smoke-box must be cleared of ashes, the boiler filled, and the fire drawn—a lengthy and trouble-some piece of work if bad coal has been burnt, as clinkers will have formed on the fire-bars, and to remove them is no easy job. The ashes have next to be cleared from the ashpan, and the tools,

lamps, &c. put away.

Gradually the fireman is promoted to working on more important trains, and all the time he is learning as much as he can about the engine and its working, for each month brings him nearer the time when he will be examined for the position of driver. This examination is much more elaborate and severe than the fireman's. First his eyesight must again be examined, and the eyesight-test for a driver is much more stringent than that for a fireman, and many men after years of hard work find they cannot become drivers because their eyesight is not sufficiently good. We will, however, assume that our aspirant has perfect sight. He next proceeds to be examined as to his acquaintance with the anatomy of the locomotive engine: how to manage it, what to do when failures occur and when accidents happen

and on many other points that the examiner considers the would-be driver should have knowledge of. Let us hope he succeeds in satisfying the examiner; if he does he has reached the first rung on the engine-driver ladder to fame, for he is a 'passed' driver.

Being a driver, sooner or later he will be placed in charge of an engine, usually the pilot in the locomotive yard. The work of this humble 'puff-puff' consists of shunting about the 'dead' engines, and placing them in position for the washers-out, placing them in order for leaving the shed, and similar work; but the nature of the work counts for naught at first. The man is a driver at last.

Promotion follows much the same course as it did with the fireman. The recently passed driver is given a shunting-engine to drive, after he has gained experience on the locomotive-yard pilot; then a local goods or travelling pilot; later a slow goods, coal, or mineral train; and as he gains experience a through, and finally an express, goods train. At last he finds himself in charge of a passenger train. Of course it is but the local. Still, he is driving a passenger train; but probably by this time most of the enthusiasm that caused him to take to the railway with the position of driver as his goal has died out. He cannot, however, fail to enjoy the pleasure of success when he finds himself driving a passenger train for the first time.

The same graduations of service on passenger eagines have to be gone through before the driver a cutiled to drive a 'crack' express, so that to be one of the regular drivers of these 'flyers' may never fall to the lot of our hero.

We have already mentioned the necessity of 'karning the road,' and this knowledge, partially aquired when a fireman, has to be made use of daily by the driver. On small railways men can learn the road of the whole system; but this is obviously impossible on the large lines, where drivers are consequently attached to a district which they know thoroughly, so that their experience is somewhat loal When new or altered signals, &c., are brought into use, the drivers working that portion of the road are supplied with details, diagrams, &c., to that they may be conversant with the altered conditions affecting them. It happens at times that adriver has to work over a portion of the line of his own company with which he is not conversant, or even over the lines of a 'foreign' railway. On ach occasions a third man, who 'knows the road' to be travelled over, rides on the engine. He is alled what he actually is—a pilot; his business is to ratch the signals and explain same to the driver, but the pilot does not interfere with the actual

Let us accompany the driver on a journey. Having ascertained the previous day from the duty-list the train he is booked to drive, he will arrive at the shed and book on, obtain the keys of his lool-boxes, and proceed to examine the notice-board. The should here state that there is issued each week

a printed notice containing particulars of repairs, alterations on the line, bridges, signals, &c.; details of new roads, signals (with diagrams), &c. to be brought into use during the current week. This notice the driver-so far as it affects the portion of the line over which he works-must make himself thoroughly acquainted with; but unforeseen, and therefore unprovided for, events happen on railways, as elsewhere: the water-supply may fail at a certain station; a bridge may develop signs of weakness; a cutting shows evidences of falling in, or an embankment of subsiding. Such events are chronicled on the notice-board in the running-shed as soon as they happen, so that the drivers may be prepared to act in each case as the circumstances demand.

After taking particulars of the notices that affect the portion of the line over which he will be working, he proceeds to his engine and makes a minute examination of her. No perfunctory survey will do, for unless the driver carefully examines, and when necessary puts right, every part of the machinery that can possibly go wrong, he is sure sooner or later to have a bad failure when running a train, if not a serious accident.

The examination completed, the driver moves his engine into a suitable position for backing on to his train when the time arrives for him to do so. Having backed on to the train, both the driver and fireman have certain duties to perform before the train can go on its journey. Those of the driver are as follows: (1) To deliver up his 'ticket' to the guard, who will during the journey record on it particulars of the running of the train. (2) Learn from the guard the number of vehicles forming the train, and the number of wheels upon which the continuous brake acts. (3) To raise the vacuum by means of the ejector, keeping the ejector open until the vacuum-gauge shows the amount of vacuum required to be maintained while running. (4) Recreate the vacuum after it has been destroyed by the guard in the rear van; the destruction of the vacuum being made to test whether the brake is in order and the pipe's connections through the train properly made.* On trains not yet fitted with the new passenger-signal, which is actuated by the brake apparatus, the driver also has (5) to pull back the communication-cord and shut off the whistle after the cord has been pulled from the rear of the train. This pulling is for the purpose of testing the continuity of the cord.

Having carried out these duties, the driver awaits the 'right away' signal from the guard. It is not generally known that this signal does not authorise the driver to start; it is merely an indication to him that the station duties are completed. If the starting-signal is not off the driver whistles for it to be lowered, but he must not pass it until it is off.

Nos. (3) and (4) are applicable to trains fitted with the automatic vacuum brake. With the Westinghouse brake the requirements are somewhat different.

Sometimes guards do not give the 'right away' signal until they see the starting-signal lowered, but on other occasions they only take cognisance of the station duties without reference to the signals.

The driver must exercise great care in starting his train, particularly when it is a heavy one; for if he immediately open the regulator too fully, the pistons, valve-gear, and reciprocating machinery receive a severe strain, whilst the driving-wheels revolve, but the train does not progress. In starting, especially in damp or frosty weather, it is frequently necessary for the fireman to open the sand-valves, so that sand may fall on the rail in front of the driving-wheels and so increase the adhesion of the wheels to the rails. This work requires to be performed carefully, or damage to the machinery is liable to happen, consequent upon the wheels which are revolving at a high speed on a slippery rail being suddenly checked upon coming to the portion covered by the sand.

A successful start having been negotiated, the driver 'notches up' the reversing lever which actuates the valve-gear, and so by means of the 'cut-off' regulates the amount of steam admitted to the cylinders. The amount of 'notching up' necessary for obtaining the best results—that is, the consumption of the least fuel to do the largest amount of work—depends upon a variety of circumstances: the train-load, the weather, the state of the engine and fire, the gradients, booked speed, &c.; but it is in the manipulation of the reversing lever that the qualities of the driver have an

opportunity of shining. The railways naturally desire to work their traffic as economically as possible, and inducements in the way of 'coal premiums' are paid to the drivers who are economical in the matter of coal. The advantages and disadvantages of the coal premium are many, as so many circumstances have to be taken into consideration, but lack of space prevents us from discussing the various pros and cons in this article. Some drivers will sacrifice everything rather than lose their position on the premium-list, whilst others will place the 'greatest good of the greatest number' before their individual gain. It is even rumoured that 'coal-dodgers' will purloin coal from their mates' engines so as to see their own names high up on the premium-list.

The driver's attention is now directed to looking out ahead for the signals, and to see whether there are any obstructions on the line; and here his knowledge of the road becomes useful to him, for it has taught him the exact spots where he will first observe the various signals. The view of one may first be obtained from one side of the foot-plate, and of the next from the other, so that although he has a definite position on the engine—the right hand on some railways, the left on others—he will constantly be changing places.

There is a movement that desires that the signals should be electrically repeated inside the cab of the engine, thus removing from the driver the mental

and eyesight strains of constantly looking out for the signals. There are obvious advantages in such a system, but it must not be forgotten that the signals are not the only things the driver has to look out for. He must watch the road ahead of him; it may be obstructed in a hundred ways out of the ken of the signalman, whose signals consequently are off, and if the enginemen are not keeping a sharp lookout ahead, frightful accidents may happen. Now and again travellers hear a warning whistle, and at times feel the rapid application of the brakes, and it may be that on these occasions, but for the vigilance of the driver's lookout ahead, a direful calamity would have happened.

The driver's eyes are needed within the cab also. He must watch the gauges and see that the fireman is keeping up the supply of steam by proper attention to the fire, and that the water in the boiler is maintained at the proper level, that the lubricators are working, &c. The roar of the train prevents much talking between the men on the foot-plate, but by means of signs they convey information to each other relative to the working of the engine, the signals, and other germane matters.

On several railways the water-supply in the tender is replenished by means of an apparatus which scoops up the water from tanks placed between the tracks. The lowering of the scoop is done by the fireman, but the raising of the pick-up apparatus after use requires the assistance of both fireman and driver. Methods for working the scoop by means of steam, compressed air, or vacuum are now engaging attention.

At night-time their knowledge of the road enables the enginemen to locate these troughs, and in this they are assisted by the peculiar noise made by the train passing over the troughs.

This reminds us that the driver's ears as well as his eyes enter largely into the performance of his duties. The various sounds made by passing through stations, cuttings, retaining walls, over or under bridges, &c., have each a distinctive voice to the driver's practised ears; and at night-time by their duration, in conjunction with preceding and succeeding sounds, &c., the experienced driver is able exactly to locate his position.

Above this tremendous din there is other and constant work for the ears of the driver. He is ever listening to the beat and rhythm of his engine. This naturally varies with the speed, but such variations do not concern the driver; it is for any strange note in the sound that he is always on the qui vive. Having heard an unfamiliar noise, however slight, the driver concentrates his whole attention upon an endeavour to locate the spot from whence it proceeds. Its position having been discovered, his knowledge of the machinery generally enables him to come to an accurate conclusion as to its cause, and he quickly decides what must be done under the circumstances. If

he be unable to discover the source of the sound, he will at once take steps to do so, either by examining the machinery whilst travelling or by stopping the train. Failure to hear an unusual moise such as the above would probably result in a serious accident to the engine, and possibly to the train.

At last the journey is at an end, and the weight of responsibility is lifted from the driver's shoulders; but his daily task is not yet finished, for upon completion of his day's running he must take his engine to the shed and attend to its coaling for the morrow. This is most important, especially when cal premiums enter into the matter. The fuel is very carefully weighed, and an accurate account is kept of the weight supplied to each driver. This amount and the number of miles run form the data upon which the position of the various drivers on the coal-premium list is worked out. It therefore belowes the driver to make sure he obtains all the coal debited to him; some 'coal-dodgers,' it is whispered, by hook or by crook obtain even more.

The enginemen next visit the engine-shed. Here the driver makes out his ticket, giving particulars of his journey and of the stores (oil, waste, &c.) he has obtained. He also reports any unusual circumstances that have come under his observation whilst on daty. Having previously examined his locomotive, he enters in the repairs book anything that

requires attention, should such there be; then, with a parting glance at the duty-list and the notice-board, he makes for home, feeling the satisfaction that arises from the knowledge that he has faithfully performed an arduous day's work.

Lack of space precludes us from mentioning any of the many remarkable circumstances that arise in the career of a knight of the foot-plate. Some of these are noted in the article, 'Heroism on the Foot-plate,' in this Journal, No. 480. We have but described his daily avocation when all goes well; but when crises happen, as happen they will and do, it is comforting to railway travellers to know that our sturdy British engine-drivers are not found wanting in the necessary resolution, decision, skill, and heroism to meet and deal with them. The safety of the passenger is the cardinal rule that the engine-driver acts upon, and many have sacrificed their lives, and hundreds their limbs, in the faithful discharge of this obligation. Happily for the drivers, no less than for the traveller, so many improvements and safeguards have been introduced into modern railway working and railway apparatus that occasions for so heroic a devotion to duty do not often present themselves; yet we may rest assured that should the circumstance require it, our engine-drivers will ever be found to place strict devotion to duty before all other considerations.

THE LORD OF THE MANOR.

By FRED M. WHITE.

CHAPTER XV.

RAGGED moon just gave sufficient light for Miss Castlerayne and Angela to keep to the path across the Common. It had been much darker when Angela felt her way towards

the hospital. She had known every had of it all her life, but it had been terribly hard with to reach her goal in the darkness. There in the pitfalls and stumbling-blocks that she had with the darkness of dangerous gullies and heathery waterways that in the daytime were no more than days for the late gentians.

Tour dress is all in rags around your feet!' Amt Certrude exclaimed. 'It was very brave of the total total the total

I did not stop to think,' Angela said simply.

I was so horribly frightened. And I know that a crisis like this we could not do without you.

They had struck a cart-track by this time, so that raiking was comparatively easy. Miss Castlerayne Them:

There is very little to tell, Angela explained.

Did came back from Hardborough in a very separate state of mind. Mr Summers had pointed

out to him the hopelessness of the situation. He had urged bankruptcy. He said that when everything was disposed of we could let The Towers, which would produce a living income. He wanted dad to take that step at once to prevent the humiliation which has come. The thing should have been done at once; but of course dad put it off. And to-night, about an hour ago, the blow fell. It was horrible!'

'You mean that—that— I hardly know how to express it, Angela.'

'Yes. A man came—two men, in fact; and one of them remained—he will not leave till the money is paid. Don't ask me what money, for I can't say. Dad came into the dining-room and told us. Then he burst into a dreadful laugh and dropped into a chair. It was a stroke of some kind. Evidently he has been grieving and worrying far more deeply than we had imagined. And I came for you, dear.'

The words were simple enough, but Miss Castlerayne did not fail to read the tragedy that lay behind them. A little time before, and she had been praying for some strenuous occupation for her hands and head, and the prayer had been answered. 'Will he know me, do you think?' she asked anxiously.

'I fancy so. I don't think that the mind is affected, only the body and power of speech. I am quite sure that dad was terribly upset to find you gone. From what he said, he was only posing last night. I expect that the phrase as to your being a guest in the house struck him as clever. I am certain he was very sorry.'

Miss Castlerayne was glad to hear it. The ragged moon was falling behind the walls of the old castle and the trees beyond; there were lights all over the house. May sat in the dining-room by the side of her father, still chafing his hands. As yet the doctor had not put in an appearance.

Gertrude Castlerayne came and bent over the couch; a little sigh of gratitude escaped her. She wanted no telling that nothing was wrong with the brain of the stricken man. There was no sign of apoplexy or serious mischief of that kind here. The eyes were too clear for that, their gaze steady and sane. There was utter paralysis, the result of a great shock.

'Can you understand what I am saying?' Miss Castlerayne asked. 'You know where you are?'

The clear eyes responded where the tongue was useless. The head of the house understood.

"I am going to remain here,' Miss Castlerayne went on. 'I should never have gone away. I shall be only too glad to do what I can.—May, you have sent for the doctor?'

May responded through her tears that such was the case. The girl was crying quietly without being in the least aware of the fact.

It was a great relief when Dr Marfell bustled in presently. The white hair was ruffled on his head as if he had had no time to brush it, as if he had tumbled straight out of bed to come here. He nodded curtly without waiting to waste time in words of sympathy. He proceeded with his work.

'Paralytic stroke,' he said. 'Result of some shock. Easy-going people are often more easily knocked over than those who fret and worry. There are no sinister signs, and the patient knows exactly what I am saying. He must be got to bed; he must get aleep, though I don't want to administer drugs if I can help it.'

Mr Castlerayne was in bed at length; he lay there absolutely still, with his eyes closed. At the instigation of Dr Marfell, there were no lights. He could do nothing further, he said; it was all a question of time and nature. He would come again in the morning.

Angela followed the speaker into the dining-room, where May was waiting.

'Is it very, very bad?' she asked. 'Is there any hope of recovery?'

'Bless my soul! yes,' Marfell snapped. 'Every chance. Your father is not yet sixty; he has a sound constitution. He has been worrying lately, and the shock has been too much for him. If you could only remove the source of anxiety he would

pick up marvellously. I've known cases like this practically cured in a fortnight. And, mind you, his brain is quite clear; he knows every word that you say to him. If you can remove the trouble'——

May started eagerly. She moved as if about to say something; then she changed her mind.

'The trouble is in the kitchen,' Angela said bitterly. 'It takes the form of a sheriff's officer—I believe that is the legal jargon. It means, Dr Marfell, that the Castleraynes of The Towers have ceased to exist as a family; it means that we shall have to leave here. I am afraid that that trouble is permanent, if my father's recovery rests on that.'

'I didn't say it did,' Marfell retorted. 'I said that the removal of the trouble would facilitate the recovery of the patient. I hope to pull him round in any case. What you have to pray for is a good night's rest for him, which will be better than all the medicine in the world. I am going to

leave things to nature for the present.'

It was a long and lonely vigil that Angela insisted on taking on herself. She drove Miss Castlerayne to bed on the understanding that the latter was to be called if necessary. She would not hear of May sharing her watch. She sat there in the velvety darkness by the bedside, listening to the heavy breathing of the sick man. On the whole, these were the darkest and most miserable hours of the girl's life. She did not realise, perhaps, that she was better for the ordeal; but so it was. The glory of the family had departed; henceforth there were going to be no Castleraynes of The Towers. She and May would go and get their own living as girls quite as well nurtured as themselves had done before. It seemed incredible now that she had held up her head so haughtily with the full knowledge of the shameful indebtedness of the family. How much nobler had been the part played by the Warreners! Contact with trade had not contaminated Clifford Warrener; he had been enabled to make a garden from an arid desert. Angela blushed as she thought of that June morning in the rose-garden. She had had her chance then; the best man she had ever met had loved her, and she had scorned his advances. He no longer cared for her, or he would never have stayed away all these months. These thoughts and others played through Angela's mind as she sat there till the velvet blackness of the room turned to a sombre gray, and the gray presently was shot with saffron tinges. Then the gold and pink edged the saffron, and the pearly dawn came tiptoe from the mists of the Common. The stentorian breathing from the bed had ceased. Angela bent, to find that her father was fast asleep.

This was exactly what Marfell had hoped for. It was necessary to keep the house quiet.

May came in presently to relieve Angela's long vigil. She hoped that Angela would go and sleep for a few hours.

'I have not the least disposition to sleep,' Angela

whispered. 'I am going to have a bath and a cup of milk. Then, as it is such a lovely morning, I shall take a long walk across the Common and back. All you have to do is to keep the house quiet.'

The red rim of the sun was climbing over the fringe of pines behind the hospital, driving the pearly mists before it. The air was fresh and sweet from the sea, so that a faint wave of exhibaration filled Angela. So far as she was concerned, the bitterness of disgrace and trouble was past; she was in the mood of contentment and the dinner of herbs. She looked very dainty and refined as she reached the fringe of the Common. There was a kind of big valley here, interspersed with patches of gorse and heather, and a ragged pit where the drift and lay. The floor was carpeted with the thick grass of centuries, and each fine blade sparkled with the dew of diamonds. There was the sound of a crack behind, and a little white ball fell almost at Angela's feet. Then came another. It was borne in upon Angela's mind that somebody dose by was practising golf-shots.

'Absolutely perfect,' a clear voice rang out.
'Nothing better in the kingdom. That line of
lateral hazards on the left side of the valley'—

The voice stopped. Angela had recognised it. A moment later and Clifford Warrener was properly apologising for the carelessness of himself and his companion. He had not expected anybody to be out on the Common at that hour of the morning.

'I might have killed you,' he said anxiously.

'You see, it's a blind hole—I mean from where stood in the valley—and out of sight. You have my friend Brooke?—Brooke, come and help have to make my peace with Miss Castlerayne.'

The tall man in the Harris tweeds abased himall before Angela. He was exceedingly sorry, but one of his balls had rolled into a patch of heather. It was a new kind of ball, and he was anxious not to lose it. If Miss Castlerayne would excuse him'——

'Golf lunatic,' Warrener laughed as his colleague moved away; 'otherwise quite sane. He is a marvellous player, and one of the great scribes of the game. You will see later on the uses that I shall put Brooke to. You are out very early, Miss Angela, and, if I may be allowed to say it, you are looking very tired.'

Angela proceeded to explain. She conquered her pride to that extent. It was better that Warrener should hear the story from her lips than hear it garbled by gossip later on. And as the story proceeded, Angela was glad that she had confided in Warrener. He looked very handsome and very sympathetic as he listened to what she had to say. Her words were well spoken and to the point. There was a light like a flash of triumph in his eyes.

'I think I can be of assistance here,' he said.
'Indeed, I am quite sure of it.—Brooke, will you take the clubs back to the farm and ask that breakfast should be ready for me in half-an-hour? I find that I have to go in to Hardborough.—I am sorry that I left this thing so long to take care of itself.'

'You speak as if the fault were yours,' Angela said.

'Well, so it is to a great extent,' Warrener said with a cryptic air. 'Still, Dr Marfell is right in saying that the removal of the source of the trouble will be attended by the happiest results. I shall be able to try the experiment. It would be a terrible trial to you to have to leave the old house behind you.'

'I think I could endure it,' Angela confessed. 'I am not so proud as I was.'

(To be continued.)

80ME WANDERINGS ABOUT NEW BRITAIN.

By Louis Becke.

OUR-FIFTHS of the great semicrescent-shaped island of New Britain is still practically a terra incognita; and whatever discoveries have been and are being made as to its savage inhabitants and its farm

inhabitants and its flora and fauna to be made known to the world except through the medium of the German scientific press; and tareller and explorer—does not take kindly to testing publications in the German language.

My first experience of the great island and its arge and treacherous inhabitants dates back four-twenty years, when the only white residents (shout thirty) were located on Gazelle Peninsula,

at the eastern end of the island. Some years later I visited at various times the extreme western and southern portions, where there was not a single European, and my observations and experiences may prove of interest.

First of all, however, the reader will gain a definite idea of the extent of New Britain by the length of its coast-line, which is about nine hundred miles. In many parts the island is very narrow, and could be crossed in a day's march if there were any track through the dense jungle or over the mountainranges. Everywhere it is well watered, and the country presents a great diversity of scenery: high mountains (in the east), heavily timbered forest, open and lightly timbered downs covered with high grass, long belts of mangrove coast, and, in parts

of the northern coast, miles and miles of country that presents the appearance of a carefully tended English park. The beaches are short and of black volcanic sand; and wherever the foreshores are backed by mountains or hills, fresh-water can be seen bubbling up out of the sand at low tide.

But now I am getting to leeward of my subject, which is to describe some of my tramps and excursions along the shores and into the interior of this little-known island, and what I obtained in the way of sport with gun and fishing-tackle, and a knowledge of the habits of its people, during my first long stay and subsequent shorter visits to New Britain. The acquisition of this island by a foreign Power, and one by no means too friendly to Great Britain, has since made sore the hearts of those Britishers who first put foot on Melanesia and helped in a minor and unrecognised way to expand the Empire of Britain beyond the Seas.

Arriving at the Duke of York Islands (midway between New Britain and New Ireland) at the end of 1882, I found there the remnants of the ill-fated La Nouvelle France Expedition, sent out by the Marquis de Ray to colonise New Ireland. Many of them had died of fever, others had been killed and eaten, and those who had survived were in a state of mutiny. The English traders rescued them from the 'city' (on paper) which they had founded on New Ireland, and brought them over to the Duke of York Islands, from whence many of them were sent to New South Wales, where they were very generously treated by the Government, and given grants of land. The colony was comprised of French, Italians, and Spaniards. The two latter communities were decent but brutishly ignorant peasants from Calabria and the north of Spain; the French contingent were a bad lot on the whole. The original six leaders were military men who had been expelled from the Foreign Legion in Algeria for misconduct, and the women had mostly been recruited from the worst resorts of Toulon and Marseilles.

The principal English trader at the Duke of York Islands was a man named Tom Farrell, an excitable Irishman, but with a keen eye for the main chance. He was, however, very good to all the wretched people who were ill and dying of fever; and being a man of iron will and determination, he, in conjunction with some of the better-disposed Frenchmen, assumed charge of the hopelessly broken-up and disorganised 'colony of New France.' overawed the mutinous rowdies by threatening to turn loose upon them his hundred or so of savage Solomon Island labourers, took possession of the steamer Genil and the storeship Marquis de Ray, and compelled the rowdies to disarm. All the vast stores of food, wines, and spirits he brought on shore and kept guarded, and thus put a stop to the orgies and debaucheries that had hitherto prevailed.

The captain of the Genil was a really gallant little fellow named Rabardy. He was dying of

worry and fever on board his steamer, and sent for me one day and told me that he had heard some of his passengers quarrelling as to who should have his chronometer watch when he was dead! 'I am glad to think these ruffians will trouble me no more,' he added. He died a few hours later.

Almost at the same time that poor Rabardy died, there arrived at the abandoned 'city' at Liki Liki Bay, New Ireland, a steamer named Nouvelle Bretagne, with a fresh contingent of five hundred Spanish colonists, who had left Barcelona in ignorance of the fact that Nouvelle France had collapsed. And twenty-four hours later came another steamer, which, dropping anchor close to the French vessel, ran up Spanish colours, lowered a boat with an armed crew, and in ten minutes the Nouvelle Bretagne was in the possession of a prize crew from the Spanish transport Legaspi of Manila, which had been chasing her hard and fast ever since she had left the Philippines.

The story, in one sense, was a comedy. Here it is, as related by the commander of the Legaspi. It seems that the New South Wales Government had informed the Governor-General of the Philippines of the disastrous break-up of the 'colony,' and so the moment the Nouvelle Bretagne anchored in Cavite Bay, Manila, the authorities warned the immigrants of the fact, and urged them to proceed no farther. But they would not credit the news, and were so bent upon going on that the steamer was seized and a guard of twelve men placed on board. Then the Governor of Manila communicated with Madrid in the usual leisurely Spanish manner to know what was to be done. The immigrants were furious, and the Governor, fearing that the steamer might try to slip away, had part of her steam-chest removed and brought on shore. A week passed, and then came signs of an impending typhoon, and the shipping made preparations to meet it. Captain Henry of the Nouvelle Bretagne, a Frenchman, hurried on shore and pleaded that either he might land his passengers or that his machinery should be returned, so that the steamer could ride to her anchors with steam up. 'If my ship goes on shore through want of steam,' he said to the authorities, 'not only will you be responsible for her loss, but if the wretched passengers are on board they will all perish, and you will simply be committing wholesale murder.

The authorities were in a quandary. They did not want to be burdened with hundreds of penniless and helpless peasants, nor were they devoid of humane feelings. So the missing machinery was restored in haste; and as soon as there was a sufficient head of steam, Captain Henry was told to lift his anchor and proceed to a more sheltered position. He obeyed. Meanwhile he had consulted with his officers and resolved upon a daring course. As the evening came on and the steamer was proceeding to her new anchorage, Henry's crew overpowered the Spanish guard, placed them under hatches, and the Nouvelle

Britagna, under every ounce of steam she could raise, put out to sea in face of the coming typhoon. The forts, not knowing that anything was wrong, and everything being in confusion, let her pass. There days later Henry landed the imprisoned guard at a spot on the island of Samar, hundreds of miles from Manila. He steamed in a northerly direction after leaving Manila, escaped the full force of the typhoon, and eventually reached New Ireland safely—with the Legaspi at his heels.

A few hours after the capture of the Nouvelle Bretagne, the commander of the Legaspi called her passengers together and addressed them. He gave them their choice of remaining to die of fever in New Ireland or of returning to Manila and from thence to Spain. 'You see,' he said, 'what is before you here: a wild and savage country inhabited by a race of stark-naked and disgusting cannibals. You were led by lying French agents to believe that you were coming to a new land and a new city, where the vine and the citron and orange grew in profusion, where a cathedral had been built, and where you would find everything the same as in Spain, but more beautiful. The Bishop, with his six priests and ten Sisters, who came here to this desolate and horrible place before you, has long since returned to Europe. There is no Nouvelle france. It existed only in the brain of the rogue of a Frenchman who has deceived you. Those of you who doubt my words are at liberty to stay here; and at the Duke of York Islands you will et others of your countrymen, and Italians and French people, who have been rescued from death by the English people living in these savage islands. Make your choice.

They made it quickly, and chose Manila. The appearance of the New Ireland natives who had come to board was alone sufficiently terrifying to the portion of the new Ireland natives who had come to board was alone sufficiently terrifying to the portion of the new Irelands of the New Irel

And so the Legaspi, with the daring Captain Henry havily ironed on board, took the Nouvelle Bretagne in tow, and steamed away for Manila; and the tragedy-farce of La Nouvelle France was ended. What became of Henry and the other leaders I fonce, had to pay a fine of thirty thousand france, and was sentenced to four years' rigorous imprisonment. He died only a few years ago in poverty said obscurity. Like the originators of the South Set Bubble and John Law's Mississippi Scheme, he have absolutely nothing of the country to which he was sending the ill-fated colonists, nor did he care for aught beyond his own enrichment.

After a few months at Meoko in the Duke of York Islands, I was sent to Kabaira Bay, the farthest-out station on New Britain. I sailed across the strait in a boat manned by natives, and carrying my stock of trade-goods and my own personal effects. Two days later I found myself alone and at work, the boat having returned to the head-station. Here I remained for six months, until a severe attack of malarial fever compelled me to leave New Britain and proceed to Samoa to recruit.

During my stay at Kabaira I and the few other traders in my district had some serious trouble with the natives of a large village named Kābakadā. They attacked a watering-party from the German labour-recruiting vessel Nuiafou, and then threatened to massacre all the resident white men. As a lesson, we, aided by the vessel's crew, burned two villages and destroyed their canoes, &c. Later on they made peace by paying us a heavy fine in dewarra (shell-money threaded on the mid-rib of the coco-nut leaf).

With the people of Kabaira, however, I was always on very friendly terms. They certainly had a bad reputation. My immediate and only predecessor, the Hon. G. S. Littleton, had been speared to death as he lay reading in his bunk one night. Then soon after a Captain Murray and three of his crew had been murdered by the people of a small mountain-village situated a mile or so back from my house. But in both cases the white men had been distinctly to blame - Mr Littleton especially. I need not enter into particulars, which would be tedious, but will merely say that the savage natives had reason to believe they had been deceived by the unfortunate white men in regard to trading matters, and, knowing no law of retaliation but that of the spear and club, they had exercised it remorselessly. In poor Captain Murray's case, the lives of his men and himself would have been spared had he exercised a little tact and asked for a quiet 'palaver.' But during the discussion he and his men drew their revolvers to overawe the justly angry natives, and then followed the tragedy. Several of the natives who had taken an active part in the killing of Murray and his men frequently visited me, and not only did I sleep in their village several times, but these very men accompanied me in my shooting excursions into the interior, and, I am vain enough to think, entertained very friendly feelings towards me. This was due to the fact of my never carrying a revolver, and letting them carry not only my Winchester carbine, with its ammunition, but also my shot-gun. I was perfectly well aware that if these savages had had any grudge against me they could easily have wiped it out with a spear-thrust in the back or a blow from one of their long-handled, stoneheaded clubs. But knowing that they had no such ill-feeling, I had no hesitation in going far inland with them, sleeping in their villages, and pointedly requesting the chief to take care of my guns and see that the 'young men' did not tamper with

them or take them out in the night air with its heavy dews.

On the splendid rolling downs between Kabaira and the Gazelle Peninsula were many clumps of white cedar-trees, which when in flower were resorted to by thousands of white cockatoos and very large green-and-scarlet parrots, all feeding upon the sweet flowers. They presented a very beautiful sight as they climbed in and out among the foliage, talking and screaming. The natives catch them very easily and sell them to the traders for a mere trifle. Hundreds of the parrots are sent to Sydney, where they sell at ten shillings each, being excellent talkers. I had nearly a dozen of them in a cage of wire-netting, and in a few months they became quite tame. The cockatoos I frequently shot as well as the parrots, for both made excellent soup. Pigeons were in such abundance that I often shot them from my veranda; and from dawn till dark their deep notes filled the surrounding forest. At certain times of the year they are almost uneatable owing to their feeding upon the small red chilli berries, which render the flesh quite pungent. Another curious habit of the New Britain pigeon (before-mentioned in this Journal) is their periodically resorting to and drinking salt-water. As at low-water on the beaches of New Guinea freshwater may be seen bubbling up from beneath the sand, I thought at first that the birds came for this, but soon saw that they took no notice of it whatever, but went to the edge of the beach, both at high and low tide, and drank freely of sea-water.

Among other birds, I shot several splendid hornbills for specimens. Golden plover were also in plenty, as also were a species of sand-grouse, so my larder was always well supplied. For vegetables I had yams, taro, native spinach, and bread-fruit. Fruit was scarce, except excellent wild mangoes, bananas, and pine-apples; the two latter are not indigenous. Fish are plentiful, and the native fishtraps are marvels of skill and ingenuity. In many of the streams are large crayfish, and often, in my excursions, at the end of the day I would have for supper some baked crayfish, a grilled pigeon or two, or perhaps a baked fresh-water fish, all cooked in the native style in a ground-oven with red-hot stones covered with leaves. Yams or taro (Arum esculentum) were always to be had at any village, and the New Britain taro is the finest in the Pacific, some being eighteen inches long and weighing from five to six pounds.

The natives' plantations are something to wonder at. They are kept as free from weeds as any 'show' vegetable-garden in the British Isles, and are usually brightened by numbers of crotons of the most brilliant and diversified hues. In no other island have I seen such a variety of these handsome-leaved plants. At one cannibal village on the west side of Kabaira Bay all the houses were surrounded by carefully tended crotons, and even the steep mountain-paths leading to the village were bordered with plants, some of them, with

curiously long twisted leaves of scarlet spotted with orange, being ten feet high. The people of this village had long been at ennity with those of Kabaira; yet during my frequent visits there my boat was always manned by Kabaira men. Their being in company with a white man bent on trading business rendered them neutrals; but nevertheless no one of them cared to go more than twenty yards away from the boat.

The natives of New Britain generally are hideously repulsive in appearance; but in this particular cannibal community I saw some with fairly good features, and they were quiet and civil in demeanour. Here I bought a considerable quantity of black-edged pearl-shell, which I paid for with fine red 'seed' beads, tobacco, butchers' knives, and tomahawks. Like the farther away natives on Gazelle Peninsula, the men all carried long stone-headed clubs, and the usual half-dozen slender spears beautifully ornamented with a fine embroidery of cane-work and scarlet feathers. Both men and women were nude, and I saw that only two or three were covered from head to foot with the skin-disease known as tinea desquamans. On my last visit I presented the head-man with a pound of tobacco (worth two shillings); in return he gave me a basketful of twenty splendid red mullet, each of which weighed over five pounds, three fine clubs, and a bundle of spears.

My next visit to New Britain was to the western end, to a bay opening out into Dampier Strait. Our vessel was a small one, and our cruise was for the purpose of discovering pearl-shell beds and to gain some knowledge of that utterly unknown part of the coast and its inhabitants, with a view to opening up communication with them, and, if necessary, establishing a station on some suitable part of the coast. Although so small, our schooner carried a crew of fifteen well-armed men, and every care was taken to prevent our being surprised and cut off. We found many villages along the coast, and inland the constant streams of smoke we observed showed that the interior was inhabited. After immense patience we at last got into touch with the people of a small village near Cape St Ann. They spoke an entirely different dialect from the natives of Gazelle Peninsula, and were also of a different physique. None of them would venture on board; and although all were armed in the usual way, they were exceedingly timid and nervous, and I am sure that no one of them had before seen a white man at close quarters. They had no idea of the use of beads, but eagerly accepted knives. Ship-biscuit they smelt at but would not eat; tobacco and clay pipes were also smelt and rejected. No women came with them to the beach, and they evidently did not wish us to come to the village, which was situated a quarter of a mile inland, among a grove of coco-palms, at the back of which was a perfect forest of betel-nut palms. For some days I tried hard to get two of the least timid of these savages to come on board with me, but in vain. They would not stir from the beach. Then one day, taking with me two native seamen, I set out for the village, with some knives, &c., for presents. About a score of fully armed men met us as we landed, and when they found I was going to the village they all darted on ahead, shouting and yelling. In five minutes we heard the hoarse clamour of wooden drums, and then a dead silence.

After waiting half-an-hour, and hearing and seeing nothing of our friends, we advanced cautiously till we ame in full view of the village. It was deserted; not a soul was to be seen. Then, far off, the drums again began to beat. Not wishing to incur the ill-will of the people by prying about the interior of their hurriedly abandoned dwellings, I walked quickly past each house, throwing a new taife through each open doorway. Then we returned to the boat and went on board.

All that day and night we did not see a native, but inland we saw countless smoke-signals rising above the dense forest. In the morning the captain and I went to the village, and looking into the houses, saw that they had been visited; everything portable had been removed, the knives as vell.

That afternoon one of our crew hooked an immense fish of the tarpon species, weighing over two hundred pounds. I had it taken on shore and hung to the branch of a tree near the village. In the matrices did not appear, and for the time being we gave up the attempt to induce them to return. Some weeks

later we were quite successful, and they and we became good friends; but the story is too long to relate now.

Early on the following morning we lifted anchor and crawled along the coast, looking for a suitable place to land the vessel on the beach in order to effect some repairs; for we had twice been ashore on coral-reefs during the voyage, and lost a lot of our copper. Thirty miles to the southward we found a spot that answered admirably-a small, deep inlet, almost landlocked, with a steep-shelving beach of hard sand. The entrance to the bay was hidden by some small, well-wooded, and low islands inhabited by countless thousands of pigeons. Nowhere, as far as the eye could see, could we discern a sign of human occupation, not even a streak of smoke in the interior. With some of the ship's company, I made many long marches along the coast east and west, as well as going inland, but never saw even the track of a human being or anything to show that this part of the country had once been inhabited, until, the day before we left, we saw a great quantity of smoke in various places far inland, as if natives were burning off the forest so as to clear the land for planting purposes or for driving game. During our stay we experienced several earthquake shocks of considerable violence. Game and fish were so abundant that the ship's company lived almost exclusively upon them; and the country generally presented a beautiful appearance, especially in the higher parts. But the heat and the rains were terrific, and we all suffered more or less from fever.

AN OLD HAIR-PICTURE.

By HELEN PORTER.

OWADAYS, when there is a revival of everything old, when we rummage our cupboards and attic presses for anything curious and antique, bringing out daguerreotypes, woollen

pictures, samplers, knitted beads, but worked book-markers, to install them in the pet of honour in our drawing-rooms, it can only a matter of time till the old hair-work becomes the concerning the con

We are all familiar with the square or oblong broch with a plait of hair in its centre surrounded with sed-pearls or, more usually, garnets; these are to be obtained at second-hand shops for a mere triffs, and are of little interest to the collector, who is no sentimental value for the faded hair and to artistic admiration perhaps for the setting. And yet, if we come to think of it, there is elies of the past. The soft, fair lock of baby-hair: bow one wonders if the head from which it was cut trumed gray, or whether the young mother wore it with joyful pride or sorrowful heart-break! All

these old lockets, brooches, hair chains, woven-hair bracelets, have their separate and individual story; and in families where they are collected and valued, not as curiosities but as heirlooms, their histories are well known and preserved. Sometimes the backs of old miniatures contain a curl of hair; but I never remember seeing one on the reverse of a modern miniature. In Ireland the reason is not far to seek. It is a deep-rooted superstition that to wear the hair of a living person brings disaster to him or her; and it is probably the spread of this idea which has destroyed what we may call the romance of the lock of hair; it is no longer the theme of our songs or a usual love-token between engaged couples. Any time I recollect seeing hair worn it has been the hair of the dead, and therefore not mounted as what is known as 'ornamental hair-work.'

Sometimes these quaint souvenirs are of great interest and real historic value. My mother knew a very old Jacobite lady, the last of her race and line, who possessed a ring in which was enclosed the hair of Prince Charlie. He gave the hair to

one of her ancestors when on a visit to their home shortly before one of his unfortunate battles. It was absolutely authentic; but on the old lady's death the ring had disappeared, possibly stolen by some dishonest servant, who would sell for a few shillings what was worth a large sum, and what would have been a valued heirloom to those who succeeded to the historic castle—a castle whose great gate will never be opened 'till the king comes to his own again,' and whose main avenue is now a grass field on that account.

In one of her beautiful short stories Mary E. Wilkins alludes to the hair embroidery done by an old-world lady in America—an old dame who nearly wrecks the happiness of two lives by abstracting the red lock given as a love-token to make use of it in a design of rosebuds. From the story we gather that this sort of work was usual in New England, and consisted of wreaths of flowers worked in hair instead of silk.

My mother has an old 'family tree,' dating about 1785. At a distance it looks like a fine sepia drawing, the work is so fine and so evenly done. It is oval and about ten inches in length, mounted under glass in a gilt frame, and, hanging on the wall, passes for a landscape. It is only on taking it down and examining it that one sees what a real curio it is. It contains the hair of every living member of the family at the time it was done, for in those days men wore their hair long, and more material was available than in the twentieth century. A large tree stands at one side of the picture. Its roots and stem are worked in dark hair, with an occasional strand of gray in it; and as the tree bursts into branch and leaf the hair gets lighter and lighter. I believe that my grandfather's hair, as an infant, is in one of the topmost boughs. A few strokes denote water and outline the distant hills, while a small boat in full sail fills up the centre of the 'piece.'

I once took the glass off to see how it was done. It is worked on white satin-now yellowed with age—in ordinary embroidery stitches, including the 'French knot.' Here and there the hair is a little worn away, and one sees that the design was drawn most minutely in sepia or India ink, so that, though it is completely worked over in hair, there is a perfect drawing underneath; and the brown sepia, being for the most part the colour of the hair, gives it substance, because hair is very fine and difficult to work with, and it is very hard to get a good effect with so slippery a material. I have never been able to find out which of my great-grandaunts worked the little picture, so it will go down to posterity as the embroidery of one of the 'ladies of the family.' This is a work which it would be difficult to revive-still, it could be done by an enterprising worker-because it would lose interest if all the family were not represented; and, as I have said before, our brothers and our husbands have not the generous supply of material to draw from that their ancestors had, and in these days of curling-tongs and 'wavers' I doubt if the fair sex could contribute largely either. Still, the work might be worth trying, as it would be almost absolutely inexpensive. We ought to value any antique specimen of the kind we possess all the more, seeing that it is an art which will probably never be revived unless a turn of Fashion's wheel brings us back to the flowing locks of the Cavalier or the thick queue of the 'days of the dandies.'

THE EVERLASTING GODS.

THEY reign, the everlasting gods,
Afar on immemorial heights,
To scourge us with their scorpion rods,
To steep us in divine delights.
They are the everlasting gods.

Theirs is the barren blue of skies
Beyond the range of storm and wind;
The darkest of our mysteries
Is but a jest to them, who grind
The stars to powder in the skies.

Theirs are the palaces of dreams,
Upreared on clouds we dimly trace
Athwart the sunset's slanting beams:—
And only by their royal grace
We see those palaces of dreams.

Is it because they tire of Time
Who have no need of Love or Hate;
In realms eternally sublime
They weave for pleasure human fate,
Relentless throw the dice with Time?

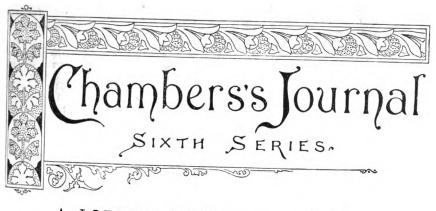

Beyond the whirlwind and the flood, Unmoved by revolutions dire, In some uncomprehended mood, They loose the lightning's glittering fire And give it human flesh for food.

Or is it sometimes they forget, Beyond the reach of mightiest wings, How high above us they are set, Hearing but as faint murmurings Rarth's litanies beseeching yet?

Till centuries of prayer seem vain, Incense and praise of no avail; Dynasties rise and fall again, Imperial godhead grows not pale, Perennial power doth not wane.

The everlasting gods survive,
Upon their knees our fate is set;
They know indeed we breathe and live,
Theirs is a higher justice yet,
For our transition they survive.

Ours is the Soul which godhead shares
With them: when freed from hindering breath
The spirit transcendent glory wears.
The gods weave fate—but it is Death
Crowns us with coronals like theirs!
(C. FARMAR.

A LITTLE TOUR IN SPAIN.

By LORD RONALD SUTHERLAND GOWER.

PART I.

FIND that in the book called Records and Reminiscences, which is an abridgment of My Reminiscences and Old Diaries, all that portion relating to my tour in Spain in the autumn of 1870 has been approximately as the second

of 1879 has been omitted. I have therefore thought that it might be of some interest to rewrite my account of that tour, taken from my diary of 1879.

September 26, 1879.—Left London by the tidal train. With my usual luck, I had a most perfect passage, and never do I remember thinking the sea of the Channel so gloriously beautiful; it was a darkly, deeply beautiful blue like the Pacific; and the sun setting in the dark purple waste of waters, against which microscopic-looking sails were seen, was more like something on the stage than what one generally looks on from the deck of a Channel stance. A glorious moon was shining over Paris; the bright magnificence of the other struck me more than while driving from the station past the Opera and the electric-lighted boulevards.

Saturday, 27th.—All the afternoon in the studio.

The 'Hamlet' is now cast, and looks as it should look. Now begins the 'Falstaff;' with his jolly old face and huge paunch he will be a contrast to the other.

28th September.—Spent the afternoon over Falaff. I think he will be a success, as far as I can
juige; but I expect people will say that so large a
juige is to prove the support of the working classes, waiting for the

for the arrival of the amnisties. Among the crowd were many women in red shirts, rattling baskets in which coppers were being dropped aux secours des amnisties; and very ill-favoured youths and men were hawking about a little red-covered pamphlet inscribed Le Diable Rouge, and sold for the same laudable object. It seemed strange to see soldiers and priests passing in and among this crowd of sympathisers and relatives of their bitterest foes. The papers are full at the same time of the Comte de Chambord—whose fifty-ninth birthday this is—and a number of banquets (fourteen alone in Paris); and an immense gathering under the old oaks in the park at Chambord to-day celebrates the birth of the 'Child of Miracle.'

30th September.—A long day on Falstaff. A lucky thought struck me—namely, to raise his fat fore-finger of the left hand, and place it near his jolly red nose; this has animated his fat form considerably.

On the 1st October I left Paris for Spain with an American friend and his old French valet Joseph. We arrived on a gray, wet morning at Bordeaux the following day, halting there for a hasty breakfast, and then sped on through a wooded but unpicturesque country under torrents of rain to Bayonne, and thence to Biarritz. We are at the Hôtel d'Angleterre, a large building in the Louis XIII. style, full of Russians. From my windows I can distinguish the graceful line of the Pyrenees, purple against the gray sky. At Biarritz I met Mr Goschen (afterwards Lord Goschen), with a youth named Gray who hailed from Dunrobin, and was acting as tutor to young Goschen, a lad of thirteen. I had not seen Gray since he too was a lad at Mr Fraser's school at Golspie; he is now a strapping, fine young fellow, and has distinguished himself at Oxford, and is likely to get on well in the world. Mr Goschen, whom I met after my sea-bath, spoke very highly of him. We left Biarritz at noon, and in a couple of hours were in Spain, having an hour's wait at Irun, where our luggage was searched. Arriving at Burgos, we drove in a tumble-down old car to our [All Rights Reserved.] MARCH 9, 1907.

inn, the Fonda del Norte—very old-fashioned and poorly furnished, but tolerably clean. We had to make terms about the price of rooms, and it was quite a sight to see three maids and several railway porters sitting on the stone stairs with tallow dips in their hands, waiting until this should be decided. 'Est-il concevable,' groaned old Joseph, 'que de telles choses peuvent arriver dans un pays si près de la France?' I must add that the scenery after leaving Irun is most striking, the line running between wild rocky hills which looked weird and fantastic under a brilliant moon; jagged rocks took the forms of enchanted castles under this light. Certainly our first view of Don Quixote's country was not at all a disappointing one.

4th October. - Up early, and drove in a shandrydan vehicle pulled by a couple of mules some two miles out of the town to see the 'Cartuja de Miraflores,' where in an insignificant and half-ruinous church the superb tombs in alabaster of the parents of Isabella the Catholic, Don Juan II., and of Isabella of Portugal would be in perfect preservation were it not for the desecration of the French soldiers in 1812. They are a marvel of intricate and elaborate workmanship, but they lack the dignity of simpler monuments; and my thoughts turned with affection to that plain, but I think more beautiful, monument in the church at Trentham. There is some good carving on the entrance-door of the chapel which contains the royal monuments, but nothing can exceed the melancholy look of the decayed and neglected cloisters. The only living person we saw was an old priest bowed down by eighty Spanish summers. Our next expedition was to the famous Cathedral, which has certainly not been overrated even by Théophile Gautier, who wrote that it so profoundly discouraged him with all the moderns, himself included. Grand, vast, and magnificent is this Cathedral; but what a fatal fault to block up such a building with the heavy coro (choir), which shuts out the proportions of the church more than in any of our cathedrals! We also visited the chapel containing the monuments of the Constable and his wife, as well as the other chapels, also the cloisters, and gazed on the Cid's coffer, which seems suspended like another Mohammed's coffin between earth and heaven.

Poor Joseph had a misadventure after we left Burgos for Madrid. Owing to his having a second-class ticket, he could not go with us in the express train, which is exclusively first class; and he started by a train which left Burgos for Madrid at five P.M., while we left by the eleven P.M. train. Poor Joseph had the bad luck to get a severe shaking, his train buraping into some trucks; and when we saw him buraping into some trucks; and when we saw him at Madrid next morning he met us with bloodshot eyes and the news that he had had to leave my portmanteau on the road. However, it has since turned up, and Joseph's eyes have resumed their wonted colour.

We travelled through the night in comfort, having a carriage to ourselves. When I awoke at

seven on Sunday morning, my eyes lighted on a scene I shall not easily forget. This was the town of Avila. The brightest morning-sunshine blazed on the yellow towers of its churches and showed off in splendid relief the rows of towers along its old walls; beyond, the ragged, bare rocky hills lay all purple and blue, with their outlines marvellously clearly defined against the azure sky. I had more than half a mind to stop at Avila; but, not being alone, I felt it would hardly be fair to my compagnon de voyage, who was dying with impatience to reach Madrid; and perhaps, as is often the case, that passing glimpse of Avila will leave a deeper and pleasanter impression behind than it would had I toiled amongst its streets and visited its churches.

In another two hours the Escorial came on our view-not so terrific and gloomy a building as I had expected. It seemed, as one saw it from the carriage windows, like a huge and glorified hospital perched on the bare hillside; but of this place I shall hope to have more to say later on. As usual in this country, our train was over an hour late, and we reached Madrid at ten instead of at nine. The glare had been rather blinding from the desertlike country we had come through since daybreak, and it was a relief to get into a room once more. We went to the Hôtel de la Paix, where from the balcony of my window I can see all the life of Madrid passing to and fro below on the Puerto del Sol, which G. A. Sala has likened to a glorified Seven Dials.

My first visit was to the picture gallery, and after a second visit I can form a good general opinion of it. The gallery is badly lighted and worse arranged. It contains much trash, but of course the portraits by Velasquez (which do not exceed my expectation) make, as every lover of art has said and felt, the trouble of coming here well worth undertaking; but the Murillos, except two, are not of his best—for such I must wait till I get to Seville. My friend went to a bull-fight, and came back, I am glad to say, quite sick and disgusted with the bloody and disgusting spectacle. Joseph, who accompanied his master, was equally disgusted.

6th October.—Visited the collection of armour near the palace, in the square of which the guard were trooping the colours. Unluckily, we only learnt too late that had we entered the palace we should have seen the king on his way to Mass, when, or after which, he was to receive the new Papal Nuncio. Not knowing this, we missed a sight that would have delighted my friend's heart, who, like most Americans, is very anxious to see a king. The armoury is splendid and most interesting, but not so striking in effect as that in Turin, owing to its being in a poorer building, or so rich in quantity as that at Dresden. We passed the afternoon in the picture gallery, and I have invested in various excellent photographs of some of my favourite paintings of Murillo and Velasquez.

lt was a wet afternoon; but they say it has not mined here for nearly two months, so it will please somebody.

7th October.—Wet; but it became fine in the afternoon, when we walked up the Prado, a feeble imitation of the Champs Elysées, again to the Maseum of the Prado. I think I can now give an account, were it needed, of all the most remarkable paintings in that collection. We also visited the Museum of San Fernando, which contains three superb Murillos; that of 'St Elizabeth and the Lepers,' formerly in the Cathedral at Seville, is a most glorious creation, but I doubt whether I do not consider the unpleasantness of the subject a drawback, and the 'Prodigal Son' at Stafford House superior to it. At Christmas, a year ago, I was shown a little sketch of St Elizabeth which the owner rowed was the original study for this picture. The one here is in a bad condition.

8th October. - We started for the Escorial at seven this morning. It was a beautiful day. We arrived at ten o'clock; walked up the hill; breakfasted at the very clean and decent inn close to the palace, which we afterwards saw thoroughly; not leaving it until we had been to the top of the tower where hang the bells, and down into the imperial vault where rest Charles V., his son and descendants, and about which so much has been written. Although and disappointed with the place, I cannot say that it came up to my expectations of gloom and solemnity; the royal vault is neither as gorgeous as the Chapel of the Medicis at Florence nor as impressive a the imperial tomb-house at Vienna. The chapel immediately above the vault is certainly very grand, and recalls St Paul's and the great hall at Castle Howard. What seemed to me most striking and interesting were the rooms in which lived and died that wretched bigot Philip II. The finest works of art in the Escorial are the kneeling bronze teres, on either side of the altar in the church, of Philip and Charles V., with their queens. The ibary is a noble and splendid room, and worthy of Fontainebleau or the Vatican. On the whole, the Recorial has not the air of desolation attributed b it; on the contrary, I think the view of the at the back of the palace and the valley in hont of it, although wild, not unpleasing; and I ould grow very fond of the arcades and the long eraced gardens with their well-trimmed box-

We also visited the exquisitely fitted-up little Traton.jike villa of Charles IV. near the station, which deserves more praise than travellers have belowed on it. Unluckily it is now allowed to fall into decay. Nothing can be lovelier than the true of little rooms in this miniature palace, each again in itself, the walls covered with the rarest true.

34 October.—We began a very long and interexing day by leaving our hotel at half-past six, before the sun had risen high enough to throw its

full glare across the Puerta del Sol. A long drive to the still unfinished Toledo station, followed by a long and wearisome three hours in the train to Toledo, across a country the desolateness of which it would be impossible to equal, I imagine, outside the Sahara; but the sight of the grand old town crowned with walls and towers, and the Tagus (the only river we have seen since leaving France) winding below, made up for the fatigue of the journey. We jolted up the steep street in a car drawn by six mules, across the double-gated bridge (a most picturesque structure), then up a winding road past the famous Moorish Puerta del Sol, and through streets so narrow that there was barely room for the machine to pass, and at length we reached the courtyard of an inn called the Fonda del Line. We felt grateful, on seeing this fonda, that we should not have to pass the night within its

After breakfast we sallied forth, and, under the conduct of a guide who spoke French, we visited in between two and three hours the places of most interest in the town, beginning with the Cathedral, which is less original than that at Burgos, but richer and more grandiose in detail-it is, in fact, somewhat overcharged with carvings and splendid tombs; banners which floated from the Spanish vessels at Lepanto deck the walls, while in a score or more of chapels, one more gorgeous than another, hang cardinals' hats over where their bones rest. It is like a cathedral that one dreams of, or reads about in a romance, or sees on the stage. We plodded through the hot, narrow streets to the Church of El Christo de la Luz, once a Moorish mosque, to Santa Maria Blanca, and El Transito, and others, all of great interest. What gave me the greatest pleasure were the cloisters of the Church of San Juan de los Reyes. These cloisters are, although a third-part in ruin, perfectly beautiful, and gave me more delight than anything I have seen since leaving my old elms in the Long Walk at Windsor. We also visited the newly restored Alcazar, noble and grand; its fine court, with a copy of the statue in the museum at Madrid of Charles V., and its carved gate; and also the ruins of the hospital of Santa Cruz, a mere wreck, but with a glorious entrance-gateway and stairs in the inner court. At five o'clock we had to be in the Grand Place, to return to Madrid, which we reached at ten that evening.

10th October.—A long and last visit to the museum; and also revisited the only other collection that is worth seeing in Madrid, that of the Royal Armoury. The king's guard was parading in front of the palace. We visited the Buen Retiro, crowded with people driving in their smart carriages in the evening coolness of the dying day.

11th October.—Left Madrid at eight A.M., and passed the day at Aranjuez. I was curious to see a place that Velasquez had painted in his rare landscapes, and the gardens in which, after Versailles, more Court scandals and intrigues had

taken place than perhaps in any other. We reached Aranjuez at eleven, and after breakfasting at the Hôtel des Ambassadeurs, close by the modest, single-storied, whitewashed house in which the Empress Eugenie lived with her mother long before any idea of Imperialism had dawned on her. We visited both of the palaces-first that pretty royal folly, the Casa del Lasbrada, with which I was disappointed - but, as Théophile Gautier truly observes, most palaces as well as courtiers resemble one another; but there is one room in it which is worth seeing, the China Cabinet, in which the walls and ceiling are lined with Buen Retiro porcelain. The gardens, especially the older parts, in which is the fountain painted in one of Velasquez's pictures, and the fine old English elms brought from England by Philip II., are worth seeing. Quaint and Easternlike were the camels solemnly parading these neglected gardens, doing the work that donkeys are put to in more northern plaisances. I was now and again reminded of the gardens at Trentham; not, however, that any comparison is possible between them. The finest thing in these gardens are the superb old stone-beeches, which I am sure if my dear mother had seen would have been introduced in the gardens at Trentham and Cliveden. We left Aranjuez at eleven that night, after watching a display of fireworks in the square near the church, and travelled through the night to the south. In the early light of the following morning we saw the picturesque country described in Don Quixote. We crossed a splendid gorge at Venta des Cardenas not unlike the American Rockies; but this part of Andalusia is still more savage and desolate.

12th October .- We arrived this morning at Cordova, hot, tired, and dirty. My first visit was to the Cathedral, an extraordinary and most interest-I could not, however, get the ing building. Brighton Aquarium out of my head. Here the destruction caused by the Spanish pagan Christian is appalling. What histories could not those thousand columns tell could they speak! Architecturally, this church-mosque is the object most worth seeing I have yet set eyes on in Spain. I was charmed, as I suppose every one must be who has eyes in his head, with the court full of orange-trees, its fountains, and graceful palms. I remained in the Cathedral to hear the evening service; it was fine, but there was no congregation but the officiating priest and some acolytes. Cordova is a most puzzling place to find one's way in; the narrow, tortuous streets, with the uniform whitewash on their houses and walls, show one no landmarks; and but for a little boy, who kindly showed the way to the hotel—the Hôtel Suisse, which is a good one, with clean rooms and a marble court and staircase -I should probably have been still wandering in

13th October.—At Seville. As far as Spanish pictures are concerned, I can now sing 'Nunc Dimittis,' having seen all that Madrid and Seville

have to show. To return to the itinerary of our route, we left Cordova at noon on the 13th, after revisiting the Cathedral and crossing the old bridge, from which one gets the finest view of the town. We arrived at Seville at six P.M. A heavy fall of rain met us, and the streets were covered with large pools. We had unluckily settled to put up at the Fonda de Madrid, which we found impossible, and we accordingly left it the next day (14th October) and went to the Quatro Nationes, on the Grand Place, which we found to be an admirable hotel, clean, and with good food, and where I should gladly have stayed a month, but two French acquaintances we met at Toledo, Messieurs de Treville and Gosselin, had made us promise to meet them at Cadiz and make an expedition with them to Gibraltar. However, one can see a great deal of a place in a couple of days, and we have already seen the Cathedral, by far the finest in Spain; the Alcazar, a most beautiful, quaint, and interesting building; the so-called house of Pontius Pilate; and the tobacco manufactory. The latter was a picturesque sight, full of colour, such as John Phillip would have delighted in painting. I wonder that he never put on canvas some groups of those hundreds of brightly clad, black-eyed women working at their task in the long whitewashed corridors of that immense building. It would have made a companion picture to Velasquez's 'Tapestry Workers' in the Madrid gallery. This morning I looked down on Seville from the gallery beneath the green old bells on the Tower of the Giralda, and below lay all the town, a great mass of buildings. The whitewashed houses were almost blinding to one's eyes in the bright sunlight. The Cathedral, in its vastness, its height, and dark grandeur, recalls Westminster Abbey, although methinks not to compare with the northern minster. The more I see of these continental churches the firmer is my conviction that Westminster is of all Christian churches the noblest and most impressive. The High Mass is well performed in this Cathedral; the organs are glorious instruments, and of great scenic effect with their long jutting-out gilded pipes, which seem to me foreshadowings of the Last Great Day and of the great awakening! I returned in the afternoon to the Cathedral to hear the afternoon service. We were assailed by a crowd of choristers in the nave, who demanded cigarettes of us-a cheeky crew!

cheeky crew!

16th October.—We left Seville in the afternoon for Cadiz. I shall not readily forget an effect of sunset we had seen after leaving Lerey, where we arrived two hours behind time, our engine having broken down. The western sky a wild sea of saffron colour crossed with pomegranate-coloured clouds, the foreground to this glory of colour a deep-brown land, with dwarf stone-pines standing out black against the glowing western horizon. On arriving at the station at Cadiz we were met by our French friends De Treville and Roland Gosselin. That night we embarked on board a Spanish vessel,

where we passed the night, and steamed away early the next morning.

17th October.—We left for Gibraltar. The morning was hazy. Cadiz appeared better from the sea than from the land. A long row of glistering white buildings, crowned by a lofty brown cathedral, with a great sweep of sky and sea above and below. One thought of Essex's fine piratical feat, when he so effectually singed the King of Spain's whiskers some three centuries ago. It was four in the afternoon before we came upon the great rock of Gibraltar, like a huge lion couchant. We were not allowed to land on that historic eminence, for our

ship was bound for Algeziras, the small Spanish town on the opposite side of the bay. There we slept in a lodging-house of the most primitive kind. Augustus Hare has written of Algeziras as if it were an earthly paradise; but it is merely a small Spanish port with nothing to recommend it. However, the family of Nicolas Barbaro in the Plaza Paloma made one as comfortable as they could; there was the fat gudewife, with some rather dirty and improper-looking daughters, a niece, and a sick husband, whom his family insisted on our interviewing, although he was in bed.

(To be continued.)

THE LORD OF THE MANOR.

CHAPTER XVI.

ITH a spontaneous gesture, Angela held out her hand. It was a brave and generous confession, and the girl felt all the better for it. There was a deep, admiring light in

Warrener's eyes as he held the dim fingers in his. He knew what an effort the words cost.

'You can't tell how glad I am to hear you say that,' he said in a low voice. 'You are ready for the sacrifice; but the blow shall not fall if I can prevent it. I shall come and see you this evening, if I may; I shall have something to say to you.'

Angela smiled and coloured. She had forgotten all about her troubles for the moment. The sun and the shadows chased each other across the Common; the breeze was fresh from the sea. Angela's step was light and springy as she turned let face towards home.

All the same, it was a monotonous morning that followed. The patient awoke a little before midday and took some food. He was obviously better for his long sleep; he managed to articulate a few words with difficulty. He seemed anious to know if Miss Castlerayne was there; he seemed to be relieved by her presence. Marfell was frankly pleased. The recovery was only a question of time, especially if the source of the buddle could be moved.

Luncheon was ready on the table when Mr Summers arrived. He had heard casually in Hardbrough what had happened, and had come over at once. There was a repressed air of excitement doct him that was very unusual in the decorous diffamily attorney. Subject to the doctor's approval, he had a proposal to make to his unfortunate client. Perhaps Miss Castlerayne would sad for the doctor after luncheon.

There is really no necessity, Mr Summers,' legels said, 'If you have anything calculated to take my father's anxiety of mind you need not beside to tell him what it is. His mind is as claras yours or mine. Dr Marfell would welcome

anything calculated to ease his anxiety. But it can't be possible that there is any chance'—

'My dear young lady, nothing is impossible. Money flies in strange fashions; it comes in the same way. The wealth of the world was more or less started by a genius who watched a kettle boiling. There are different kinds of diamondmines at the back-door of all of us, if we had the sense to know it. I shall be glad to see your father as soon as possible.'

It was Angela who escorted Summers to the invalid's bedroom. Miss Castlerayne would have done so had not May mentioned that the task should be Angela's. She whispered that there was the beginning of the unfolding of the great secret. But Angela took no heed. She was glad to see the gleam of recognition in her father's eyes as Summers entered the sick-room.

'I'm going to talk to you,' Summers said. 'I can see that you are perfectly capable of following me. If you had taken my advice the trouble would have been saved. Still, it really does not matter, seeing that you are in a position to clear off all your liabilities in a day or two. If you are quite agreeable, we will get rid of Craggs's claim at once. I've telegraphed the Deputy-Sheriff to see me here at three o'clock and get his cheque.'

Angela fairly gasped. It was the old miracle of the unexpected again. Castlerayne's hand moved to his head and then fell again. He essayed a smile.

'What does it mean?' Angela whispered. 'Mr Summers, what does it mean?'

'It means nothing at all unless you restrain yourself,' Summers said severely. 'If you unduly excite your father I shall have to turn you out of the room. It is very irregular for a third person to be present at an important interview between solicitor and client. It means, in plain English, that I have had a good offer—a splendid offer—for the waste land between the high-water mark and the hills that lie on the far side of

the hospital. There are about two hundred acres of this land altogether, and I have been offered fourteen thousand pounds for them. As for some years I have been authorised to accept as many hundreds, I closed with the offer. The purchaser is a rich man, and he paid the deposit to-day. He stipulated that the transaction should be completed in a week, and there is no reason why it should not be so completed. The cheque he paid me will more than satisfy the claim of Cragge's solicitors, so that in a short time you will be rid of your skeleton in the butler's pantry. Within a few days all the creditors will be paid, and you will save your family treasures. But so far as I can see, it would be wise of you not to try and keep up The Towers any longer.'

'Who is this madman?' Angela asked in a voice that shook strangely. 'Who is the dreamer who offers all this money for that waste land?'

'Oh, he is no dreamer,' Summers laughed. 'He is a fine business man, and you may be certain that he is not going to throw his money away.'

'But it sounds so like an act of magnificent charity on the part of some friend'

'My dear young lady, tell me the name of any friend of yours who is in a position to indulge in such an act of magnificent charity. I tell you the purchaser is one of the most successful business men in England. He is speculating. As frequently happens in such cases, he does not wish to have his name declared for the present. Be satisfied that he has saved your good name and lifted the trouble from your house.'

Something like a smile passed over the face of Rayne Castlerayne; it was quite evident that he had followed every word with the closest attention. The white, strained look had gone from his face. He gave a long, contented sigh, and closed his eyes. The obvious suggestion was that he left everything to Summers. A moment later and a sound of his regular breathing could be heard in the room.

'He is asleep again,' Angela whispered. 'Let us go and discuss the marvellous change of affairs with the others. I can hardly believe it yet.'

Miss Castlerayne cried placidly as she listened to Summers's dry recital. The story washed the last drop of bitterness from her cup. She had saved the hospital without doing the least harm to the fortunes of the family. May laughed; there was a strange glitter in her eyes. In some vague way, Angela decided that May knew all about it. She expressed no astonishment at Summers's amazing story. The butler looked in presently with the information that somebody had called to see Mr Summers on business. With a quiet air of satisfaction, the lawyer called for pen and ink, and he produced a cheque-book from his pocket. He came back from the library presently with a smile of pleased contentment.

'The skeleton has gone,' he said. 'The skeleton's

employer has taken nearly twelve hundred pounds that might just as well have been saved; but it is no use to cry over the milk that has been spilt. I am going to take the liberty of settling my esteemed client's affairs for him, seeing that he is incapable of doing so himself, which perhaps, in a way, is not altogether a misfortune. In a few days I shall have the balance of that purchase-money in my possession. If you will supply me with a full list of all the claims, Miss Castlerayne, I will discharge them at once.'

'Oh, indeed, I will!' Aunt Gertrude laughed and cried in the same breath. 'Oh, the peaceful heaven of being absolutely out of debt! I can't realise it yet. And if I could go down on my knees and thank this unknown benefactor of ours'—

'He would feel very awkward,' May smiled.
'Mr—I mean the gentleman in question—may not be such a benefactor after all. He may spoil the place; he may start some dreadful manufacture there—say, for instance, soap. I did not mean that. I'——

May paused in some confusion. Angela shot a keen glance at her. May had evidently known all about this from the first. A flash of illumination came to Angela. All her tenderness and self-abasement had vanished; her pride was in arms once more. She knew everything now as plainly as if May had told her. The first suspicion had been correct. She crossed over to the window and looked towards the Common, soft and tender in the sunshine. It had been bad enough before; it was no better now. What did it matter whether the family had a host of small creditors or one large one, generous as the latter might be? And as if any girl worthy of the name was likely to be dazzled by ostentation like that! Angela was feeling very hard and bitter at that moment.

She was glad to be alone presently. May had gone as far as the hospital after tea, and Miss Castlerayne was sitting with the invalid. He had managed to ask for a cup of tea. Angela had strolled into the garden, where a few late roses were blooming still. The amber light of the slanting sun was on her face; it seemed a very fair one to Warrener as he came up the drive. His head was high; he seemed to be on the best of terms with himself.

'You told me I might come,' he said. 'How is the invalid now?'

'The invalid is much better,' Angela said coldly.
'A wonderful thing has happened. A purchaser has come forward and bought some of the waste land behind the hospital. It appears that he has paid about four times as much for it as the whole estate is worth. Mr Summers told me so. He has paid enough absolutely to clear us and leave us something besides. The skeleton has gone, and my father is so much better that he was able to ask for a cup of tea. And for all this we are indebted to the generous charity of Mr Cliffort Warrener.'

The attack was so swift, so cold, and so unexpected that Warrener was thrown into confusion. His face hardened a little as he noted the clear, metallic brilliancy of Angela's eyes.

'Will you be so good as to be a little more explicit?' he said.

'Why fence with me?' Angela cried. 'I know that you are the purchaser. May could not disguise her thoughts; she was in the conspiracy. A few words of hers betrayed you. Mr Warrener, is this thing kind or generous of you?'

'Generosity has nothing to do with it. What do you complain of?'

'Of the whole thing. Why do you humiliate us? Why do you come here like this, making a display of your wealth? You may think it very clever to trap us like this; but the result is just the same. You might have left us our pride. We were going to sell everything and leave The Towers. The hurt of it would have softened. And your scheme is so transparent. Nobody in their senses would give a tenth part of what you gave for that poor land. I can't recognise it as anything but another form of charity.'

The words came rapidly from Angela's lips; she stood there with the sunshine still full upon her beautiful, haughty, angry face. Yet there was a

pathetic droop of her lips, a suggestion of a plea in her splendid eyes. Warrener was obviously restraining himself.

'You are quite wrong,' he said; 'and you will be bound to admit it when you know everything. And there is no suggestion of charity about what I have done. I am going to make twice the money out of my purchase, regarded as a fine business transaction. If that land had been the property of a total stranger I should have been quite as eager to get it'—

'Stop, before you go any further. Would you have offered as much money for it?'

An angry red flushed Warrener's face. He could not stoop to lie. Angela had hit the one weak spot in his argument. He waited for her to go on.

'I see it is exactly as I say,' she resumed. 'I dare say you mean well. But if you think that your money is a sure and certain way to a girl's heart, why'——

It was Angela's turn to pause in confusion. The cruel scarlet flamed over her face; tears of vexation rose to her eyes. Oh, what must he think of her? By way of reply, Warrener raised his cap, and, turning on his heel, walked slowly from the garden.

(To be continued.)

'THE NEW AGRICULTURE.'*

By WILL H. OGILVIE.

MERICA in late years has done more than any other country, not even excepting Germany, to advance and develop what is generally known as the 'new agriculture;' and therefore it is antirely ex-

fore it is entirely fitting that from amery of recent achievement in the agricultural world.

The subject, from its very vastness, is one which requires some courage to approach; and though Dr Brad Collins confines himself mainly to what has ben done in the United States, that huge territory of such varied conditions and capabilities is surely sufficient field for any one man to handle. Dr Collins has brought more than courage to the task. He writes with knowledge and acumen, with breadth and understanding, with very considerable literary shillty, and with a sympathy that is always shrewd than sentimental.

Agriculture, to its foremost devotees, has become a sience; an exact science, however, as Dr Collins try properly points out, it can never be, dependent it is upon Nature and her variable moods for its itsence and encouragement. It is this breadth of possibility, this open field of enterprise, which con-

stitutes the greater part of the charm of a country life. In the cities we are moulded on a pattern; our individuality is sunk in the particular line of business which we have made our own, and which has been found most profitable by thousands before us. Farm-life gives room to our individual aspirations, encourages us to explore new bypaths and invent new machinery by the aid of which Nature may be induced to uncover for us new treasurehouses of profit and delight. For this reason every year presents us with material for another chapter in the book of 'new agriculture.' The writer of this volume, then, has found no lack either of motive or of matter, and his achievement is one of the most notable in modern agricultural literature.

The chapters of this very interesting book are headed in a manner which serves to accentuate its ruling characteristic: novelty of method. Thus we have such headings as 'The New Call to the Farm,' 'The New Soil,' 'The New Fertilisation,' 'The New Transportation,' and so on; the book ending fitly with a well-written chapter on 'The New Inspiration.'

In the first chapter—that dealing with 'The New Call to the Farm'—the author states the position of the modern agriculturist in a few well-chosen words: 'We are at the beginning of an era wonderful in the annals of agriculture—an era in which experiment and foresight and skill and

^{*} The New Agriculture, by T. Byard Collins (New York : Mann & Company).

invention and learning will transmute, as never before, the labour bestowed upon the land into wealth and health and happiness and length of days; an era of progress and development as wonderful as any that has hitherto astounded the world in other departments of investigation and endeavour, in which agriculture will for progress take her stand side by side with the industry of shipbuilding, for instance, which has within a comparatively few years reduced the time for crossing the Atlantic from three months to less than twice as many days, and increased the carrying capacity of single vessels from a few hundreds to many thousands of tons; by the side of railroading, in which speed and safety and capacity have, in each succeeding year, laughed at the impossibilities of the year just gone; by the side of electrical development, which, from a meagre beginning of a generation ago, now renders us speechless in the presence of its phenomena of light and heat and power and other manifestations still more subtle and marvellous.'

Of the great agricultural colleges, which play such an important part in the United States to-day, he says: 'The different states of the Union, seeing the importance of technical training among the farming community, have provided colleges for this purpose, which now dot the land in all its sections. These schools are surrounded with ample farms, in which practical demonstration goes hand in hand with the theories taught and the facts acquired in the class-room; they are provided with improved buildings, in many cases ideally adapted to the purposes for which they were constructed; they are granted large means for the prosecution of their work; they are equipped with precise instruments and all the paraphernalia requisite for the successful prosecution of scientific investigation; and they are manned by scholarly and competent men, who are imbued with the importance and the possibilities of their positions.' We should have been glad to hear an authority so obviously well qualified as Dr Collins go rather more deeply into the whole subject of agricultural education than he has done in these pages; but agriculture is a topic presenting so many different sides that one aspect or another had to be overlooked if the resultant volume was to be kept within reasonable compass.

Tracing in a wide and general way the extraordinary advance of agricultural method in recent
years, our author emphasises in this first chapter
the insistent call of the country and the growing
response of the cities. He shows us something of the
claim that Nature in her green fields makes upon
us all, and something of the reward which she gives
to those who devote their lives to her aid. He tells
us something of the general march of science in
agriculture: how the wizards of plant-industry—
men like Webber and Burbank—have waved their
wands over orchard and garden, and evolved new
shapes, new perfumes, and new colours; how plantpests and animal diseases which were once the

terror of the farmer are now subject to control, and give him little more than passing concern; how the extraordinary accuracy of present-day weather predictions has given the farmer an advantage which cannot be overestimated; and how school facilities, labour-saving machinery, and a more attractive social life have made farming the most desirable

of all industries. The next chapter, which deals with 'The New Soil' and with irrigation, is a very interesting one. Nothing in the agricultural records of North America is more fascinating than the history of irrigation and its results in the semi-arid regions of the west and south-west of the United States. In northern New Mexico and in parts of Arizona may still be seen the remains of irrigation-works built by a civilisation which centuries ago perished from the earth. The Pueblo Indians may still be found irrigating their little patches of tillage just as their ancestors were doing at the time the first Spanish explorers passed through their country. The beginnings of Anglo-Saxon irrigation seem to have been made in Utah, where in July 1849 the little band of Mormons, camping in the Salt Lake valley, turned the waters of a stream afterwards known as City Creek upon the parched and barren soil, and planted there their last stock of potatoes in the hope of raising a crop which would save them from starvation. Twenty years later the States of Colorado and California had become aware of the vast possibilities in this branch of agriculture, and incorporated companies were formed which planned immense undertakings undreamed of by the pioneers of the movement.

By this organised conservation and distribution of water, every inch of land hitherto barren became productive. Every year vast areas of virgin land are reclaimed from the western prairies and the foothills of the Rocky Mountains, and turned into flowering gardens by the gift of the life-giving mountain-water. As Dr Collins says: Irrigation reduces agriculture in the semi-arid portions of this The irrigator country to a scientific certainty. argues that, besides being more satisfactory, his water-supply is cheaper than natural rainfall. He calls attention to the frequency with which drought in the middle and eastern states reduces the crop to half a yield. If the value of the full crop would have been but twenty-five dollars an acre, then the loss per acre is twelve dollars fifty cents. What would the farmer give for a sufficient water-supply to secure a maximum crop? Certainly ten dollars an acre. But the irrigator gets his for two dollars an acre, and besides he has constantly the satisfaction of knowing in advance precisely what he may depend upon, both in supply and results.' On irrigated farm-lands in the western states, and particularly in California, some astonishing yields have been reported. Eight tons of alfalfa and five tons of timothy and clover have been mowed from a single acre during the year. An acre in potatoes will yield thirteen tons, and an acre of orchard will bear twelve tons of product. Onion-growers have raised as much as six hundred dollars from a single acre. In the light of these facts, the lonely figure with the hoe, whom the present writer has pitied at his daily toil in the Rocky Mountain valleys, as he stood ankle-deep in water, guiding the water from the ditches across his land, is not such a subject for compassion after all.

In the chapter on 'The New Fertilisation' Dr Collins is at his best. It is the man of science talking to the farmer and the general public in a way which they can understand. Nothing in agricultural economy has changed more in recent years than the attitude of the tiller of the soil to the soil itself. In a new land such as America, the tendency was to a belief that the earth required no artificial renewing of its strength; and even to this day there are many parts of the United States where the farmers never think of applying their farmyard manure to the soil, but cart it out upon the roadsides or give it away to any neighbour who thinks it worth his while to come and fetch it. The kientist, however, dissolving the plant into its composite elements, has long ago found out that nitrogen is the one which it is most often necessary for him to supply; and now that he has found it possible to sow certain crops which themselves absorb the nitrogen of the atmosphere, and under the action of the plough convey it to the hungry soil, the principal difficulty in the way of fully feeding his land is overcome.

In America, that land of vast areas and interminable distances, the question of transportation has always been a vital one. In the earliest days it was insufficiently answered by inadequate canals and roughly shaped roads; in later times attention was centred upon the birth of the railway system, and the roads and canals were neglected; later still, the rival railway companies found that their success depended upon attention to the approaches by which their lines were fed, and the question of how to make and preserve good roads has again become of attional prominence.

To this keenly interesting subject Dr Collins has contributed a chapter on 'The New Transportation'. In the western states the roads at any distance from the more important towns are still little more than prairie-tracks. There are 'glue-pot' places that remind the traveller of the notorious black soil plains of western New South Wales and Quensland. It is no uncommon sight in the little tountry towns of Iowa and Nebraska to see wagons attually trapped in the streets, bogged down to the alle-trees in a swamp of rich dark clay; and anythe wreks of buggies which have broken down the the streets of buggies which have broken down the tree deep.'

Dr Collins quotes the description given by Charles Dickens of travel by stage-coach as it was in Ohio in 1842: 'At one time we were flung together in a beap at the bottom of the coach, and at another we

were crushing our heads against the roof. The drivers on these roads, who certainly get over the ground in a manner which is quite miraculous, twist and turn the teams about, forcing a passage, corkscrew fashion, through the swamps and bogs. A great portion of the way was over what is called a corduroy road, which is made by throwing trunks of trees into a marsh and leaving them to settle there. The very slightest of the jolts with which the ponderous carriage fell from log to log was enough, it seemed, to have dislocated all the bones in the human body.' And the present writer, mindful of a recent coach-trip through the Colorado Rockies, can testify that that particular mode of travel has changed but little with the years.

Our author traces for us the continual progress in the building of highways and the construction of navigable canals, and shows plainly the renewed interest taken in this work since the first glamour of the railway's advent faded. As he wisely says: 'Good roads mean more money for the farmer. They mean the consolidation and betterment of the rural school; they mean the economic use of the farmer's time; they mean the manifold advantages hitherto enjoyed only by the residents of cities and towns; they mean social possibilities and the gratification of legitimate social desires; they mean freedom of movement and the daily delivery of mail; they mean self-respect and satisfaction with his mode of life; they mean the homestead to which the married children will return with pleasure and which the young folks will not hasten to desert.'

Of 'New Interests' the writer of this book speaks hopefully. Among ventures which have lately claimed the notice of the more advanced American agriculturist he names the growing of rice, the raising of Angora goats, the cultivation of figs, and the growing of tea. It appears that there exists in the United States to-day only one commercially productive tea-farm. It is known as the Pinehurst Tea-Garden, and is located at Summerville, South Carolina; it stands as an expression of the faith of Dr Charles U. Shepard in the possibility of American tea-culture. Tea has already been successfully grown in India, China, Japan, Formosa, Ceylon, Java, South Africa, and the Russian Caucasus, indicating the world-wide adaptability of the plant. Dr Collins claims that, with an annual American consumption of one hundred million pounds of tea, there is sufficient inducement for the American farmer to enter the everwidening market with the highest quality of this product.

Another new interest which he heartily advocates, and which he thinks has not attracted sufficient attention from the settlers of the Pacific slope, is that of perfumery-farming. In France and elsewhere in the Old World this industry has attained very large proportions—in one case, at least, a whole city being built up on the business. And where could one find a centre more adapted to this

industry than the rose-covered slopes of California? With an intimate and accurate knowledge of his subject, our author makes plain the commercial possibilities of a venture in this direction, and details the various known methods of scent-making.

Undoubtedly the most interesting and fascinating chapters in this most fascinating volume are those devoted to 'New Creations' and 'New Varieties.' Here we have the author at his literary and tutorial best upon a subject which, to all men and women interested in plant-life, is the most engrossing in the world. For many years a little band of devoted workers has been toiling unostentatiously at the most ambitious and most interesting of all branches of horticultural science-namely, the evolving of new shapes and colours and perfumes in the flowerworld by a system of selection. By chance, it may be, a white flower is found containing a single streak of crimson on one of its petals; by using the seed of this flower as a parent stock, Nature is, after a lapse of time, induced to evolve a flower of crimson in a family in which hitherto only white flowers were known. In this way there is hardly a limit to the plant-magician's power, and we are even promised-what has up to the present been looked upon as the most unbelievable of the fairy tales of science-a blue rose.

Of the men who are thus working hand in hand with a hitherto unaided Nature, none is now better known or more highly thought of than Luther Burbank, whose marvellous achievements are the wonder of the world. Dr Collins names among other creations of this wizard and his companions in art the white blackberry, the cactus fruit, the seedless apple, the pitless plum, the citrange, the pomato, and the tangelo. Nor are these mere useless and fanciful variations of well-known species, but they have been bred with the business-like intention of evolving varieties which shall gain in market value through certain economic qualities. These chapters are particularly well illustrated with cuts of fruits and flowers, and should be studied by

every one who takes an interest in the absorbing scientific byroad with which they deal.

A chapter on 'New Practice' is soundly written, and shows us the immense strides made in the economy of agriculture within the last two decades and less. The many improvements in dairying methods are particularly treated at considerable length, and the illustrations in this section are very clear and convincing. A book essaying to deal with the 'new agriculture' would, of course, be incomplete without a chapter upon the new machinery, and this our author supplies. America's agricultural machinery is the wonder of the world. There is scarcely a remaining phase of field-work which is dependent upon purely manual labour, and the Man with the Hoe is practically a thing of the past. Road-graders, ditch-diggers, disc-ploughs, manurespreaders, and all the complicated reaping, binding, and winnowing machinery of the Far West are comparatively familiar to most of us through illustrations; but one has almost to read Dr Collins's carefully prepared explanations, as set down in this chapter, before one fully realises the marvels of the workshops and the absolute triumph of man's ingenuity. It is questionable if any development of farming-machinery has been of such widespread and generally recognised benefit as the simple but indispensable cream-separator now to be found in practically every farmhouse in America where dairying is undertaken.

The last chapter of a most remarkable and valuable book is headed 'The New Inspiration,' and deals with the work of the meteorologists, of the chemists, and of the botanists, in their capacity as scientific assistants to the farmer.

Dr Collins has done his part faithfully and well, and has produced a standard work which sums up concisely and adequately the agricultural achievement in America throughout recent years; and we in Britain must perforce acknowledge that in agricultural progress and efficiency America leads the world.

ANOPEN DOOR

CHAPTER V .- DISCUSSIONS.

EFORE Sidney had been a month in Satong the community had come to the conclusion that here was the very man they wanted, and that it was a direct interposition of Providence that had brought

him to their shores.

'Why should he ever go back to England? Engaged to be married? Let the girl come out.'

And some of the residents hinted that they were willing to put their hands pretty deep into their pockets if money were a consideration in the matter.

At the Scotts' house there were many after-

dinner talks on the question as to whether a suitable man for the post could be found in England; but the church committee were very gloomy as to their prospects.

'I suppose if we wait long enough we shall get a man,' said one; 'but what kind of man? That's the question. Look at the chaplains in most of the port-towns in the Far East. You might put them in a bunch and you would not get as much energy as you would find in any ordinary missionary.'

'Yes,' chimed in Mrs Scott; 'if we could get some one who would put as much energy into improving us as the missionary puts into the conversion of the heathen, what a difference it would make!'

'There is no doubt,' said a churchwarden, 'that the missionary societies get some first-class men; you meet them all over India, China, and Japan. But when you want a chaplain, look at the men that offer!'

Sidney represented that first-class men were are anywhere, and not always to be found in England.

Yes, that's partly it,' said another; 'but if ever a good man wants to come out to these parts there is a howl from his relations, and they declare that he is needed at home. I know all about it, for I had a cousin myself who thought of going to Japan, and when he spoke of it there was such a dust raised by his people, and his bishop wrote and told him that men such as he were needed at home. I know, for I saw the keters; and so he gave it up.'

'Yes,' said Mr Stuart; 'I would not mind so much if they stayed at home to work among the poor and help them a bit; but that's not what keeps most of the men at home. It's the beastly edialness of the pious—that's what it is. There's a limited supply of good clergy, like other things, and the religious people in England say, "We have ant pick, and you take what's left," quite forgetting that we really need more help out here than they do at home. And the consequence is that there ar churches at home where there are three or loar clergy, and you can hear a good sermon morning, afternoon, and evening; and then look at us out here. We have had fifteen minutes of old Gray every Sunday for ten years, except when Roberts the missionary gave us a look in, or when the bishop came once a year.'

If they would even send us out some good peacher to go on circuit like a judge it would be senething. I believe that kind of thing is done sentines in India; but I never heard of any one triving in the Far East for the purpose of giving a apirtual stir up.

I suppose we are the stony ground on which to one cares to sow, said Mrs Scott.

Monsense, growled her husband; 'we are no sore tony ground than the unconverted Japanese or Chinese. But no one has ever raised a hand to tatter the seed.'

And think of the poor Eurasian children here, and Mrs Scott. 'I assure you, Arthur, that there are quite big children living in good houses who have never been inside a church in their lives. They are too proud to go to a mission church, and so one particularly invites them into ours, and they are too shy to come alone.'

They are heathen, if you like,' said Mr Scott.

They know nothing of Christianity, and have hot even got a smattering of Confucian morals.

These Eurasian children are growing up wild all over the Far East, and there's a bad time coming it England cannot manage to spare a few of her

really earnest men to come out and influence them. It would be a great help to the missionary cause, too, for the state of society here is a setback to the spread of Christianity, and a good deal that's not very creditable gets into the native papers.'

Sidney always held a brief for the clergy during these discussions, and yet he felt that his arguments as to why the clergy should not be eager to work among the white population of the Far East were very ineffective. The longer he was in Satong the less he desired to stay, and yet he was given proofs that his presence and ministrations there were helpful.

He was much touched by one little incident. It was his custom on Sunday afternoons to take a walk in the cemetery, a quiet, green spot, in which were names of many nationalities. One afternoon he caught sight of a white figure lying over a grave. It was a lady, who lay so still that he feared that she had fainted, so he went up and touched her. To his astonishment, she rose, and Mrs Travers stood before him, her eyes swollen as with violent weeping. She was a flighty, slangy woman, the leader in every wild escapade, looked upon by the Chinese servants with a kind of awe because of her dare-devilry, the very last person that he expected to find weeping beside a grave.

All your own fault, Padre,' she said, attempting to laugh; 'all your own fault! Why did you preach that sermon this morning about the Shunammite woman and the little lad who lay on her knees and died? It brought it all back so-the time when my little chap died on my knees. Yes, this is his grave. Such a little brick he was! I swear to you that if I had him now I would be a different woman. "Norman Travers, aged six." He was called after my father. Poor old dad! he lives in Devonshire. I write to him every mail; it's all I can do for him. It would turn his hair white if he were to hear of my goings on, so don't you let on if you should ever meet him at home. I took a fancy to you the first time I saw you, not because of anything you did or said, but because of a sort of way of looking out of your eyes that reminded me of the little chap. I had put his photo away; I could not stand it on the table; and then your face brought him up before me. Oh Padre, why were you not here when he died? Perhaps you might have played the part of Elijah, and entreated God for me; but there was no one to say even a prayer. You know how I racket about, Padre; it is just to escape from the house and from the empty nursery. I never look at them, but I know just how his little clothes are folded in the drawer—the velveteen suit and the lace collar, with the shoes on the top. I wake up in the night and I know that they are there; but I have not the courage to look at them, so I just racket round and try to forget. But I swear that I'll come to church as long as you're here. And you'll stay on, Padre, won't you?'

CHAPTER VI.-THE STRUGGLE.

TAY on !' Did it really mean that he, the popular Arthur Sidney, was to settle down at Satong for the rest of his life-in this hot, smelly place, where merely to pass

through the Chinese town gave him a sensation of horrible nightmare? Those high houses, with their dark interiors; the shops, at the doors of which lounged fat Chinamen, and from which issued all manner of weird smells! The people's faces, the sounds, the smells, all oppressed him, and seemed

suggestive of evil.

Had Sidney been an older man he would probably have gone to a missionary, and through him got acquainted with some of the simple, honest John Chinamen that are to be found in all large towns in the Far East. Nothing dispels a prejudice against a nation so much as getting to know and respect a few individuals. But there was no mission belonging to his own church in Satong, and Sidney did not care to seek out the only resident missionary, the Reverend Abel Jones. He was an earnest but uncultured man from one of the Western States. When he had heard of Sidney's arrival in Satong he came at once to see him.

'Glad to meet you, brother,' he said, grasping Sidney warmly by the hand. 'It is indeed the Lord's doing that you should have come at this You find a flock without a shepherd, and I trust that the Lord will greatly bless your ministrations. We will be instant in prayer for you.'

When the worthy minister had gone Sidney felt furious-not with the Reverend Abel Jones, whom he saw to be a single-hearted man and a hard worker; his anger was against himself. Why did his English reserve rear itself up in this way, and make it impossible for him to respond to the 'brother' or talk of 'the Lord's doings'? A difference in phraseology is a more effective barrier than a difference of creeds; and Sidney felt that all their lines of thought were so different as to make intercourse an effort rather than a pleasure.

The myriad life around oppressed Sidney, and it was but little relief to turn to his own countrymen. The English community consisted of a dozen or so of good, quiet people, who spent much of their time in thinking of children at home and longing for the time to come when the dollars would be sufficiently plenty to allow of their joining them; and after these there was a set of fast, worldly men and women with whom he seemed to have absolutely nothing in common. When the women were not deep in some wild scheme for 'killing time' they were generally to be found lying in long chairs, with

novels in their hands, complaining of the slowness of life. And when he saw them like this, Sidney's thoughts would fly to the women he had known at home: the gracious, cultured women, with their deep interests in the poor, in music, in art, in everything that was elevating; and he asked himself if he was bound to give up their society

for this. 'Yet what lives these poor things lead! What shall I myself be like after six years of Satong? After all, is not one's environment the deepest

factor in one's life?'

But after asking himself this question, Sidney would remember that as a Christian he was bound to the belief that man possessed a spiritual Guide who could lead him above all degrading influences of environment.

The weather grew warmer; a great lassitude seized Sidney, and the want of congenial companionship began to tell on his sensitive nature. The Scotts and others were most kind, but they had been a long time out of England, and their lines of interest were very different from his.

The Far East, with all its intricate questions of the Yellow Race, and its progress was their topic; but in the actual native life around them they took no interest. Man in the shape of the Chinese was to them nothing but a beast of burden; they had no belief in the oneness of humanity, for White Man and Yellow Man were to them as widely apart To Sidney man was as were man and beast. always a fellow human being; and though he could not repress a sort of shrinking from the Chinese, yet it enraged him to see a young bankclerk kick an elderly Chinaman in order to make him hurry up a steep hill with his rickisha.

'You'll stay on?' Some one was always saying it; and as the wish became father to the thought it became, 'Of course you'll stay! Why, confound it all! you are not going to leave us in the lurch?

The Scotts were placed in a difficult position. They wished Sidney to stay, and yet they knew what a bitter disappointment it would be to his people, who looked forward to a brilliant career for him, and they did not like to press the matter. But they felt that he was a stronger power for good than anything that they had yet had in Satong, and they could not but hope that he would feel that in a peculiar way he had been called to that field of work. The only doubt in their minds as to his fitness was the question of his health; for Sidney was looking pale and haggard. The perpetual debate in his mind was the worst thing possible for a man who had suffered from a nervous breakdown.

(To be continued.)

DOCTORS OLD AND NEW.

HE doctor is in evidence at our advent into this world, and it may be he shall be called to our exit; how often we shall see him between these, to us, all-important events may depend on the state of our general health. We

end for him in slight or serious ailments whether he can do much or little good, for there is a feeling of cowardly misgiving in the hearts of most in the presence of calamity, which is relieved or removed by reference to skilled authority. His advice and ministrations follow some from the cradle to the gave. Others, more fortunate, keep him at arm's-legth, and rejoice in doing so, although their day may come ere they shuffle off this mortal coil. The doctor is a true friend to humanity, who works long and hard for very little, and who deserves our gratitude and readily paid fees.

God and the doctor men adore
When sickness comes, but not before;
When health returns, and things are righted,
God is forgotten and the doctor slighted.

Two hundred years ago, and less, doctors purged and bled their patients in a way that would be thought barbarous to-day. Voltaire said of the eventeenth-century doctors that they poured drugs, of which they knew little, into human bodies, of which they knew less. The training was wretched, that of Dr Thomas Sydenham, at Oxford, consisting mainly of reading the Greek and Latin texts of Galen and Hippocrates. Dr John Radcliffe succeeded raidy, it is said, by his ready wit, and many paid his high fees to hear him talk. His medical library, he said, consisted of small phials, a skeleton, and a bettal. He came from Oxford to London, and was at long there before he charged two guineas for a consultation, and if sent for to the country twenty Finess. He left one hundred thousand pounds, which Oxford was largely benefited. He was closen principal physician to Princess Anne of benmark; and although he cleared six hundred Finess a year by attendance on King William, he refused to be called the king's physician. Queen Mary in 1691 gave him a fee of one thousand Finess for prolonging the life, for a little, of the of Queen Anne, the Duke of Gloucester, 'who,' ars Mr Gosse, would have been king of England, herhaps, if his mother had not given way to temper and denounced the great doctor.' He attended the Est of Albemarle in Belgium, for which the king aid him twelve hundred pounds. He advised Pope then seventeen to study less and ride more, much to the benefit of his health; he was the means of aring the life of Dr Sharp, Archbishop of York, to trated Swift for dizziness. Princess Anne dismissed him because he said her distemper was Making but the 'vapours;' and he reported rather roughly on the ankles of William III.: 'Why, truly, I would not have your two legs for your three kingdoms;' predicting the king's speedy death at the same time. His alleged refusal to attend Queen Anne, with the censure it brought upon him, is said to have hastened his own death from

apoplexy.

There have been Great-Hearts, great heads, and skilful hands in connection with the medical We have had, amongst others, Sir Thomas Browne of Religio Medici fame; Dr John Brown, author of those delightful Horæ Subsecivæ volumes, with the inimitable Rab, and papers on health; Sir James Young Simpson, of chloroform fame; Jenner, renowned for the discovery of vaccination; Lister, for antiseptics; Finsen, for the light-cure; and Lorenz, for bloodless surgery. Oliver Wendell Holmes will be longer remembered as the author of the Autocrat of the Breakfast-Table than as Professor of Anatomy at Harvard. In appearance he was quite like a medical practitioner, and when in this country at fourscore nothing but his white hair betrayed his age. He had a merry eye, great quickness of apprehension, and was as full of fun and nimble as a schoolboy. Another American writer, J. G. Holland, founder of Scribner's Mayazine, practised medicine for a short time. Professor William Osler, author of Principles and Practice of Medicine, has come from America to Oxford.

Dr Silas Weir Mitchell, of Philadelphia, is prominent both as a poet and novelist. Our own Sir A. Conan Doyle received his best literary 'tip' when an Edinburgh medical student from Sir Joseph Bell, which he developed in the strikingly successful series of stories regarding Sherlock Holmes. Medicine knows him no more; he has even diverged into politics. Sir Benjamin W. Richardson, one of the most prolific writers of the age, was an early champion of cycling and of total abstinence. Physician to the Newspaper Press Fund and the Royal Literary Fund, he was notable as a sanitary reformer, and his lecture Hygeia, a modern city of health, was a forecast of the Garden City. Sir William Priestley learned much from his former master Sir J. Y. Simpson, and was the first to convert midwifery into obstetric medicine by using scientific methods to elucidate its problem. Sir Andrew Clark used to impress on his patients that 'Nature is inexorable; you cannot evade her. Sooner or later she will repay.'

Sir Frederick Treves, one of the King's surgeons, has said that all the great advances in medicine and surgery have been made by men who have worked for positively nothing, and have made a present of their discoveries to the world. Sir Frederick told an interviewer that performing big operations every morning made existence rather trying. Besides the operation on the King, he has performed upwards of one thousand operations for appendicitis quite successfully. He got tired of his duties—they bored

him to death; so after twenty-six years of practice he retired. He said, 'Not that my labours were breaking me down. Nothing would, I think, do that. I have no nervous system, not having had need of one, and I have never had to keep to my bed.' Describing his day's work, Sir Frederick says: 'I was invariably down at five o'clock. I breakfasted at seven, and almost without exception there was an operation at nine. Then, right up to one o'clock there were patients to see. After that I went out, and, having lunched in my carriage, devoted the afternoon to consultations. When did I get home? At all hours. This, as I have said, was a sort of existence of which anybody was liable to grow tired.' Since the critical operation on the King, which brought him fame and success, he has taken a trip round the world, and written an entertaining book upon the subject, entitled The Other Side of the Lantern. He quotes a Japanese gentleman's views as to our origin, whose conclusion is that 'we all come from ancestors.' More important is Sir Frederick's tribute to the Japanese army medical staff, which was at war with bacteria long before the nation was at war with Russia.

Nothing is more striking in the history of modern missionary enterprise than the great and immediate success of medical missions. The witch-doctor may cheat the negro or Kaffir of all he possesses, and give him useless charms, bones, or lizard-skins in return; the medical missionary gets the heart of the native by kindness, sympathy, and the cure of bodily ailments. The late Mrs Bishop (Isabella L. Bird), the great lady-traveller, was never weary of bearing witness to this valuable side of mission work.

Sir Francis Laking, another of the King's doctors, whose recommendation of currants has been greedily used by the bakers as an advertisement, is a cheerful optimist, and once, in conversation with a Londoner who complained of hard work and of having little time to play, and the great care necessary in all our habits, the doctor said, 'We do too much of that. Some tell a man to take this for his meal and others to take that, and the man himself wants a steak. Nine times out of ten instinct is right. But instinct means moderation; so, above everything, be moderate. Nature calls for the conservation of energy for use in later years, so conserve your energy. The young man in the City works hard for fifty weeks in the year, and then spends the other two in climbing high mountains in Switzerland. He is wrong; it would be better if he had stayed in bed and conserved his energy.' This is in line with the teaching of Dr George Keith in A Plea for a Simpler Life and Fads of an Old Physician; but how many of us think we can afford the time to follow the rules there laid down?

Our King believes in sunshine and fresh air, and in the proverb, 'Where the sun does not enter the doctor will,' moderation in food and drink, with eight hours' sleep, and prefers cheerful, optimistic doctors around him. He has shown great recupera-

4 14

tive power in serious illnesses, and has been more inclined to accept advice than Thackeray, who said once, in reply to the question if he took medical advice, 'What is the use of advice if you don't follow it? They tell me not to drink, and I do drink. They tell me not to smoke, and I do smoke. They tell me not to eat, and I do eat. In short, I do everything that I am desired not to do; and therefore what am I to expect?' He could hardly expect longevity, and did die much under the threescore and ten. So did Dr E. C. Robson Roose, who wrote upon longevity; he died at fifty-seven.

One out of the thirty-seven thousand medical men in the United Kingdom, who preserves his anonymity, has written a very honest, straightforward, and helpful narrative, entitled Confessions of an English Doctor (Routledge & Sons). The book fairly takes one behind the scenes; the writer is as honest in stating the truth about his fellow-practitioners as he is in dealing with his patients. He tells us plainly that a doctor's life is one of the hardest of the professions; from 9 A.M. to 9 P.M. is sometimes the working day, with a chance of being called up during the night. A doctor's life, he tells us, is anything but a desirable one; only a few become rich, and many have to keep up an appearance which 'drains their profits to the dregs.' This English doctor has himself been successful, and began at the lowest rung of the ladder; but he honestly advises those who have the slightest thought or inclination for any other profession to leave medicine alone. Our present writer started in lodgings, for which he paid fifteen shillings a week, with permission to affix his name-plate on the garden-gate. Then he took an empty house next door on faith, and furnished a small consulting-room, two bedrooms, and a dining-room tastefully but cheaply. The sole occupants were a servant and himself. He worked hard inside the house and out, as mechanic, gardener, upholsterer, extra servant, sometimes charwoman, as well as professional man. He never at first employed any one about the house if he could possibly do the work himself. Before moving into his new house, pulling down the blinds in case he should be lowered for ever in the eyes of possible patients, he put down all the carpets and hung the curtains, and did other odd jobs. Once, when his servant had to be dismissed for drink, he turned up his sleeves, and with bucket, soap, and brushes cleaned the kitchen. He says: 'I can feel the very grit of whiting and hearthstone still on my hands as I now write twenty years afterwards. I remember nearly every brick on that uneven floor. I felt happier when I had conquered the kitchen.' By 11 A.M. he was washed and brushed up, and on his way to his patients. In this same house he slept eight nights alone, and managed to keep up appearances. If it had been known that he was as poor as a church mouse his career would have been

The section on the training of medical students is

well worth consideration by parents and guardians. The autobiographer tells a good deal about his own experiences at Edinburgh University, and gives pen-portraits of all kinds of students, the clever, plodding, hard-working, as well as the idle and dissipated. Of greater importance than the choice of a medical school is the social and domestic life and surroundings of the student. How can there be, he asks, any satisfactory examination results if the student takes to 'wasting' or perhaps drinking and gambling? Thousands going into lodgings enter a domestic life that conduces to irregular habits. This is how he puts it: 'The number of youths who commence to study medicine and who rapidly go to the bad is appalling, and this is chiefly due to the fact that they are suddenly cast into vortices of mixed pleasures, having no restraints and no inducements to walk in straightforward paths beyond what their own sense, or want of it, instructs them.' Some of his ollege chums who entered on these paths would now be glad to clean his boots for a drink or a cigar. Besides the inability to pass examinations by loose living, character and health are thus often tainted for life. The author of the book had no inclination towards being a model student, who seemed to him an unattractive, narrow-minded person. He studied life as well as books, and at ast liked Edinburgh society infinitely more than study; but he took alarm in time, applied himself to his books, worked hard, and got his degree. In his opinion the brain of a boy needs a good deal of knowing; supposed fools have developed into splendid men, and clever book-boys have passed

This experienced physician's hints on success show great worldly wisdom and common-sense. Nothing, in his estimation, creates success more apidly than style. Then the public do not like a doctor to be too boyish-looking; he must never display his own ignorance or be seen drinking at Public bars or playing at doubtful games. He must te faultlessly dressed, and a good wife may be a Taluable asset in the way of reliability. Married, be is more of a fixture, more in earnest, and thinks nore seriously of the future. 'Marry, therefore, if on are a young doctor and wish to succeed in practice; but, I pray you, be careful to whom you lasten yourself for life.' Not too soon, however, as to early marriages are seldom happy. The young doctor to be successful must possess steadfastness, directness of purpose, and keen interest in his work. A little 'side' is sometimes useful, and one regrets notice it emphasised that neither business nor Professional men can be strictly and constantly bonest nowadays.' The writer believes in going to durch; attending church is a mark of orderliness and respectability. He keeps himself abreast of the tes medical literature, too. Accurate and final bowledge, he justly says, is the bed-rock of safety

Ductors are the repositories of secrets sad or

glad, and sometimes comic. Sir John R. Robinson has related the story of a beautiful vase in the home of a doctor. It was given to him by a grateful young lady who came one day and said she had a secret. She was about to be married, and married to the only man she loved; but unfortunately, when a foolish girl, she had flirted with a young cousin, and had tattooed his name, 'Johnny,' on the calf of her leg. The doctor asked if the bridegroom's name was Tommy, as, if so, there would be less trouble in making an alteration. His name wes quite different, so the tattoo-marks were redone with milk, although an ugly scar remained. Dr Cæsar Hawkins, when in company with Robert Lee, who had kicked a bit of orange-peel from the pavement to the roadway, replaced it, with the words, 'What are you thinking about?' Was this a joke, or was he in earnest?

The section regarding the writer's fees is inter-We go beyond his record, however, and give a few gleanings from lives of various medical men as to sums earned. It does seem hard that doctors who are saving the lives of patients every day should be the last men to have their bills paid. We are told that doctors in the East End of London will visit and provide medicine for a shilling; others give advice and medicine at a dispensary for sixpence. Contract work is even worse paid. It seems that tens of thousands of families in Great Britain, by the contract system which prevails in working-class or manufacturing districts, receive medical attendance and advice for threepence a week. Medicine and dressings are even provided. A gray-haired, worn-looking practitioner, clever, and only thirty-five, once told the writer that he could retire had all debts been paid by former and present patients. Every doctor has to think a great deal about his fees, his expenses are so great. Very rarely does a medical man become rich. Mr Lawson Tait sets down the average income of medical men in England at two hundred pounds a year. None of the research work done in hospital is paid for, and very little of the hard work. Doctors appear to be debarred by etiquette from suing patients for their bills.

There are some plums going, however. Thomas Dimsdale (1712-1800) was invited to St Petersburg by the Empress Catharine to inoculate herself and the Grand Duke Paul. The visit was successful, and he received as fee ten thousand pounds down, with an annuity of five hundred pounds, and two thousand pounds for expenses. Professor Charcot, a French specialist on nervous diseases, had two thousand pounds from Dom Pedro of Brazil for a single consultation. Dr Playfair received two thousand four hundred pounds for attendance upon the Crown Princess of Roumania on the birth of Prince Charles. The Czar is said to have paid ten thousand pounds to the chief doctor who was present at the birth of a Czarevitch. Sir James Paget thought 24 Henrietta Street, Cavendish Square, London, a lucky house, and there his success was gradual but

constant. Beginning at seven hundred pounds, his income gradually rose until it exceeded ten thousand pounds a year. When he gave up operating it fell to seven thousand pounds. For some years he had the most lucrative practice in London. The year in which he attended upon the Princess of Wales his practice was doubled, which shows how people like a fashionable doctor. There was a distinct increase of practice after attendance upon much-talked-of cases. Sir James has recorded that mere notoriety with some people is a sign of merit, and that reputation is measured only, or chiefly, by money, and may be obtained by self-assertion, selfadvertisement, or mere impudence. During the first seven years after obtaining his diploma, his largest income from practice was twenty-three pounds thirteen shillings, and till he had been a surgeon for sixteen years it never exceeded one hundred pounds a year.

Sir Benjamin Brodie's professional income, which was one thousand five hundred and thirty pounds in 1816, had risen in 1823 to six thousand five hundred pounds. This went on from year to year till it rose to eleven thousand pounds. Dr Charles J. B. Williams, who was one of the Physicians Extraordinary to the Queen, had in 1842 fees from private practice amounting to six hundred and eighty-one pounds; six years later they had increased to three thousand six hundred pounds. was his opinion that the fee of a guinea was not sufficient for the amount of time and skill bestowed upon a new case, and that the first fee ought to be at least two guineas. Compared with those of consulting barristers of the highest eminence, the fees of a doctor he considered low. It would be easy to give a contrary opinion. A tribe of Indians on the Columbia River had a simple method of paying their medicine-man if he did not cure his patients. Smallpox broke out among the Wishrams. Their medicine-man devoted himself to the sick, but did not cure the smallpox, and many died. Tying the hands and feet of the doctor, they put a rope round his neck, and attaching the other end to the pommel of a saddle, they started one of their horses, and he was thus hanged. This, of course, was a method of barbarism.

Ian Maclaren pictures Dr M'Lure, the village doctor, that tall, gaunt, loosely made man, with the clever hand and the kindly voice, in the humble room of the shepherd's cottage, taking pretty much what the people chose to give. If a doctor cannot become rich, he can be a wonderful comfort and Aside from medical benefactor to humanity. service, the doctor is a great benefactor both in town and country if he possesses a cheerful disposition, and none but healthy, cheerful men should ever be doctors. Lord Kelvin has declared that when a doctor keeps up a patient's spirits he is administering spiritual consolation, and that many a poor fellow laid up with a broken leg in splints looks for the moment in the weary twenty-four hours when the doctor will give him a kindly word,

although only in passing. Doctors have thus much in their power by way of helping and sympathising with their suffering fellow-beings. And in spite of our advancing civilisation we cannot do without them; nay, civilisation has given them not a few complicated problems in disease to conquer, if

Long ago, in his delightful Horæ Subsectivæ, Dr they may. John Brown inculcated the necessity of having a cheerful and intelligent physician. Now Dr Alfred T. Schofield, in his Unconscious Therapeutics, of which a second edition is published by Churchill, wishes it made a science. No medical training, he tells us, can be complete that does not teach it. Psychotherapeutics is likely, therefore, to be added to the curriculum of the young medical. Dr Schofield gives abundant reason why this should be so, although the thing is largely a matter of training and temperament. The psychic wave, mainly of American origin, besides disgusting most thoughtful minds with its extravagances, and carrying away thoughtless minds with its pretensions, contains sundry deep underlying and notable truths.' Dr Schofield in his book has caught and enforced these truths and avoided the nonsense in the movement, and shows the power exerted by the personality of the physician, a subject the study of which is still ignored.

THE MAN WITH HIS BACK TO THE WALL.

A LITTLE bit gray and quiet—that's all;
With an anxious look to appear his best
And smile as the blows of misfortune fall,
And toss them aside with a seeming jest.

Just a trifle slow where he once was quick,

And the lines that come from fond hopes deferred
On his upturned brow—they are graven thick—
Such a mute appeal for your kindly word!

But no cringing glance in his dauntless eye; Just a tightened strain on the upper lip As he straightens his arm for another try, And clenches his hand for another grip!

They have passed him by; and his clothes are worn,
For the pence are scarce and the times are bad—
So he fights alone, to avoid the scorn
Of those friends that he thought he once had had!

There are hundreds such in this cruel town!

Men are thrust aside as, at forty, old;

For youth will be served, so we tread these down

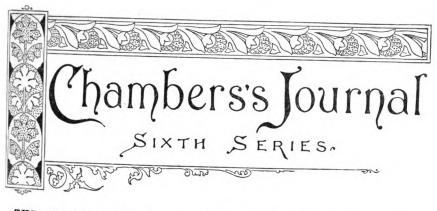

In the scrambling race of the lust for gold!

New methods are born—to be up to date—
Yes, the older man is the one that goes.
Then call him in, and announce his fate;
—And his future?—ah, that God only knows!

On self so intent, as you pass along,

Have you ne'er a word, ne'er a thought at all—
'Mid the rapid rush of the world's gay throng—
For one who fights with his back to the wall!

J. S. REDMAINE, M.A.

THE KREEKARS OR ADVENTURERS OF 1523-24.

By Viscount DILLON.

N 1523, when Charles Brandon, Duke of Suffolk, was invading France, we read for the first time of a body of men nearly one thousand in number, 'proper men and hardy, having little

wages or none, which lived alonely on their adventure, wherefore of some they were called Adventurers, of some they were called Krekars.' They are further described as 'light, lardy, and politic, by their manhood and hardiness had robbed many towns, taken many prisoners, with great booty, and daily brought to the army lorse, mares, victual, cloth, corn, &c., and other necessaries which might not be missed. Of this company, the Frenchmen, and especially they of illages and passengers, were sore afraid, for they were never idle, but doing something in one part or other.' They were commanded by Sir John Wallop.

After the capture of the town of Montdidier on the 28th October, the English troops, with some Bargundian allies, began a series of long and tedious marches in bad weather, always looking for the arrival of the Duke of Bourbon with ten thousand Germans, who were to have joined the English Bourbon, however, turned of in another direction, and laid siege to Marcelles. Suffolk then continued his march by Veane, Beanford, and Mont St Martyne, whence he sent home Lord Sandes to tell the king of this want of hith on the part of Bourbon. Still going forward, the English force found the weather worse than free, the men suffering from frostbite and other hardships. At last the Welshmen in the army set To a shout of 'Home, home!' on which the Archars cried, 'Hang, hang!' and the troops ray nearly came to blows among themselves. Suffolk then attacked and took the castle of Boghan r Rowhen. Meanwhile Lord Sandes saw Henry, vho said, 'All this we knew before your coming,' and he added that six thousand men had been got redy under Lord Mountjoy to go to the help of Brandon's force, which was not to break up.

Before this new force could get out, Brandon had moved to Valenciennes, a town of the Emperor of Germany, where he laid up his ordnance, and then marched to Tournay en route for home. Eventually they came back to England, some by Antwerp, some by Calais, but much to Henry's displeasure.

We next hear of the Kreekars in April 1524, when Captain Breerton, one of their officers at Guines, went to a village called Waste and took a large booty; but an alarm being raised, two hundred French horse from Boulogne surprised the English. Breerton called out to the French captain that the whole affair was due to him; that he was a gentleman, and his men should be allowed to surrender. This they did, giving up their arms. However, from one hundred and twenty to one hundred and forty of the country-folks came up and desired to buy the prisoners, which the French troops agreed to, and, getting the money, rode away. The countrymen then cut to pieces the disarmed Englishmen. When Sir John Gage, the captain of Guines, heard of this he called to the Adventurers to revenge the death of their comrades. Accordingly, forty archers and pikes set out on the 14th, and burnt Waste, hanging thirty-six of the thirty-seven prisoners they took. On their way back they met the French troops, who, however, did not interfere with them. The English then sent their one prisoner to the captain of Boulogne with a message that henceforth they would spare neither man, woman, nor child.

In May, Sir Robert Jerningham, captain, of Newnham Bridge, planned an attack on Boulogne with some seven hundred men, including one hundred and sixty Kreekars. Captain Coo, with three ships, was to co-operate by sea; and the land force arrived early, near to Boulogne, but were seen by the French scouts. However, the Kreekars fought their way into the lower town, while Sir William Fitz-William collected many cattle, horses, and other pillage. The alarm being now general, Captain Coo got his men back to their ships; and Reserved.]

MARCH 16, 1907.

[All Rights Reserved.]

the land force, having burnt granges and villages, returned in safety to Calais.

On the 31st May, Fitz-William arranged for another raid, and this time the Kreekars found themselves between two large forces of the French; but some English horse saved them, killing forty-four and taking fifty-six French.

In June, Fitz-William, Wallop, and Gage raided into Picardy and attacked the castle of Hardingham. Here the Kreekars again distinguished themselves; but the commanders, hearing of the approach of some four thousand French, felt that nine hundred English, weary with the assault, would have but small chance, so the force returned to the Pale.

In August the French assumed the offensive, and a large force penetrated far into the Pale, but after a series of skirmishes and ambushes, with varying results, withdrew to Boulogne; promising, however, to visit Calais oftener in future.

Again, on the 12th August, Jerningham advanced to Marquison with three hundred and sixty men and the Kreekars, and also carrying five boats in order to pursue the French across the creek. The Kreekars crossed over and slew sixty of the French, who vainly tried to prevent their landing. More French came up, and the battle was renewed, till, being beaten back, they took refuge in the church of Margyson. The English set fire to it, and of the three hundred French who rushed out of the building only sixty saved their lives. Troops arrived from Boulogne; but, finding they were too late, they did nothing, and Jerningham returned with a good booty to Calais.

The French now thought they would try their luck with the Flemings, and a force marched toward St Omer. The captain of Turnahan sent word to Fitz-William at Guines that the French were afield, so the English captain said he would go and meet them; but, learning that another French body was going to attack Guines, he took up a position to receive the French. However, the

French changed their plan, much to the disgust of Fitz-William, who returned to his charge.

In September three French horsemen who knew their way about actually penetrated into Calais, carrying off a man and his wife, and twenty pounds in money. Nothing was known of this in Calais until the demand came from Boulogne for the ransom.

At the end of September, Jerningham and Sir Robert Palmer each having made successful raids into the French territory, the Kreekars began to think it time, now the winter was coming on, to undertake a profitable expedition. Accordingly, with twenty-five light horse for scouting, and with a banner of St George, the Kreekars went toward Mustrell, where they got a good booty of cattle, &c., and were on their way home when they were descried by the Earl of Dammartin and a French force, who were on their way to attack St Omer. The English horse, on perceiving the large French force, fled, and left the foot to defend themselves. These looked for a good position, but failed to find one. Then the captain said, 'Good fellows and brethren, we have of long time been called Adventurers; now is the time come of our adventure. The Frenchmen will not ransom us for nothing, we be amongst them so feared. If anything save our lives it must be God and our hardiness; and therefore, said he, 'if you see me begin to fly, slay me out of hand.' Then every man cried God mercy and kneeled down, kissed the earth, and strake hands each with other in token not to depart, and then made themselves ready for the defence. While their arrows lasted they were able to keep off the French, but when these were exhausted some of the French dismounted and used pikes and crossbows. Many of the French were slain, but at last the horsemen broke the Kreekars and killed them all. 'This was the end of these companions called the Kreekars or Adventurers, which were as hardy men as ever served prince or captain.'

THE LORD OF THE MANOR.

CHAPTER XVII.

HE peace of the Indian summer seemed to lie over all the land. They were halcyon days for the Castleraynes, such as they had no recollection of before; and the weather seemed to be in sympathetic mood.

There were the still mornings filled to the zenith with the pearly mist out of which the rowans and the ivy-clad walls of the encircling castle rose, then the gradual transformation to the thin pink veil, with the Common rising like a picture beyond. No sound broke the stillness; nothing disturbed the sheets of bracken beaten now to a dull-red gold, a flaming scarlet, a pure veined cream where the

shade of the oaks had protected it. Nature rested in a kind of orange glory. The fine profligacy of the October hedgesides struck the eye boldly; the bees, drugged by the saffron, had ceased to hum in the still air; even the sea was silent.

The gales would come later; the rain would roar over the hillside in blinding battalions; but that time seemed far off. Inside the house was the same feeling of peace and restfulness, the same brimming joy of existence; for the skeleton had gone, and the cloud of debt had vanished. There was nothing to be afraid of now, and Miss Castlerayne positively grew fat over the red-lettered tradesmen's books which she was now paying

regularly each week. She had forgotten all about her harbour of refuge at the hospital. She had a rague idea that she would go back there some of these days. But not yet, not until Rayne Castlemore was fit to take the reins of government once more in his own hands. He was wonderfully better; he had made marvellous progress since the day when Mr Summers had come with the good news. He had asked no questions; he was quite prepared to take the goods the gods provided. He was getting about his bedroom now, and was eager for the sunshine.

'I've told him to come down to dinner to-day,' Marfell said. He was a little more gracious than usual, his white hair almost on the verge of tidiness. The paying of his account had perhaps had a mothing effect. 'After to-morrow he may do as he likes."

'A most wonderful recovery,' Miss Castlerayne said unsteadily, 'is it not?'

'Nothing of the kind,' Marfell retorted. There was the opportunity to contradict that he had longed for without violating his conscience. 'Really, there was nothing the matter. I told you from the first that there was no real brain-mischief. There are some natures that can't rise superior to trouble, and your brother is one of them. You say that are never worried him. That was because he only thew care by hearsay; he could not believe that it would come. And when it did come, when it was brought home to him, the shock was very great. The trouble vanishes, and he begins to be himself again. He will be quite well by the end of the

Marfell's prophecy was fulfilled to the letter. By the end of the week Rayne Castlerayne was quite himself again. He began to hold up his head coce more; there were one or two little schemes for the improvement of The Towers that might be put in hand. The balance of his windfall he regarded & quite inexhaustible.

'No, no,' May protested; 'let us wait a little and to if the good fortune is going any further. Even as it is, we cannot afford to live here.

Mr Castlerayne demurred. They were walking egether along the terrace on the west side of the house, in the sun. There were still a few late roses, but for the most part the trees glistened with the clasic shine of cobwebs. Angela paced up and down with the others gloomily. She was the only one of the family who looked none the better for the good fortune. She was pale and distracted; there were dark rings under her eyes. She had homents when May found her very difficult.

What do you want me to do?' Castlerayne uked

'Invest the balance of your windfall,' May aid Ask Mr Warrener to advise you. He will te able to do that to the best advantage. It oght to give us another three hundred a year, which, with the rent of The Towers, will enable

'Leave The Towers?' Mr Castlerayne protested. 'Really, my dear child'

'Leave The Towers,' May went on inexorably. 'We had arranged to do it before. We have nothing like enough money to live properly here. Oh! don't let us drift into debt again. Let us be thankful for the unknown benefactor'-

'Is he unknown?' Angela asked suddenly. There was a look of scorn on her pale face. 'May, do you mean to say that you don't know who purchased that land-you don't know whose charity we have been relying on ?

A puzzled expression crossed May's face. It was clear she did not understand.

'Indeed I don't, my dear,' she said. didn't ask any questions. Mr Summers told me that the purchaser desired that his name should not be mentioned for the present. He had consented not to start any trade there, and that sufficed me.

'Then the offer has nothing to do with the great secret you and Mr Warrener

'Nothing whatever,' May cried. 'If you had been sharp-sighted enough to discover'-

'It is rather you who have been so blind,' Angela said bitterly. 'But I thought you knew. The purchaser of that land is your friend Clifford Warrener.

May's look of astonishment was perfectly genuine. Angela could see that at a glance. Mr Castlerayne was taking no interest in the discussion whatever. He was rather afraid that some of the roses needed renewing.

'Are you quite sure of your facts?' May asked. 'I hardly think that Mr Warrener'-

'Would have kept you in the dark,' Angela cut in in the same bitter strain. 'Evidently he has done so on this occasion. But he is the purchaser of that land on the far side of the hospital, because he admitted as much to me.'

'Go on,' May murmured. 'You don't know how interested I am.'

'There is very little more to tell. It happened the morning after father was taken ill. I sat with him most of the night, you remember.'

'Good girl!' Castlerayne said sotto voce. He was examining the heart of a tea-rose with consuming interest. 'The comfort that one gets from one's children, especially if they have been brought up as well as means'-

'It is a blessed privilege.' Angela laughed unsteadily. 'I went for a walk before breakfast-I could not sleep-and I met Mr Warrener. It was quite early; he was out with Mr Brooke practising golf-strokes. It struck me then as rather a strange thing for two grown men to be so childishly occupied.'

'Not at all,' May said in some indignation. 'Golf is a great institution. I have heard it called one of God's good things. Look what a healthy game it is, so devoid of morbid excitement. I have been having lessons from Mr Brooke. He is one

of the finest players in the country; he is a great authority on the game, and he tells me that we have the making here of perhaps the best golf-links in the kingdom. The turf is absolutely perfect; the greens are wonderfully good; the hazards are just what they should be, and they are just in the right places. The Romans probably

played golf here.'

'Go on,' Angela laughed. 'Apparently you have caught the fever. Tell us that golf is a panacea for old age; in fact, there is no old age when one takes to golf. I believe that in Scotland it is an institution. But you interrupted me. As I was saying, on that particular morning I met Mr Warrener. I told him everything. He stopped his game at once, saying that he had to go to Hardborough. Of course I did not guess what was in his mind then, but I knew directly Mr Summers came. As soon as Mr Summers told us all about the mysterious sale of that land I knew quite as well as if Mr Warrener had made a confession to me. And you didn't, May?'

'I give you my word of honour that I didn't,'

May declared.

'I can't think how you could have been so blind. Oh, can't you see that this is only another form of accepting charity? I said nothing about it till dad here was strong again.—There is nothing the matter with that rose-tree; it is only that the bark has grown rusty.—I repeat that we owe all our present prosperity to the charity of Mr Warrener. He didn't come and fling the money at us; he is too much of a gentleman for that. But he does something that is quite as transparent: he buys some acres of mud and sand at a fancy price, and pretends that he has driven a wonderfully good bargain.'

'So he has,' May said calmly. 'I begin to understand now, though I had not been consulted as to the developments. If you taxed him with

'I have done so; and he did not deny it.—

Father, have you nothing to say?'

Mr Castlerayne abandoned his critical examination of the offending rose-tree with reluctance. He had no great admiration for Angela in these moods. He was never likely to conquer his distaste for

facing an awkward question squarely.

'Really, my dear,' he protested, 'I fail to see why you should drag me into the business. I have a certain estate to dispose of; on the other hand there is a man who needs the estate. He offers me what appears to be a fancy price; in reality, it may be a great bargain. I lack the commercial mind, so I can't possibly tell. Warrener is a gentleman; he belongs to a good old family; he is a very nice fellow, but he is essentially a man of business. I refuse to believe that he bought this land to please me. I shall be very glad if you will ask him to come and dine to-morrow, and bring his friend Brooke along. I was at Oxford with a

Raymond Brooke. I wonder if this man is any relation.'

Probably Angela would have persisted in her hopeless task had not she detected the mocking smile in May's eyes. That smile seemed to take all the steel out of her arguments. For, till quite recently, May had been more vehement on the subject of the family carelessness than herself. May had always soundly denounced the extravagance and sin of debt; she was the last person in the world to nibble at the bread of charity, buttered though it might be and spread with caviare withal. And May, though Angela had obviously surprised her, was not in the least annoyed or offended; quite the contrary.

'It is no use for you to "kick against the pricks," the younger girl said. 'I am perfectly certain that Mr Warrener has made an excellent bargain. He could sell that land for twice the money to-morrow. My dear, you are like Mrs Partington with her broom trying to sweep back the Atlantic Ocean; you are a pretty little fly on the wheel of progress. Would you like to know everything?'

'Of course I should,' Angela admitted. She laughed despite herself. 'Being a woman, it is only natural I should have a little curiosity.'

'Then your curiosity shall be gratified. You shall make your peace with Clifford Warrener in your own way afterwards. Go into the house and write the note dad requires to those two men asking them to dinner to-morrow. Cophetua, Cophetua, you are translated! "For you shall walk in silk attire, and siller hae to spare!" And to-morrow night you shall know the great secret.'

CHAPTER XVIII.

T was with some hesitation that Angela fulfilled her father's request. She had not seen Clifford Warrener for some days; it seemed

to her that he was keeping out of the way. She wanted him, and she did not want him; she did not recognise as yet how essential he was to her happiness. It had pleased her lately to look upon Warrener as a purse-proud man who had tried to earn favour at the hands of the Castleraynes by a clumsy expedient which was obviously borrowed from the cheaply sensational class of novel.

And yet Angela was doubtful. She felt more than doubtful after she had exploded her mine with so little effect. She had expected, at any rate, to enlist May on her side. But May seemed to be in close alliance with the foe; also, she had shaken Angela's most cherished convictions by her statement that Warrener's action had had nothing of charity about it, but that the most possible explanation was a mutual convenience.

If that were so, then Angela would have to apologise. In the plainest possible words she had

accused Warrener of thrusting his charity upon the family; indeed, she had gone further than that She knew that Warrener loved her; she dared not ask herself yet if she reciprocated that feeling. She knew that she dared not analyse her feelings, and she had actually told Clifford Warrener that he had done this thing as a cheap and short cut to a girl's heart. The words came back to her now with cruel force. Warrener had turned his back on her and gone away without another word. Really, he might have stopped; he might have given her a chance to prevaricate, as women can in such cases. But he had gone off, obviously wounded, and the girl had not seen him since. If May's contentions were correct, then there would be nothing for it but a penitent apology. Angela recognised that, and she would make the apology whatever it cost her. So she wrote the note, and in the course of the next morning came the reply to the effect that the men in question would be only too happy. Angela had settled the dinner Beau with Aunt Gertrude; she had nothing to do. May stood before her, radiant in homespun skirt and coat, with a bag of new clubs under her

'Come along and try this exasperating, fascinating game,' she cried. 'My new clubs have come; Mr Brooke got them from Westward Ho for me. He says there are no clubs like Gibson's. He is going to give me a lesson. Do come and set'

Angela hesitated for a moment. She had very little doubt that Warrener would be there also. She felt that she would like to meet him before he came to dinner. Angela told herself that the did not quite approve of the way in which lay was passing her afternoons in the company of Mr Brooke. There was a sacred duty before her.

On the level plantation of ground before the half-ruined Dower-House the powerful figure of Mr Raymond Brooke stood. He was contemplating the sweep of landscape before him with admiring trangering rattle of mowing-machines. Certain saches of the turf looked a lighter colour than the rest. Here and there red and white flags fluttered from tall bamboo sticks; here and there were poles picked out in red and white and blue. May's with pleasure.

Oh Angela! they've laid it out,' she cried. They must have worked like demons since the rarly morning. And H—, the champion, only haurally good it is, to get everything ready so

Brooke came forward with his cap in his hand. He took the bags and handed the clubs to a couple of small boys standing by. Angela had lad a great deal to occupy her attention lately, a guilty feeling came over her as she saw

the familiar terms the golfers were on. It was a relief to know that Raymond Brooke was in all ways desirable.

'It's all ready,' Brooke cried. 'The course is as good now as it ever will be. To my mind, there is nothing like it in the kingdom; an absolutely natural course—the golfer's ideal dream! And here it has been all these years, and nobody has discovered it.—Miss Castlerayne, are you going to have a lesson too?'

'I am not,' Angela said decidedly. It was obviously the answer that was expected of her, and Brooke looked relieved. Golfers are generally selfish people, and hunt in couples. Occasionally they make a favour of taking in a third player; but the politeness is of the shallowest kind. 'I am going to keep at a respectful distance, and watch you.'

Brooke smote a ball long and far in the direction of the first flag, and May followed. Angela heard something that sounded like a 'perfect series of brassy lies;' but the jargon of the game was quite beyond her. If she had only realised what an abject slave she was going to become before long!

'It is glorious!' May cried. 'You must have a try, Angela. To think that we have conquered boredom for good and all! Castlerayne will never be dull to me again.'

It sounded foolish and extravagant; but there are thousands of wise and good people—statesmen, divines, authors, poets, and the like—who say the same thing; and there are thousands of poor villagers away up north, on sterile coasts, who have good reason to welcome the advent of the finest outdoor game that ever came as a boon to mankind. But Angela was not enthusiastic yet. She was almost glad when Warrener appeared. He came out of the Dower-House with a man who in some subtle way conveyed to Angela that he was an architect.

'No, I'm not going to play,' Warrener said. 'I have too much to do.—Miss Angela! You have my sincere sympathy in your sister's affliction. She's got the fever.'

Angela laughed; her face flushed slightly. She wondered why she always felt so exalted and happy in the society of this man, and why she always quarrelled with him. She was a masterful girl, and she had met her master. When she realised the fact she had her happiness fairly grasped in both hands. He seemed to have forgotten their last disagreement; there was a smile on his face, and something in the look of his eye that caused Angela to cast hers down. So he had not forgotten her, and she was insanely glad.

'Let us follow them,' he suggested. 'I want to go over the whole course now that it is finished. Between ourselves, I am almost as enthusiastic a player as Brooke, only he has more time. You see, he had his future ready made. At one time he wanted to be Lord Chancellor; but on mature consideration it came to him that Amateur Golf Champion would be a far more distinguished position. I may say it is much more likely to be realised.'

'He seems a nice man,' Angela said. 'He has such a pleasing, open face."

'He is one of the best fellows in the world,' Warrener cried. 'And if my eyes are correct in their reading of those human documents yonder, your sister is a lucky girl. I'm glad of it, because I have a genuine affection for May. She has a very

sweet temper, too.' 'Meaning that I have not?' Angela laughed unsteadily. 'Perhaps you are right.'

Well, you have given me plenty of chances for judging, Warrener said. 'Still, we will not return to that. It is so glorious and perfect a day, with the grass in such good condition, that'-

'Now you are laughing at me!' Angela said with some indignation. 'Mr Warrener, I have to make a sincere and humble apology to you. The last time we were together I was very rude and very unjust to you. How unjust I was I did not realise until this morning. I accused you of laying the family under a great obligation, of taking advantage of your money to impose—to impose—oh, how can I say it? You know what I mean.

Warrener looked down into the beautiful flushed face and tear-laden eyes. Here was the Angela that he had dreamt of, the loving woman who put everything aside for the man and his happiness. All the coldness and haughtiness had gone from her lips.

'I know exactly what you mean,' he said. 'You accused me of trying to win your love that way. It was untrue and unkind, and you knew it all the time.'

'Indeed, indeed I didn't. How could I? You purchased that worthless land at an enormous price, and thus rid us of all our troubles; you saved my father's life. And yet I was angry with you, because I thought more of my wretched self than the others. It is only now that I begin to realise how selfish and cowardly I have been.'

'That's true,' Warrener admitted a little unexpectedly. 'But let me assure you that I have not done anything of the kind. The convenience was absolutely a mutual one. Your father had something to sell; there was something that I wanted to buy. I admit that it was lucky that the purchaser was here just at the psychological moment. And yet, before the misfortune came, if I had told your father what I wanted he would have refused me it. There has been a conspiracy, a conspiracy of three people against the dignity and comfort of the Castleraynes: I allude to your aunt Gertrude, to Craggs, and myself. I am not quite sure that I ought not to include your sister in the plot. At any rate, when I discussed my scheme to her she was very enthusiastic. But we had to use diplomacy. We had to face the latter in the shape

of Mr Castlerayne; we had to make him a rich

'But nobody would call my father a rich man,

'Not yet, but they will in two years' time. The Mr Warrener.' whole thing is going to be divulged at dinner tonight. I was very glad to get your note. And you mean to say that you can't guess what the secret is; that you can't see the gold scattered all over the ground that you are walking on at this very minute?'

Angela shook her head and smiled. She took a tendril of gorse in her slender pink fingers and

'Only this yellow gold,' she said; 'but you can't tossed it in the air.

pay bills with it.' Oh yes, you can. It is all part of the fortune. The gorse is typical of the place, like the heather and the bracken. Angela, if you are satisfied that

Angela murmured a word under her breath. It what I say 'sounded very like 'Bother!' For May and her companion had just appeared from the sloping side of a ravine filled with sand and bracken. Beyond the ravine and a little in front of it was a flat tableland edged with rugged sandhills, and in the centre of the level spot one of the flags waved in the breeze.

'There's no question about it,' Brooke said in the tones of authority. 'These are the best four successive holes in England. Three, two, and one shot holes. To think of this paradise lying neglected here for all these years! I dare say you have been telling Miss Castlerayne all about it.'

'Indeed I haven't,' Warrener said dryly. 'We have been discussing a personal question. I really think that we have come to a proper understanding on a subject that has been a vexed question between us for some time.'

Angela's face flamed, but there was a look of softness and happiness in her eyes. May smiled demurely. Everything was going just as she had

Then you are not in possession of the great hoped for. secret, she said. 'My dear Angela, you must be blind! It lies before you so that he who runs may read.'

Miss Angela has not caught the fever yet, Warrener said. 'But I shall proceed to make a full confession of the whole thing to-night after dinner.'

May waved a club over her head with the abandon of utter enthusiasm.

'To the secret!' she said. 'Here's to the secret, and Castlerayne Golf-Links; and long may they flourish! I shall love them for the rest of my

'Royal Castlerayne,' Brooke corrected. 'If ever the prefix was deserved by any links, it is deserved in the case of Royal Castlerayne.'

(To be continued.)

SOME HAPPY IMPROMPTUS.

HE reference in a recent interesting article, 'With Coleridge at Samuel Rogers',' to Theodore Hook's genius for extemporaneous songmaking suggested this stringing together of various happy im-

promptus, some of which, though doubtless familiar to the reader, are so good as to bear repetition. Of such was the line from Virgil, 'Mantua, va misera nimium vicina Cremona!' quoted by Swift on a lady accidentally knocking down a Cremona violin by brushing against it with her mantle; and that other hexameter, 'Nocte part total; redeunt spectacula mane,' with which he sought to console an elderly gentleman who had lost his spectacles, by telling him that if it were to rain all night he would certainly get them back in the morning.

'Nothing,' wrote Dr Johnson, the prince of teadinkers, as Leigh Hunt called him, 'was ever aid with uncommon felicity but by the cooperation of chance.' His own humorous request b Mrs Thrale for a cup of tea, in ridicule of the

style of the old ballads-

And now, I pray thee, Hetty dear, That thou wilt give to me, With cream and sugar soften'd well, Another dish of tea;

But hear, alas! this mournful truth-Nor hear it with a frown-Thon canst not make the tea so fast As I can gulp it down-

suggests a good starting-point.

The wit of the late Sir William Harcourt is proverbial; but the following piece of humour mar have escaped the ears of the majority. Talking one day to Sir William on the subject of mixing, the late Lord Tennyson remarked that the first pipe before breakfast was the most delightful smoke of the day. 'I see, I see!' Sir Tiliam replied seriously; the first sweet pipe of the half-awakened bard.' The reconstruction of the quotation from the poet's own verse to and the occasion, a reconstruction only involving one rowel, was exceedingly happy.

As the celebrated author of Night Thoughts was one day walking in his garden at Welwyn with two ladies, one of whom he afterwards married, agrant came to tell him that a gentleman wished be the him. 'Tell him,' said the Doctor, 'I am to happily engaged to change my situation.' The blies insisted that he should go, as his visitor Reaman of rank, his patron and his friend. As remasion had no effect, one took him by the rest arm, the other by the left, and led him to be garden-gate; when, finding resistance was vain, be bowed, laid his hand upon his heart, and, in the expressive manner for which he was so temarkable, spoke the following lines:

Thus Adam look'd when from the garden driven, And thus disputed orders sent from heaven. Like him, I go; but yet to go am loath; Like him, I go, for angels drove us both. Hard was his fate; but mine still more unkind: His Eve went with him, but mine stays behind.

It is not likely that many have read the autobiography of Bishop Watson of Llandaff (1783-1813), a clever, political, disappointed man, and a Whig. The Prime Minister of that day expected him, shortly after his appointment to his See, to support the Government in a certain measure in the House of Lords. Said the Bishop, 'I do not consider it consistent with the Christian religion to support such a measure;' to which the Minister replied, 'Nor do I think it consistent with the Christian religion that the first thing a newly appointed bishop should do is to forget his Maker.'

The danger of the use of metaphor in argument was well illustrated the other day during a discussion between a Ritualist and a Protestant. 'You will admit,' urged the former, 'that Music is the handmaid of Religion?' 'Yes,' agreed the latter; 'but I wish Religion would give her a

month's notice.'

Dr Hough, quondam Bishop of Worcester, who was as remarkable for the evenness of his temper as for many other good qualities, having on one occasion a goodly company at his house, one of the gentlemen present desired his lordship to show him a curious weather-glass which he had lately purchased, and which had cost some thirty guineas. A servant was accordingly told to bring it, and in handing it to the gentleman he accidentally let it fall and broke it to pieces. The company was a little upset by the accident, particularly he who had asked to see it, and who was making profuse apologies for the mishap. 'Be under no concern, my dear sir,' said the Bishop, smiling. 'I think it is rather a good omen. We have hitherto had a very dry season, and now I hope we shall have some rain, for I protest I do not remember ever to have seen the glass so low in my life.'

The pump-room at Bath has furnished many a brilliant example of this ready turn of wit. About the middle of the seventeenth century, two subscription-books were opened on the same day—the one for prayers at the abbey, the other for gaming at the rooms. The first evening the numbers stood on them as under, and occasioned the following

impromptu:

The Church and Rooms, the other day, Open'd their books for prayer and play; The Priests got twelve, Hoyle sixty-set How great the odds for Hell 'gainst Heav'n!

A certain captain remarkable for his uncommon height being in the rooms one day, the Princess Amelia saw him and was surprised by the singularity. Upon inquiry, she was told his name and

family, and that he had been originally intended for the Church. 'Rather for the *steeple*,' replied the royal humourist with her usual complacency.

Upon his first going to Bath, Mr Quin the actor found himself very extravagantly charged for eatables and drinkables, as well as for lodging and washing. At the end of the first week he took aside Beau Nash, the Master of the Ceremonies, who had recommended Bath as being the cheapest place in England for a man of taste and a bon vivant. Nash, who loved his joke, and knew that Quin loved a pun as well as himself, replied, 'They have acted by you upon truly Christian principles.' 'How so?' queried Quin. 'Why,' resumed Nash, 'you were a stranger, and they took you in.' 'Ay; but,' replied Quin, 'they have fleeced me instead of clothing me.'

A few nights after, Nash was in company with Quin when he was in one of his satirical moods, and was taking off most of those present in the rooms. Nash, expecting to be the next, got up, and was on the point of retiring, when Quin asked him why he was going so soon. 'In order to save you the trouble of taking me off, I think it is best to take myself off,' quietly replied the Master of the Ceremonies. After his death the corporation of Bath placed a full-length picture of Nash in the pump-room between the busts of Newton and Pope;

upon which the Earl of Chesterfield reeled off this severe and witty epigram:

Immortal Newton never spoke

More truth than here you'll find,
Nor Pope himself e'er penned a joke
Severer on mankind.

The picture, plac'd the busts between, Adds to the satire strength; Wisdom and Wit are little seen, But Folly at full length.

But enough! As Hazlitt truly remarks, 'a perpetual succession of jests is wearisome, and tries the patience of the reader,' so we will close these loosely strung witticisms with one from the floor of the House of Commons. At the time of debating the Union Act, Addison, who, though an elegant writer, was too diffident ever to shine as a public speaker, rose, and thus addressed himself to the Speaker: 'Mr Speaker, I conceive'- but could get no further; then, rising again, he said, 'Mr Speaker, I conceive' Still unable to proceed, he sat down again. A third time he rose, but was still unable to say anything more than, 'Mr Speaker, I conceive' when a certain young member possessed of more effrontery and volubility arose and said, 'Mr Speaker, I am very sorry to find that the honourable gentleman over the way has conceived three times and brought forth nothing.'

AN OPEN DOOR.

CHAPTER VII.-THE DECISION.

OU will come to the moonlight picnic to-night?' said Mrs Scott to Sidney. 'Oh, nonsense. I'll take no refusal; the Wests will be terribly hurt if you don't come.'

So he went with her to the picnic, which was being given at an old ruin, and found a sumptuous repast, with ices and champagne. Mrs Travers was there, talking, laughing, jeering.

'And I thought that I had worked some change in her,' said Sidney to himself. 'Vain hope! Nothing will change her now; she has chosen her own line.'

He began to wonder whether he had influenced any one in these short months that he had spent at Satong. Looking round, he saw some of the young men who had unburdened themselves to him, and he felt that he was an influence in their lives, perhaps the only one that reminded them of purity, of self-control, of the need of Divine help and the possibility of obtaining it.

A few young men! He knew that he had only to take up work anywhere in London to be surrounded by such; so why should he stay in Satong if it was just to influence a few young men?

But as he sat a little apart in the shadow, looking at the somewhat weird scene—the moonlight, the white dresses of the ladies, the impassive faces of the Chinese servants, the things spread for a luxurious repast, with the background of ruins bearing witness of past ages—he seemed to be in a strange dream, in which a voice whispered to him, 'There are souls here which call for your help.' A solemn sense of responsibility came over him; and if the decision had been required that night Sidney would have stayed in Satong.

'Do you see that fair young man over there?' said Mrs Scott, coming up to him. 'He has just come to Satong. He is the son of the well-known Sir Harry Denistoun. I wish they would not send such young fellows out here. I believe the idea was that he should stay some years at Hong-kong, and there he would have found plenty of companionship; but the firm's representative up here fell ill, and so he had to come. It must be a great change for a young man fresh from home.'

'Well, Padre,' said Mrs Travers, joining them,
'no answer yet from England. That shows that
you are to cast in your lot with us. We will have
Miss Rivers out, and Satong will give you a grand
wedding. We will have to get the up-country
missionary to perform the ceremony, as you cannot
be bridegroom and parson at one time.'

'The mail comes in to-morrow,' said Mrs Scott 'and we are hoping that some clergyman may hav been heard of.' That night Sidney was unable to sleep. There was a festival going on in the Chinese town; and, to one unaccustomed to it, the noise was perfectly maddening. When he came down in the morning Mrs Scott exclaimed at his appearance.

'Much as I should like you to stay, I must own that this place does not agree with you,' she said.

'News!' called out Mr Scott, coming into the room. 'The mail is in, and Downes writes that he has got a man named North, who is willing to come out here. Nothing of a preacher—a sort of bookworm, I fancy, willing to come because he is no hand at parish work, but quite unobjectionable. I fear that we can't really expect more. Now, what is to be done? Are we to telegraph to him to come, or will you consent to take the post, Sidney?'

'Nonsense!' said Mrs Scott. 'He certainly will set consent to stay. It is evident that this place does not agree with him. Can't you see how ill Arthur is looking? Telegraph at once.'

It seemed to Sidney as if the whole thing had paned out of his hands; the decision had been made for him.

'Well,' said Mr Scott, 'I believe you are right. I will go and see the church committee, and get the telegram off.—And look here, Sidney, you know we will be sorry to lose you; but the mail-boat goes out to morrow evening, and as the heat is increasing ladvise you to take it.'

Sidney found his farewell visits trying, and was glad that they were limited to one day.

Mrs Travers burst into the Scotts' the next morning.

'And so you are really off, Padre! Well, I suppose it was too much to ask you to stay here. See, I have brought you a few cups to help to furnish your Loadon house. A Chinese Johnnie sold them to my husband, and I think you will find that they are different from the rubbish of the bazaars. I wish you could have stayed, Padre, 'she continued, laying a hand on his shoulder; 'but you won't forget us, will you? And when you get back to dear, cool, clean England, say a prayer for the poor sinners condemned to frizzle out here.' And before Sidney could reply she was out of the room and tearing down the road in her dog-cart, stattering the terrified Chinese before her like leaves in the wind.

The mail-steamer throbbed its way slowly among the islands that lie round Satong; yet when they had been a couple of hours out at sea Sidney already left better, for the breeze was something quite different from the warm, damp air that played round Satong. That night when he sat down in his cabin he took up his Bible, and, opening it at random, his eyes fell on a marked passage: 'No man having put his hand to the plough, and looking back, is fit for the kingdom of God.' How well he remembered marking that passage! It was at the time of his ordination, when he was full of high resolves and great purposes, when life was too short for all he meant to do for the glory of God; and as for 'looking

back,' such a possibility did not even come within the horizon of his thoughts.

But as he gazed at the words before him a cold conviction seemed to benumb his heart, and he realised that in turning his back on Satong he had turned from the call to a great sacrifice. opportunity for complete self-renunciation had been laid before him, and he had turned to follow his own desires. His brain seemed clearer now than it had been in Satong, and he could see that it was the desire for congenial work, the work in which he knew himself to be successful, that was taking him back to England, not the desire to win souls to Christ. He had stifled the Interior Voice that had whispered of self-sacrifice; he had looked back, and the bitterness of the realisation was such that at that moment Sidney would have given years of his life to be able to stop the engines and step ashore again at Satong!

But life is full of decisions that, once made, can never be altered; and Sidney felt the beat of the engine that carried him on, and he knew that with his consent the telegram had gone that summoned Mr North to Satong.

He flung himself on his knees. 'I have sinned, O God!' he cried. 'But by my life I will show my repentance. I will spend and be spent in Thy service.'

CHAPTER VIII.- COOL, CLEAN ENGLAND.

HEN Sidney arrived in England his relations were shocked at his appearance, and were inclined to blame him severely for having stayed in Satong, in spite

of his representations that he had had medical permission to do so.

A friend made the offer of a small Devonshire living for a year, and it was decided that his marriage should take place at once, and that he should try what the country would do towards re-establishing his health.

During the year of Sidney's absence Ethel Rivers had developed very much. She had always been a girl of high religious purposes; and having met with some enthusiastic missionaries, she had become imbued with their zeal, and work in the foreign mission-field became her ideal of life. She had been quite excited when she heard that Sidney was staying at Satong, and on his return was full of questions as to the work carried on among the native population.

'How I envy you,' she said to Sidney in one of their first long talks; 'how I envy you seeing such places! Oh Arthur, how lovely it would have been if the Satong people had asked you to stay! And then I would have come out to you, and I could have done something among the Chinese.'

'I am not sure that you would have found it so lovely as you think,' replied Sidney. 'Things are apt to look very different from a distance.'

'Oh, I know all that,' she exclaimed impatiently,

'and how people talk of the disappointment of missionary life; but, all the same, I know that I should like it. Did you ask them to let you stay, Arthur? Why would they not have you?

'Have me?' repeated Sidney. 'Why, of course they would have had me. But there were many things to be considered. The new man must be there by now;' and he passed on to other topics. But when she left the room he hid his face in his hands with a feeling of indescribable shame. Had he told a lie? He was not sure whether he had or not. He had said nothing untruthful, yet certainly he had not told her the exact truth, the simple fact that the people at Satong had begged him to stay, and that he had refused to do so. He shrank from going into the matter with her, fearing her young, crude judgments and wholehearted enthusiasms.

""The heart knoweth its own bitterness," he said to himself, 'and however near two people may come, there probably is always some point on which they cease to understand each other.

The quiet and beauty of the Devonshire scenery were a great refreshment to Sidney. The deep lanes, the rich grassy fields with the slowly munching cows, the thatched cottages with the kindly, respectable people, all seemed such a contrast to the heat, the dust, the noise of Satong, where humanity appeared hardly higher than animal life. Yes, to live in Satong would be a daily trial, and it seemed to him that he was only now learning the meaning of the word 'sacrifice.' He had often dreamt of the sacrifices he would makehow he would give up luxury and cultivated society to live with the poor and be their servant; but he realised now the vast difference there is between the self-sacrifice a man chooses for himself and the sacrifice he may be called on to make, and how the heart that is strong for the one may shrink from the other.

One day he and his wife were sitting on a grassy bank, with a volume of Browning which he was reading aloud. In front of them was the blue sea, with red cliffs stretching away in the distance.

Sidney laid down the book.

'It is a perfect shame to read aloud here and break this heavenly quiet,' he said. 'I feel as if I were in the land of the lotos-eaters. I should like to lie on this bank for ever.'

'My dear Arthur,' exclaimed his wife, 'what a speech for an energetic man like you to make! Why, you used never to keep still, and were always thirsting for more work.'

'I hope I may yet thirst for work,' said Sidney. But sometimes I feel as if I had undertaken something that is too high for me, beyond my

'Too high for you!' said his wife indignantly. 'If it is too high for you, who is able for it? You know how much the Bishop values you, and the congregation in London are longing for your

'The praise of man,' murmured Sidney, 'how return.' little it is worth! Promise me, Ethel,' he exclaimed, suddenly sitting up-'promise me that if I die you will put the words "An Unprofitable Servant" on my grave. Ethel, I beg of you to do this.'

His wife was deeply vexed, and she found it difficult to understand Sidney in these moods. Her religion was of the cheerful kind; and why a man who was devoting his whole life to the furtherance of God's kingdom should ever be despondent and introspective she could not understand. Sidney appeared to her to have changed, and she did not hold the key to the workings of his mind. She soon found out, however, that he disliked talking of Satong. He would willingly tell her of Japan, or of life in Canada; but whenever she asked him about the inhabitants of Satong he would change the subject. What had happened there, she wondered, to make him look grave at any mention of the place? And she sometimes thought of frankly asking him the reason. Yet she shrank from making a charge of concealment, and tried to banish the matter from her mind.

It was a small matter, but it formed 'the little rift.'

(To be continued.)

SPAIN. TOUR IN LITTLE

PART II.

18th October.

before daybreak, as the small steamer that was to take us from Algeziras to Gib. was timed to leave at seven. We landed an hour later, and went up to the Royal Hotel, through the only street that can

My companions bear that name in Gibraltar. went off to Tangiers, but I preferred remaining at Gib., wishing for a little quiet after all our recent peregrinations, and also to see Victor Ward, who, I heard, was to leave for England that after-

noon. As it afterwards turned out, the troopship in which he had taken his passage did not start for another day, and we were able to be together a good deal. I dined with him at his mess, that of the Rifle Brigade; there I met an old Etonian contemporary, Monty Curzon, also little Mount Charles.

18th October. - With Victor Ward, Mount Charles, and Monty Curzon visited the lower galleries. These artificial passages in the rock are extremely picturesque. What has most impressed me here has been to see the Ninety-third Highlanders marching through the narrow Spanish street, their band and pipers playing with might and main, making the old Moorish walls to rock with the sound of their pipes. All that the English have done here since their occupation in the way of building is hideous; one can see no greater contrast than the old Spanish, if not Moorish, gateway, with the arms of Charles V. above the entrance, and the ugly low buildings which stand beside it. Gibraltar is, however, a place that every Englishman should see; and I certainly do not feel inclined to agree with Gladstone in his wish to give it up to such a decayed power as that of Spain. Let us keep it as we have got it, although what possible good it could do us in the event of a European war is not very easy to see. It is, for all that, a grand thing to have and to hold.

19th October.—V. Ward drove us as far as one can drive round the rock, to Catalan Bay and on to Europa Point. I have now a good general impression of this place of war, and do not regret having come; but I still regret the shortness of our stay at Seville. I went to early morning service at the Governor's chapel, where the band of the Rifes performed the part of the organ, and so well that I at first thought it was an organ and bot fidles and trumpets that played the grand Old Hundredth.

20th October.—My friend has returned from Tangers. He found that place inconceivably foul and dirty, a bad hotel, and the look of the natives so ferocious that he hardly dared stir out. Another perfect day, ending with a beautiful sunset of gray and rose-coloured clouds, against which the graceful line of the Spanish hills stood out in deep purple. I saw V. Ward off in the troopship Himalaya. Later again to Europa Point, which I think has one of the finest views of sea and rock that I have ever looked upon.

21st October.—This is our last day at Gib., which lam sorry to leave, for it is one of those places that have a charm about them for which one cannot quite account. I fancy there is something in the glorious *a-view and the freshness of the air that accounts for this, and also it being unlike any other place; or although I am now and again reminded here of Naples and Hong-kong, it is different from either of those places, far cleaner and pleasanter than the former, and not having so picturesque a harbour or such a wonderful chain of rugged mountains facing the town as the other. This morning we rode on donkeys to the signal station, after passing through the lower and upper galleries. The They from the station is superb; perhaps the most triking point is that from a narrow ledge of rock. On either side of this ledge not more than a few bet wide the cliff shelves down almost sheer, and above towers the colossal peak of marble, brilliant thite against the deep-blue sky. This peak is a tural pyramid, with its head in the clouds and its feet in the sea. I bought Drinkwater's account of the great siege at a bookseller's here. I had lunch with Lord Conyngham's son, Mount Charles, a small, dark youth of two or three and twenty, with a remarkable double voice, beginning a sentence in a deep bass and ending it in a high treble. We did some shopping, getting a few Moorish things for presents. Mount Charles's room in the barracks is full of such knick-knacks. Later we had a sail, and went out far enough to have a good general view of the grand old rock.

22nd October.—Left Gib. at six this morning in a small steamer. The great rock stood in relief as clear and as distinct against the morning sky of blue and pink as if cut out of pasteboard; very different from its appearance when we saw it first, dim and indistinct, with a great cloud over it like a pillar that enveloped and clung round the top of the great rock. A lovely day and a smooth sea. We reached Cadiz this afternoon at four o'clock, and put up at the Fonda de Paris, a by no means bad hotel.

23rd October .- From Hare's book and other guidebooks, we had not expected to see much of interest in Cadiz. However, as luck would have it, we came in for seeing and hearing one of the finest church services that we have yet witnessed; for this day is the great festa-day of Cadiz, when the titular saints of the town, whoever they may be, are solemnly worshipped. An ancient laquais de place of some eighty years of age, who told us his name was Somerset, and that he was the son of an English captain who lived here in 1810, showed us the way to the Cathedral, where the very high and mighty festival was in full swing in honour of the patron saints of Cadiz. The scene within the magnificent Cathedral was highly picturesque and really imposing. A procession of priests was formed, in the centre of which walked the bishop dressed out in full canonicals. The procession marched round the building, following two hideous bedizened life-size dolls placed within thrones and with palanquins above them, glittering with scarlet and gold; clouds of incense ascended to the lofty roof, and splendid music rolled along the mighty aisles. The ceremony lasted an hour, during which I remained in the church, and not until a corpulent priest ascended the pulpit did I leave. Later, I went to see Murillo's last work—an unfinished picture, exactly as he left it when he fell from the scaffold he was working on, receiving injuries from which he died a few days after. This painting reprehe died a few days after. sents the marriage of St Catherine, and is unworthy of the master. We left Cadiz at three, and arrived at Seville at nine. This time we are at the Hôtel de Paris, where we have better rooms than at the Quatro Nationes, and here I hope we shall have a week's quiet and a rest after our wanderings.

25th October.—A thundery day. To the Cathedral before breakfast, and at last succeeded in seeing the 'Sacristia Major.' Not worth the pains, however, were it not for the two noble hife-size portraits of

San Leonardo and San Isidoro by Murillo. These I greatly admired. A very powerful painting by Campana, a group of Holy Women at the Foot of the Cross, has much of Michael Angelo's manner, of whom Campana is supposed to have been a pupil. The sacristy is a gorgeous temple of carved stone, but the reliquaries and the little temple in silver, the delight of touts and tourists, are but tinselly and gorgeous rubbish. Later, I went with a guide to see the house in which Murillo died. One cannot see the interior of this place. It is in a narrow court facing the old Moorish town-walls. It stands in what was formerly the Jewish Ghetto; to get to it you have to pass through streets so narrow that two stout persons could not pass through them abreast. Close by is a larger house. In the interior of this building is a suite of rooms covered with pictures; and at the end of these rooms is a small one in which the great painter is said to have It has only a single window, with a worked. delightful view from it of an orange-garden. The Moorish walls in front of these houses are those of the Alcazar, in which are stowed some eight hundred religious paintings, spoils of the churches; among all these only three are of remarkable merit, but all three are of great beauty. One is a half-length-size painting of our Saviour, crowned with thorns and His hands bound and crossed; it is one of the finest Murillos in the world. I longed to be able to get it by hook or by crook, but my guide told me that the owner, a Signor Perpero Jacobo, had refused to part with it to a Frenchman for twentyfive thousand francs. Also visited the Church of St Isodoro, in which is a fair painting over the altar by Raelas.

27th October. - It poured in torrents. One experienced that nothing can look more wretched and dismal and uninviting than a Southern city under a damp sky; and Seville is particularly dreary in wet weather, as the spouts from the houses and the many gargoyles on the churches scatter streams of water from above on the pedestrians beneath. Even indoors one was not out of reach of the watery element, as I found to my cost, the rain coming in from two holes in the ceiling of my room to such an extent that pots and pans and baths had to be on the floor to receive the shower, and this in an hotel which has only within a week been reopened and renovated! Partly owing to this uncomfortable state of affairs outdoor and indoor we decided to leave for Granada the next day. I returned for a last look at the Cathedral, got some photographs, and tried in vain to find a curiosity shop.

28th October.—The rain continued. We left Seville at nine this morning, and by train to Cordova, where we changed, and then sped slowly on to Granada, where we arrived at ten that night. The latter part of the route lay among savage and wild scenery. We are at the Hôtel of the Siete Suelos, which at first sight does not produce a very agreeable effect; wretched little rooms

and a general air of neglect and uncleanliness about the people and things in it. The Hôtel Washington Irving is opposite ours, but it is said to be inferior. We found on arriving here our two French friends, but they were on their way to Madrid.

29th October.-It unluckily rained most of this our first day at Granada. We visited the Generalife and the Alhambra. The former is little more than a series of gardens perched upon terraces which command lovely views of the red towers of the Alhambra and of the neighbouring country. No one can, I think, be disappointed with the Alhambra, even seeing it as we did on a rainy and gray day. Its courts and galleries fully come up to the expectation I had formed of it. Now and again we had a rare glimpse of sunshine which illuminated the old red chambers most exquisitely adorned. The entrance to the Ambassadors' Hall and the Hall itself, in which Columbus was received by Ferdinand and Isabella, struck me most. An artist could easily fill his time and portfolio with numberless subjects here; for he need only look Altogether, I think the Alhambra and around. Venice the only places of which I had heard and expected much, but which on seeing have in no way come short of my expectations. The restoration seems to have been skilfully carried out, but ugly fissures appear in the walls of some of the principal halls, and this makes one fear that before very long much of what still remains may fall and be lost. We looked in at the Cathedral, a fine but somewhat scenic building. It was too dark to allow of our visiting the tombs of Ferdinand and Isabella. Almost the loveliest impression I shall, I think, carry away with me of this place is the view of the Alhambra from the topmost terraces of the Generalife's gardens. immensely lofty gray-stemmed poplars with their golden and green foliage, with the square red tower of the Palace towering above, is a never-tobe-forgotten sight.

30th October.-Thank goodness we have had a better day; and, although showery, that did not We commenced by interfere with sight-seeing. visiting the royal tombs in the Cathedral. Above rest the gorgeous sculptured monuments; below, the coffins. No spot in Spain is fuller of artistic and historical interest than those tombs in this chapel; very striking and effective are those leaden coffins with their little vault. 'A small place for so much greatness,' as Charles V. remarked while gazing on them. Later, we drove to the Cortuja Monastery-hardly worth the time it takes to go there; one regrets every minute taken from the Alhambra. There are grand views from the top of the terrace before the church; but here, as everywhere in Spain, the place is infested by beggars. We returned in time to hear the organ at vespers in the Cathedral; visited the 'Salon,' a pretty avenue with a fine panorama of hills all purple and blue against the snowy mountains of the Sierra Nevada towering above. In the evening we listened to the King of the Gipsies playing on a guitar as one had never heard that instrument played before, and saw some of the gipsies dance. To the Alhambra after moonrise. After ringing at the bell of the door near Charles V.'s palace, we were admitted with some difficulty, not having a pass from the chief custodian, Signor Conturno. Nothing that Washington Irving or Theophile Gautier has written regarding the magic beauty of the Alhambra by moonlight can give an idea of the effect of a bright moon in these marvellous courts and halls. It passes all words and expression. We revisited the whole building, going up to the 'Queen's Dressing-room,' from whence the view of the town below all twinkling with hundreds of lights, with the surrounding hills and the glorious Sierra Nevada looking more like a bank of intensely white clouds than palpable mountains, was unspeakably glorious. So brilliant was the moonlight that the rich ochre-colour of the old walls, and even the colour of the roofs of Granada below, seemed almost as clear as by daylight. We lingered long, and we shall not easily forget this sary-like scene. I think had it not been for the civil but officious guides who accompanied us we would have passed half the night there. It was rather late before we returned to the Siete Suelos. It was worth indeed all the time and trouble one has to undergo travelling in Spain to have seen this wonderful sight of the Alhambra by moonlight!

31st October.—At length it is fine again. To the Cathedral, where a requiem—I think by Mozart—vas being performed. A service was also taking place in the Royal Chapel. The monument of sabella reminds me of that in the church at Iratham, both in expression and in the look of infinite and perfect peace, and even to the crossing of the hands. Walked up to the Campo Santo, a veriable Golgotha, full of human bones that lie sattered above ground. The view of the mountains, lower, made the nastiness of the spot bearable. Esturning by the outer walls of the Alhambra, we lessed half a hundred places that would make the 77 of a painter's heart. These walls and towers low and again recall Kenilworth.

In November.—A splendid service at the Cathedral.

Tas there from nine till twelve. A bishop, in all the pomp of mitre and crozier, sat on his throne; its singing admirable; priests ranged below the organ-loft; crowds of choristers who sang accommand the same of great age, and a couple of heralds were taleards on which the arms of Ferdinand and labella were embroidered. Across the Alhambra in the afternoon to the Dano, the gipsy quarter. One was not all the same of the

and November.—A day of brilliant sunshine,

and I have seen the Alhambra with a deep-blue sky showing through its elaborate carved windows and its courts illumined by the golden light; very beautiful, but not so beautiful as when, the other night, all the building stood out so clearly, and the old and modern portions of the building were fused in brilliant moonlight or lost in the deep shadows. I read Lockhart's book of Spanish ballads in the Court of the Oranges, and drew a pencil scribble in the book of the view from one of the arched windows in the Court of the Ambassadors. Two English ladies, a Mrs Galway and her sister, who are living in the Tower of Justice, took some of us to see a portion of the Palace not generally open to tourists; this was near our hotel. We went to the top of the Tower dos Infantos, from which one commands a splendid view; the interior of this tower is very handsome although very ruinous. We also looked into a neighbouring tower now undergoing restoration within; in this tower one of the Moorish queens is said to have been imprisoned for twenty years-almost as long as poor Queen Mary! About sunset we visited the gardens of a Mr Calderon, now much neglected, but with fine views and magnolias covered with fruit. This garden might be made into a perfect paradise if taken care of.

Barcelona, 8th November. - On the 4th, long before daylight, we roused ourselves to leave the most interesting and beautiful spot in Spain. Our small party was increased by Mr and Mrs Lock, Mrs Galway, her mother and sister, and by two jolly little sailor lads, Charlie and Reggie. The latter were leaving Granada to pass the colder months at Malaga; we branched off from them before reaching Cordova. We reached Cordova at ten that afternoon, and after a short halt there the train slowly traversed the country northwards. A fine sunset, succeeded by almost sudden darkness as in the tropics, and with also an almost tropically starstudded sky. At one A.M. on the 5th of November we reached Alcazas, some four hours from Madrid. This made one feel that our route was of the most circuitous description; but, having circular tickets, we were obliged to return all this way back in order to get to the eastern coast of Spain. The early sun shone on a fertile plain-the garden, or, as the Spanish call it, the Huerta or Orchard, of Spain. Endless groves of orange-trees filling the valleys of this part of the Peninsula, framed by lofty hills; it was one's beau-ideal of what Spain should and ought to be, but unfortunately is not. Fond as I am of reading in the train, I found I could only look as we travelled onwards at the everlasting groves of orange-trees and on the blue and purple hills. Near La Encina this orchard-like country was at its best. I remember no day in the train in which the scenery one passed through had given one so much delight. At eleven in the morning we reached Valencia, where we lodged at the Hôtel de Madrid, a thoroughly Spanish but not uncomfortable inn. The bedrooms are mere closets opening out of lofty sitting-rooms. There is not much to see at Valencia. The Cathedral is dark, small, and squalid; the public gardens uninteresting, except for some fine palms. In order to get to the sea one has to take a tram over a road inches deep in mud. Altogether, Valencia is a place which is well enough to rest at, after such a long journey as we had had direct from Granada, but certainly not a place to visit for any attractions. The museum is a vast collection of pictorial rubbish looted from the despoiled churches; among a thousand daubs but one or two paintings repay the franc one gives the guardian. But one of these pictures is a really fine canvas-a Spagnoletto; and, black and disagreeable though it is, like most of the painter's works it has great merit. It represents St Sebastian, and is worthy of a place on the walls of the Hermitage or of the Louvre.

6th November .- We left Valencia at noon, and had a beautiful railway journey across a perfect garden of a country-palm-trees, dates, olives, vines, and miles on miles of orange-trees, some with green, others with golden fruit, bordered both sides of the line throughout our course. We also passed many an old town and ruined castle, appropriate to the scenery all around, and what might well make the despair of an artist, outdoing the best scenepainter's fancy or what he could imagine if not realise. The grand old hill crowned with the Roman remains of Seguntum is not unlike Stirling in outline. We reached Tarragona about nine at night; there we stopped, as I was determined to see the Cathedral and the tomb of the Scipios. put up at the Hôtel de Paris.

7th November .- The Cathedral is somewhat disappointing here; there is a fine retallo and a good organ, but little else of note. We drove to the tomb of the Scipios along the shore. The tomb is now but a fine block of golden-coloured stone. The view from the walls over the Mediterranean is worth obtaining. The Spaniards have done their best to destroy all that the Romans and the Moors left behind them in this ancient city; but a fragment-near the modern prison, in which, looking down from the upper walk, one can see and hear the prisoners clanking their chains-remains of what must have been the most beautifully situated amphitheatre in Spain, if not in Greece, Italy, and Sicily. We left Tarragona at six that evening, and after a wearisome four hours in the train arrived here (Barcelona). We are in the most comfortable hotel, the 'Quatres Nationes,' that we have sojourned in since we left Biarritz. And, oh, the delight, after a month without any butter better than railway grease, to be able again to get real good eatable butter! What a terrible material animal one is! I own it with shame, but

I feel more satisfaction from the good things to be had in this hotel than from any of the old cities and cathedrals we have seen during the last month. This is a gloriously bright, picturesque town, with a main street running through it which appears to me, the Parisian boulevard excepted, to have none to equal it in any other town or city. This street is called the Rambla, a mile long, with a wide promenade in the middle lined on either side with tall plane-trees. There are carriage-drives on either side of the Rambla, and also a line for tramways. The whole of this street is alive with a not unpicturesque crowd, and on one side is a fair or market of birds and flowers. All this life and movement take place under the chequered shade of the plane-trees; an intensely blue sky above, and at one end of the Rambla an equally blue sea ends the view. The street terminates towards the sea in a flight of white marble steps reflected in the dazzling waters. The Cathedral here has filled me with a delightful surprise; I had not expected so perfect a gem as it is internally, like a small and glorified Westminster Abbey. The cloisters are small but delicious; the stained glass in the building is the most beautiful I have seen anywhere. The smaller churches of Santa Maria del Mar and Saint Just y Pastos (which is like an unrestored Sainte Chapelle) are both beautiful; in the latter a stream of rainbow-like light that crossed the building had quite a divine beauty in its effect amidst the surrounding gloom, as the light fell and glorified the old walls.

10th November .- Had a busy hour before breakfast visiting churches with a laquais de place. Santa Anna with its pretty cloisters; in these is a neglected garden full of the large white flowers that smelt so sweet in the gloaming at Cadiz, and which the people there called 'lilies of the night.' A funeral service was taking place in the church, so we were unable to see much of the interior; it looked sombre. We visited also the churches of San Pablo and San Pedro. The latter is a very curious building, said to be nearly nine centuries old. San Pablo, however, is even more ancient. It had a very interesting cloister; but this is now turned into a military barrack, and is utterly neglected and desecrated by coats of whitewash. The outside carvings on the church are most curious. Later on I visited the handsome but still unfinished university. My travelling companion left for Paris. After seeing him off I walked up with a guide to see Montjuich, the fortress which dominates Barcelona, and which was taken so pluckily by Lord Peterborough. The view of the town and the sea from the summit, just as the sun was setting, was well worth the climb. The following day I left Barcelona by sea for Marseilles.

A FLOATING SHIPYARD.

NE of the strangest types of craft ever designed has been completed by the United States Government for use in the Philippine Islands. The craft may well be called a floating shipyard, for it will not only lift the

heaviest warship completely out of water, but it contains the necessary machinery for making repairs, as well as store-rooms for plates, framework, and other parts of the ship which it may be necessary to replace. It is the greatest lifting mechanism ere designed, although the enormous power which it ererts is due entirely to the elements of air and water, steam-power only being employed to put these elements in a position where they can accomplish their task.

The mariner terms this marine monster a floating dry-dock, but it differs in many respects from any wher yet built. It must be remembered that the and or graving docks do not exert any lifting power. They are immovable, and a vessel is docked by entering them while they are filled with water. The gates at the dock-end are then closed and the water pumped out. When the cleaning and repairing have been done to the ship, the gates are opened, the water flows in, and the craft is thus floated. In the case of the Dewey Dock, as it is called, it is not hecessary to be located in any harbour, for it is a manumoth mechanical automaton. If the state of the sea permits, it will do its work just as well a thousand miles from land as adjacent to the shore. Suppose a battleship has been damaged by a projettile from the enemy, or her hull needs cleaning to remove the barnacles and other marine growth which have accumulated. The dock is sunk until sufficiently submerged to allow a foot or two of vater between it and the warship's keel-enough to allow the vessel to float above the pontoons without danger of striking. Then the ship is slowly guided between the dock walls. When she has reached a point where her speed must be checked, her engines are reversed and she comes to a standstill, with the further aid of the big cables passed from her to the great stanchions or posts set into the dock. In thort, she is moored in the structure just as if tied to a pier or wharf in a harbour.

Now comes a test of the mighty strength of the dock. Its bottom is an enormous tank made of seel plates over half an inch in thickness, and held in position by a framework of steel girders which ran zigag throughout the structure. This tank is divided into compartments, which ordinarily are raterlight except when they are filled from openings in the hull. Of course they are filled when the dock is sunk to allow the battleship to anchor; here says to do is to pump out the water in the bottom portion. The steam-pumps begin throwing it out from the sides in thick columns. As fast as

the water is expelled the air of course enters the compartments, and really by the upward pressure of the air or pneumatic force the enormous weight, ranging into tens of thousands of tons, is raised foot by foot until in less than four hours the huge seafighter is so far out of water that a man can crawl under her keel with his scraping-tool, and the shipwright take off or put on a plate or rib which may be far below her water-line.

Once out of water, the warship is ready for repairing, painting, or other needed work, just the same as if she were safely enclosed in a landlocked dock. If wind and weather permit, she can be kept high and dry for weeks or months—just as long as the valves are closed which control the inlet of the sea into the great hollow bottom. After she has been made 'spick and span' again, the valves are opened and nature does the rest. Not a movement of the engines is necessary in this process, which marvellously illustrates the force of gravity. The weight of the ship presses the dock down, aided by the filling of the compartments, until she is again afloat and can steam out of the novel repair-yard ready for duty.

But besides being able to lift the man-of-war or merchantman, the dock can actually lift itself, strange as this may seem. Not all can be raised at one time, but the great pontoon which comprises the centre section can be held out of water, so that it can be cleaned and repaired just as any other craft. This novel feature is due to the fact that the dock really consists of three pontoons each complete in itself. Those at the ends fit over the sides of the centre section, which in turn overlaps them at each end. In other words, the dock is a gigantic collapse box of steel, the two end sections sliding under the centre one when it is desired to dock the latter. The way this is done is to pump out the centre pontoon, then fill the bottoms of the ends. They sink until their shipreceiving decks are below the bottom of the centre. As their sides extend beyond the sides of the main pontoon, they can thus be pulled under it without difficulty. As a matter of fact, the end pontoons form miniature floating docks in themselves, as they can be sunk and raised separately and used for docking tugs, torpedo-boats, and other small craft.

A few figures will give a further idea of the immense size of this floating shipyard. From end to end it is five hundred feet long, but can be used for a vessel somewhat longer if necessary. It is one hundred and thirty-four feet in width from outside to outside of its walls, allowing a clear space of one hundred feet for ship-room between the walls. These walls are so wide in themselves that there is ample room in them for all the pumping machinery, as well as state-rooms for officers and crew, the machine-shop, &c. When the dock is submerged to the greatest extent, fifty-three and

a half feet depth of water is required. Possibly these figures give an idea of its really enormous dimensions; but from the bottom to the top of the tower-deck the side-walls actually measure sixty-three and a half feet in height, while the pontoons when merely supporting their own weight float in eighteen and a half feet of water.

The great pumps for emptying the hollow bottom are among the most interesting features of the mechanism. The main pumps are three in number. Each is connected to a compound engine of two hundred and twenty-five horse-power, and forces out a stream of water twenty-four inches in diameter. The discharge of water is controlled by wedge screw-valves, and for the main pontoon three inlet pipes of twenty-four inches, two of eighteen inches, and two of twelve inches are pro-These pumps are merely for the main vided. pontoon, each end being served by an independent system. Steam is supplied to the main engines by a battery of boilers calculated to develop nine hundred horse-power in all. The engines were designed especially for the dock.

The valve-house, as it is termed, somewhat resembles the interior of a signal station on one of the modern railroad lines, as the valves are controlled by a series of levers which are similar in appearance to those used for working semaphores and for throwing switches. The levers are connected to rods which extend downward through the walls, and are attached to the valves by movable joints. Connecting with each valve is also an indicator placed upon the roof of the controlling station. By means of these the dockmaster from his station on the bridge at the end can tell at a glance the valves that are open and those that are shut. Another interesting contrivance is a gauge by which the depth of water in any compartment is continually registered. The gauge contains a column of mercury which is controlled by pneumatic valves, in turn controlled by the pressure of water in the compartments. In all, twenty-four levers are required; but so compact is the mechanism that one or two men can move all the valves. It may be added that the controlling station is connected with the bridge, the officers' quarters, the engine-rooms, and other parts of the dock both by speaking-tubes and a telephone system, so that the valve operators are continually in communication with all parts of the structure.

As already stated, the dock has facilities for making repairs to a vessel if she is not too much damaged. The repair plant contains chisels and drills for cutting off and boring hull-plates. These are operated by compressed air. A swinging crane will lift the plates, frames, and other weights, and put them where needed. In the machine-shop are such appliances as anvils, vices, machines for finishing ship-plates, lathes, shapers, &c. The repair-shop is driven by its own engine, and is as complete as if on shore. Then there are the electric light plant; the galley, fitted out with a full set of pots,

pans, and dishes; as well as mess-rooms and staterooms as commodious as the passenger accommodation on some of the ships running across the Atlantic—all within the great walls. Even marble bath-tubs and shower-baths are provided. But as the dock is to be located in the tropics, arrangements have been made to keep the air between the walls cooled by revolving fans which are continually changing the atmosphere.

Here are a few more figures which show the capacity of the dock and its great proportions: It has been designed to elevate sixteen thousand tons weight to a height which will allow at least two feet of space between the keel of the ship and the ship-deck or floor of the dock, while it is expected to support a weight of twenty thousand tons when the lower deck of the dock is just level with the top of the water about it. When ready for service, with all its machinery aboard, the dock weighs ten thousand six hundred tons, the steel material it contains representing nine thousand two hundred tons, the machinery five hundred and seventy-six tons, water for boiler and plant two hundred and eighty tons, and the anchors and chains fifty tons. The space it occupies when sunk to receive a warship is equal to that of a vessel weighing thirty-five thousand tons.

THE CALL OF NATURE.

I HAVE the love of a thousand years coursing through my veins—

The love of the great pulsating sea, the love of the rolling plains;

My ancestors back in the ages past the whole wide world roamed free,

And the restless blood in my being that flows is the heritage left to me.

Though born and bred in the narrow streets and tuned to the city's toil,

My innermost soul hears Nature's voice, and longs for the reek of the soil;

For the feel on my cheek of the keen, cool breeze from the top of the pine-clad hill,

As the breath of God to me it wafts, my eager frame to fill.

I long for the trail on the restless sea, whereon my ship alone

Is the only vessel in sight to be seen, on its way to lands unknown;

Where the white-tipped waves beneath the prow derid-

ing pass me by,

To the sound of the wind in the creaking sails and the
lonely seabird's cry.

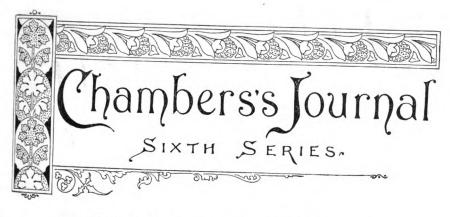

And I long for the tramp on the long white road, the road to a 'Better Land,'

Where the hedgerows glow with the love of life, breathed forth on every hand;

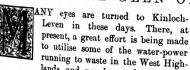

Where the face of a God, so oft denied, is seen through the shimmering haze,

And the voice of a great Creator seems to speak in a thousand ways.

ALBERT DE LANDE JOHES.

THE GLEN OF SAD MEMORIES.

lands, and people wonder what the outcome will be. New industries may be started; new communities may spring up. Work and the rewards of toil may be brought into the very heart of a desolate region. Which things, as Homer says, lie on the knees of the gods.' Before one reaches Kinloch-Leven one passes the entrance to the Glen of Sad Memories. There one might well pause to visit the spot and dwell for a little on the past ere proceeding to speculate on the future. The history of Glencoe was made more than two centuries ago;

that of Kinloch-Leven is in the making. In Scotland the picturesque and the historical are often closely associated. This holds good in a special degree of Glencoe. While its grandeur and beauty can bear comparison with any part of a romantic country-side, the memories which haunt it have cast a glamour of pathos over its physical charms. It is like a human face, beautiful in itself, but bearing a shadow of sorrow. In a district full of historical associations, it occupies a niche peculiarly its own. The tragedy enacted there has et a crown of thorns upon its head. It is impossible to dissociate the place from the event, and the Massacre of Glencoe—an old story now, and a sad one—has added a melancholy charm to a spot which nature has made ruggedly beautiful and Teirly grand. The very heather-bells yonder suggest drops of blood. The river creeping down the trough of the valley whispers of death and fate. The winds moan drearily among the hill-tops like the wailing and sighing of wandering spirits. Across the glen, gaunt, bare heights stare at each other, and their grim silence is more eloquent than words. They were witnesses once of a deed of thane, but they were helpless, and their lips are

Needless now to call for vengeance on those who planned and executed that legal butchery. The

guilty have long since gone to their last account. Seven generations have passed since the fatal February morning in 1692, when the deed was done the tale of which must lie for all time like a dark blot on the page of our history. We can only lay a stone on the cairn of those who fell, chief and clansfolk together, not in fair fight, but like hapless ones ambushed and cut down in their own homes. For fifteen days they had treated with Highland hospitality the soldiers sent down from the garrison at Inverlochy. These came with professions of friendship. Suspicion was disarmed, for the chief was assured that he and his concerns would come to no harm. The very evening before the massacre, Glenlyon, captain of the soldiers, and MacIan, chief of Glencoe, were playing cards together.

Next morning, long before dawn, the soldiers proceeded to carry out their instructions, orders far too clear to admit of any misunderstanding: 'You are hereby ordered to fall upon the Rebels, the MacDonalds of Glenco, and put all to the sword under seventy. You are to have special care that the old fox and his sons do upon no account escape your hands; you are to secure all the avenues that no man escape. This you are to put into execution at five o'clock in the morning precisely.' And this because MacIan was one day late, his misfortune rather than his fault, in appearing at Inveraray and taking the oath of allegiance to the king.

The night was tempestuous and snowy, as if Nature itself protested against this cruel wrong. The storm delayed a party of soldiers detailed to cut off the escape of any fleeing up the glen towards the wild Moor of Rannoch. Otherwise the MacDonalds had been caught between the jaws of a veritable death-trap and extirpated. Yet their plight was pitiable in the extreme. To remain in the glen was to invite destruction from bullet or blade, for the hearthstone was reddened with the blood of the host struck down by his treacherous guest, and the torches were thrust in the thatch. To flee to the moorland seemed little better than going forth to meet death in a kindlier form,

[All Rights Reserved.] MARCH 23, 1907. the dreamless sleep of those who lie down weary on the snow and never arise. When the gray dawn looked over the mountains it revealed a sight of smoking ruins and murdered glenfolk, a rude testimony to the triumph of the arm of law and order. Surely a dies iræ for the MacDonalds! Doubtless the soldiers had to obey orders or take the consequence; but what of those in high quarters responsible for the issue of instructions which culminated in such a dastardly deed?

Still to this day the memory of that sad morning haunts the glen. Seven generations, indeed, have gone, yet even now the wind in the corries and the Cona in its rocky bed seem to murmur a dirge for the fallen, deceived by fair promises only to be destroyed by hands that seemed friendly. Great towering hills stand watchers over the valley. From the Pap of Glencoe to the Shepherd of Etive they rise like a serried rank of giants to guard the spot and witness for the dead. Down below, the memorial cross at the entrance to the glen was scarcely needed to preserve the memory of chief and clansmen who fell together on that wintry morning. The ruined cottages sheltered by those frowning heights are eloquent enough. Moss and lichen are covering the fallen stones which once formed human dwellings, and time has wiped out nearly every trace of the massacre; but its memory abides. When can it be forgotten?

Could one dissociate Glencoe from the tragedy enacted there, the spot would still claim attention by reason of its picturesque and varied beauty. It leaves the shore of Loch Leven and steals gently inland between ramparts of hills, past trees and fields and human habitations, narrowing as it goes, till it reaches Loch Triochatan, a lonely little lochan of sad aspect, forlorn in its cradle of mountains. Thereafter it climbs more boldly over harsher and more naked ground under the shadow of the Three Sisters—bluff-breasted stacks of rock—until almost at the feet of the Shepherd of Etive it broadens out and merges itself in the heathery wastes of the great Moor of Rannoch. Few and far

between are the human abodes in this upper portion, and seldom, save when tourists invade its solitudes, do the heather and rock feel the footsteps of man. Nature, changeable as a woman, is mistress there in all her wildest and grandest moods. In sunshine, with every ridge cut clear and hard against a cloudless sky; and in gloom, with every hill-top wrapped in a plaid of gray, silent mist; in drought, when the river dwindles in its bed and the watercourses are nothing but gravelly tracks down the slopes; and in rainstorm, when cascades are spouting over every rock, and Cona rises 'drumlie' and hoarse-voiced like an angry monster; with the winds hushed to silence on a starry night, or breaking loose under a threatening sky-whatever the conditions, Glencoe is always beautiful. For a right appreciation of its varied charms it should be seen in all its moods. It should be visited alone if one would feel the spirit of the place, and hear the tread of unseen feet, and reconstruct the tale of a day now dead.

In recent years Glencoe has been brought very near the centres of civilisation. A railway runs to Ballachulish, only a few miles away. Across the hills at Kinloch-Leven a great industry, with all the haste and noise of modern life, is coming into existence. They are harnessing the waterpower of the Black Water Lochs, which for ages untold has rushed with untrammelled freedom to the sea, and breaking it in for the service of man. So far the Glen of Sad Memories has escaped desecration. Neither its solitude nor its sanctity has yet been rudely violated. Doubtless, tourist and tripper wander there at times, drawn by that strange curiosity which must 'see all sights from pole to pole.' Their visits are only occasional. They pass, and the glen resumes its wonted quiet. Up in the high corries deer wander unafraid; ptarmigan flit from rock to rock; the buzzard and the hoodie-crow (scavenger of the moorland) seek out their food along the steeps. The great hills brood over their secrets and listen to the voice of Cona murmuring and rippling at their feet on its unending journey to the sea.

THE LORD OF THE MANOR.

CHAPTER XIX.

OR once in your life, I believe you are nervous,' May said. She was putting a few deft finishingtouches to Angela's toilet. 'You are pale, my sister; you are anxious over the great secret. There is

nothing to fear.'

'I believe I am,' Angela admitted. She stood contemplating herself dreamily in the long glass. She was dressed, as usual, in black; but she was not pale, and there was the most beautiful tinge of colour on her cheeks. There was a softness about her that was becoming, a gentle expression in her eyes. 'May, I have behaved badly. I'm glad old Craggs won that action.'

'I knew you would be sooner or later,' May laughed. 'But then, you see, I have been behind the scenes all the time. Never was a greater blessing in disguise. We do not deserve our good fortune; and, indeed, we have done nothing to earn it, if we except Aunt Gertrude. We have been perfectly satisfied with the fact that we are Castleraynes. People who are in business we have despised. This pride of ours ruined Aunt Ger-

trude's life; it looked like ruining yours at one time; and now you are going to become the slave of the Emollient!'

'You are ridiculous!' Angela laughed. 'Let us go downstairs.'

'Oh yes, you are. Why don't you be honest and admit it? You love Clifford Warrener, and he loves you. You know it. That is why you were so miserable when he kept away. Let us go down and welcome our guests.'

The curtains were drawn; the lamps, with their pink shades, filled the room with a rosy, subdued light. Angela had gathered the last of the roses; ther had been arranged in the old Nanking bowls, with sprays of asparagus fern—the whole place was ingrant with the dewy scent of them. Here and there a shaft of light broke from under the fringe of the shades, and touched up the sombre brownand rellow of a Reynolds or a Romney. From obscure corners old silver gleamed. There was something very restful and very artistic about The Towers dining-room, Clifford Warrener thought as he glanced around him. Small wonder that the Catleraynes would have found the parting like a slow bleeding to the death. But they were not going to part with it now; the danger was

Rarne Castlerayne stood expansively before the freplace. There was not the slightest trace of his recent affliction on him now; he was essentially master of The Towers, bland, self-satisfied, and let the colour of his speech was a trifle more sabdued than it was wont to be. Like the others, be was just a little restless. Brooke had begun discasing golf eagerly with May directly she entered; Warrener was bending over Miss Castlerayne's chair. There was a small lamp behind it, and the eternal bitting was in her hand. It was impossible for those hands to remain idle for long.

With fingers that trembled slightly, Angela drew the pink bud and a spray of fern from one of the Nanking bowls. She crossed over to Warrener and gently touched his shoulder. His eyes spoke wher; she read their message.

You have no flower, she said simply. 'I-I have brought this for you. It is from my favourite the in the garden, a tree that blooms for four months in the year. Do you remember that morning in June in the rose-garden when'-

Warrener remembered—ay, he remembered. His told Angela that too.

On that morning the first bloom came,' she tent on To-day I found the last one. thould like to put it in your button-hole for

There was no occasion for words; there was a effect understanding between them. It was a very betty and very graceful action of surrender. And Ann Gertrude did not fail to understand; she oked up with moist eyes.

I feel as if Clifford might be a son of mine, the mid. 'We have been talking of his father. So I am going to have my romance over again in a new form, Angela. Oh, I know! And Clifford is so very like what his father used to be when '-

They filed in to dinner presently, the dinner which Aunt Gertrude had planned with such loving care. Her approving eye swept along the table, lingering on the silver and crystal, the flowers, and the fruit still with the ruddy bloom upon it. So the meal proceeded till at length the cloth was drawn in the old-fashioned way, and the dark, gleaming mahogany shone like a brown pool with the orchards of fruit upon it. There was a moment's pause.

'I think,' Rayne Castlerayne began, 'that our young friend on my left has something to say. I hope he will speak freely. We have no strangers with us, unless we except Mr Brooke, whom I am exceedingly glad to see here to-night.'

'I-I hope I shall not be a stranger long, sir, Brooke said calmly. 'It rests more or less in the hands of your-I mean that circumstances have brought me into the conspiracy.

Clifford Warrener rose to his feet. He seemed to feel the gravity of his position.

'The thing began quite naturally,' he said. 'When I met the daughters of my father's old friend in London we saw a good deal of one another. I made up my mind to come and revisit the pale glimpses of the moon the first time I had a chance. Eventually I came down because Miss May sent for me. She wanted to know if I could do anything to rescue the fallen fortunes of the family. Forgive me, but I must speak plainly. I came; I looked about me; I gave my imagination free play. Perhaps it is a little fortunate that I am a poet as well as a man of business. I lay on the Common and reflected. Surely all that grand sweep of country was not intended to be wasted! What good purpose could it be put to, to benefit humanity and put money in the proprietor's purse at the same time? You see, I was bound not to ignore the commercial side of the undertaking. As I walked over the Common the inspiration came to me. I sent for my friend Brooke, and he was emphatically of the same opinion as myself. There was a fortune for the making without doing one single act to defile the Common or mar its natural beauty.

'One moment,' Castlerayne murmured. 'Why did you not come to me?'

'Because at that time you would not have been in sympathy with the project, sir,' Warrener said grimly. 'I am sorry, but I must be candid. I am certain you would have opposed it. Recollect how vehement you were against the hotel scheme. We had to contrive some way to render your opposition utterly powerless. Then the deus ex machina materialised in the person of Craggs. I wanted to do something for the hospital, and Craggs told me of his discovery in the matter of the charter. The hospital was saved. After that action was fought

I had only to get the consent of the hospitallers, and they were secured for all time. They gave me a perpetual lease of the Common on certain conditions, in return for which all income arising from the Common is to be paid to the hospital for ever. Before very long we shall be able to quadruple the hospital accommodation, to build a chapel, to make it one of the finest charities in this part of the world. But I am getting on too fast.

'Let me look to the great discovery. My discovery was that Castlerayne Common has the making of the finest golf-links in the world. Practically, nothing requires to be done to it; it is ready to play on to-day. In my friend Brooke I have the right man to make the place known far and wide. Whatever he writes about the game is law; and golf has become a British institution, one of the blessings of modern life. Any doctor will tell you that. Brooke says there is no place like the Common-it has everything. The golf will be perfect, the air delightful, the view unsurpassed in these islands. Close by we have aristocratic Hardborough, with its population of a quarter of a million. Within fifteen miles are quite a million and a half of people. We can command five hundred members at any entrancefee we like to ask for, and any subscription. There will be no difficulty in getting a station here, as the Great Midland are going to make a line to Castleford; and if we can show them that it will pay they will make a detour here. That is only a detail.

'I bought that piece of land above high-water mark. I was supposed to pay a fancy price for it; but I was in a position to accommodate my father's old friend here and do myself a good turn at the same time. I want to make that point clear.'

Angela bent her head over her plate. Her face had grown suddenly warm. It was very fine and noble for Clifford to take his revenge in this way. She knew that he was speaking now to her alone, that he would never allude to the topic again. Oh, it was a fine thing to have a lover like that!

But Warrener was speaking again.

'We shall get our station,' he said, 'and, therefore, there will be no trouble to reach here. Before very long Castlerayne Links will be known all over the world. Well-known players will come here and give the place their blessing; doctors will recommend it. All I want Mr Castlerayne to do is to give us the use of the Dower-House; it will make one of the finest club-houses in the kingdom. It is so old, so artistic, so fitting to the place. If we can manage that, our task is complete.'

'I am quite in your hands,' Mr Castlerayne murmured. 'I owe you so much.'

'Thank you sincerely,' Warrener went on. 'Then everything is done. The income from all this will go to the hospital. I promised you that not one single inch of the face of nature should be defiled, and I

have kept my word. Fortunes have been made in this way, and they will be again; but no greater fortune than lies in the splendid range of hills and heathery dunes that fringe the Common. To pursue the sordid side for a little longer, what is the present value of the land I allude to, sir?'

'Practically nothing,' Mr Castlerayne smiled.
'And I quite fail to see'----

'Oh, that is because you have not had the business training. There must be at least five thousand acres of that land. People with means will naturally want to come and live here; they will require houses. We will cut the land up into plots of good size; we shall be able to sell that land at our own price-perhaps five hundred pounds per acre. We shall be able to dictate terms as to the class of house to be erected. There will be no shops or hotels—as lord of the manor you will see to that. We will have red roofs to all the houses as well. You will forgive my dwelling so long on the sordid side of the question; but I wish to impress upon you the fact that your fortune lies yonder, beyond the Common. That fortune is assured; it is so certain that at this very moment I would give something like sixty thousand pounds for the land. You will be happy and comfortable here. There will be Castleraynes of The Towers for generations yet. And all this because of the cult of the little white ball! People say there is no romance in business. I have just given a practical demonstration to the contrary. In my way I am a philanthropist, for I have promised one of our lovely spots to the people for ever, and at the same time I have extorted a fortune from it. And this is the great secret unfolded at last. Let us drink properly to the Castlerayne Common Golf-Links.'

There was silence for a little time, a reflective silence that was soothing. Then Miss Castlerayne rose suddenly and gave the signal for departure. Her heart was full of happiness; but she saw little of the faces of the others, for her eyes were dimmed in tears.

L'ENVOL

The restoration of the Dower-House had been finished some time; Angela had been most interested in the furnishing of it. It had been a costly proceeding; but Warrener would not hear of anything but old oak there. He was justified in his extravagance, he said, by the fact that the club membership had filled in six weeks after the first of Raymond Brooke's glowing paragraphs in the press. The great gods of the game had been hurried down there to play matches, and the salt of the earth had gone away enthusiastic. Everybody, except the forty odd million who sat in the desolate darkness beyond the bunkers, was talking of the wonderful Castlerayne Links. The winter visitors from Hardborough had been over in shoals. There had been no trouble with the railway com-

pany; and all this blessed result for the simple reason that one of the Warreners had broken away from the old traditions and had gone into trade! Already, though not quite six months had elapsed, the roads in the new estate were made, and people were tumbling over one another to get the precious land. Castlerayne's bankers took off their hats to him. He was invited to the manager's room when he called. As to the rest, he trusted implicitly to Warrener's advice. He was even beginaing to learn the advantage and value of paying ready money for everything.

March was gone and sly April was at hand. The warm breath of spring came over the Common, where solemn men in red coats marched. There was no longer any distress or any calls for occupation at Castlerayne; the golf-links took all the casual labour that was to be had. A telephone line to Hardborough ministered to the natural comforts of the players.

Nothing had been forgotten. Warrener was ex-Plaining all these things to Angela. They had just been playing a round together. Angela had deemed it base ingratitude not to take an interest in this wonderful game that had so altered the face of the family fortunes. She was a very different Angela in these days, too; all her old haughtiness had gone. She began to be mildly amazed at her own growing popularity. Latterly she had won Cragge's approval, and after that there was nothing to strive

We've gotten our own, Cragge had said. There's a hospital now that is a hospital and and the land's been turned to the best advantage without harm to anybody. Our become comes from the soil, and the soil is none the vorse for it. Also, there is occupation for everybody. A little more of this kind of thing, and they'll come back to the land fast enough. It is i fine thing that Mr Warrener and myself have brought the squire to his senses.'

'li was very good of you, Cragga,' Angela said hambly. 'You always did your best. I dare say 100 will come to forgive me in time.'

Oh, you'll be all right enough when once you are married, Cragge declared. 'Mr Warrener will se to that. I always said as what you needed was masterful man, and you've got him. Not as anybody's told me as you be going to marry Mr Warener; my old spectacles ain't so old as they can't see that coming this long time.'

Angela beat a hasty retreat. She was terribly thaid of the old man and his tongue. Time was when she would have resented a speech like that; but the spring was in her veins, and she The at peace with all the world, and Clifford

There is one thing about golf, Clifford,' she said. the flung herself down recklessly on a sand-dune and took off her hat so that the breeze could play ore her forehead. 'I am quite certain that it is god discipline for the temper. I am the better for playing it. Don't you think that I have a better temper than I used to have?'

'I am quite certain of it, sweetheart,' Clifford replied. But don't you think that the sense of prosperity has something to do with it as well? There is nothing that sours the disposition like poverty, especially the poverty that oppresses the fallen family. I ought to know, for I saw enough of it in my childhood. Which reminds me I have been terribly neglectful of my obligations lately. I have practically lived here all this winter. have my own people and my own obligations to think of. I want you to come and share them all first, Angela. I want you to come down to my village and make friends with the workers there. I am anxious to introduce them to my

Angela's reply was probably suitable, for Clifford caught her in his arms and kissed her. There was an obliging dip in the sand-dune that hid them from view.

'Then let it be soon,' Warrener said. 'We can work all the rest of the year, and come back in the summer to Castlerayne. I shall build a house here, and I know that Brooke is going to do the same. Brooke told me last night that May'-

'I know,' Angela laughed. 'They are going to be married in June. And as I am the elder sister, I am not at all disposed to let my junior assume matronly airs before me; and that being the case, Clifford dearest, I shall be quite ready

There was no need to say any more. May and Brooke found them presently, and they went back to The Towers to luncheon together. They were going to tell Aunt Gertrude, but there was no occasion to do anything of the kind. By some instinct, Aunt Gertrude seemed to know. She kissed them all in the most natural way in the world.

'I know exactly what you are going to say,' she said. 'Don't tell me that I am crying, because I know that perfectly well, my dears. It is only because I am so very, very happy. I seem to have found a romance in my old age. I am living again in your happiness. And everything has happened in such a strange and wonderful way. I can't quite grasp it yet. Do come in and have luncheon, and try and keep me sensible. I hope you are not getting married before June, as I shall never have finished knitting those silk shirts that I had intended'

They all laughed together as they trooped into the dining-room. It was a tradition in the family that although Aunt Gertrude was always knitting she never finished anything.

Angela threw her arms round the elderly lady's neck and kissed her. 'We are very, very fortunate,' she said. 'But out of all our good fortunes, the greatest that ever happened to us was the kindly fate that gave us and kept for us our aunt Gertrude.'

THE END.

JURY. $\mathbf{B} \mathbf{Y}$ TRIAL

GOOD, contented, well-breakfasted juryman is a capital thing to get hold of. Discontented or hungry jurymen, my dear sir, always find for the plaintiff.' 'Bless my heart!'

said Mr Pickwick, looking very blank, 'what do they do that for?' 'Why I don't know,' replied the little man coolly; 'saves time, I suppose.' The 'little man' was Mr Perker, solicitor for Mr Pickwick in the world-famous breach of promise case Bardell v. Pickwick. But Mr Perker is not the only man who has tried to forecast the verdict of a jury in certain given circumstances. Said a late learned counsel, 'Give me a widow as pursuer and a railway company as defender, and I will tell you what the verdict will be without any regard to the evidence at all.'

Trial by jury is an ancient institution, and has been called by grandiloquent writers the palladium of the Constitution.' In England it has existed in a definite legal shape since the reign of Henry II., towards the close of the twelfth century. In criminal cases it virtually superseded trial by ordeal, although trial by ordeal was not abandoned until a century later. Trial by ordeal was a fearsome thing. There were several kinds of ordeal; but the three most usual in practice were that of hot iron, which the accused had to carry for a certain distance; that of hot water, where he had to take a stone out of boiling water in a pitcher; and that of the accused morsel, where he swallowed a piece of bread and prayed that it might choke him if he were guilty. Whatever be its defects, it may safely be said that trial by jury is a little more logical and much more satisfactory than trial by ordeal.

There was in olden times another kind of trialtrial by battle, which was not actually abolished until the reign of George III., although it had become obsolete long before that time. The occasion of its abolition was this: In the year 1817 Abraham Thornton was tried for the murder of Mary Ashford at Sutton Coldfield, in Warwickshire. The case is rather interesting. The couple had danced together at a village ball, and Thornton had gone to walk home with the lady. Next morning she was found dead by a pond, with marks of violence. Thornton, having been the last person seen with her, was apprehended and tried. He proved an alibi, it being shown that at the time when the supposed murder must have been committed he was many miles away. There was considerable dissatisfaction at the acquittal; and the young lady's brother, as her nearest relative, brought an appeal of murder. Thornton thereupon challenged him to the wager of battle, which Ashford declined, and the matter ended. Parliament, however, thought it proper that this ancient mode of trial should be formally abolished, and an Act of Parliament was passed.

And now to return to trial by jury. The theory which supports this form of trial is that every one has a right to be tried by his peers. The theory was long ago extended to questions of private right in England—that is, to what lawyers call civil cases, as distinguished from criminal cases. Trial by jury in the criminal courts of Scotland has been in existence for a very long time, and Sir Walter Scott in his Heart of Midlothian has depicted such a trial with remarkable fidelity. It is interesting to note, however, that the extension of the system to civil cases in Scotland was not made until the year 1815, and then only experimentally. An Act of Parliament with a very pompous preamble was passed in that year. This preamble set forth that trial by jury in civil cases would be attended with beneficial results to the administration of justice 'in that part of Great Britain and Ireland called Scotland. Scotland, 'the knuckle end of England,' as Sydney Smith playfully called it, would appear to have taken kindly to the new order of things, because in 1819 trial by jury was made a permanent institution so far as concerned certain classes of civil cases. It is doubtful whether Scottish lawyers are now fully convinced of the 'beneficial results' to which this Act of Parliament refers. Only the other day one august judge said that when he was an advocate and had a bad case he always preferred to have it tried by a jury; and, in what must be considered unguarded moments, other eminent Scottish lawyers have been known to speak somewhat disrespectfully of trial by jury as applied to civil cases. But then, as Sydney Smith (to quote him again) once remarked, 'some people would speak disrespectfully of the equator.

Even in England jury trial is not considered as above criticism. A witty judge once said, 'If you have a good case you are safe with a judge. If you have a bad one you always have a chance with a jury.' If this be true-and, personally, we think the learned judge was a little too sweeping-juries must have deteriorated since the days of Chief-Justice Fortescue, who flourished during a considerable part of the reign of Henry VI. That eminent judge described English jurors as 'honest, considerable, and creditable men, who value their character, who are neighbours to the parties concerned, to whom there can be no cause of distrust as touching the verdict they shall give.' He averred that 'the common people of England are better inclined and qualified to discern into such causes which require a nice examination than those who dwell upon their farms and are constantly employed in husbandry affairs, whereby they contract a rusticity of understanding.' The italics are ours. With all deference, as lawyers say, we think the learned judge was a little too severe upon the farmers.

There are important differences between England

and Scotland as regards trial by jury. In England the jury, whether in a criminal or a civil case, consists of twelve 'good men and true.' In a Scottish criminal case the jury, following a practice which has existed from time immemorial, consists of fifteen good men and true; in a civil case the number is twelve. In a criminal case in England there are only two verdicts possible, Guilty or Not Guilty; in Scotland there is a third, the muchcanvassed verdict of Not Proven. In neither country are jurymen paid for their services in criminal cases. In a civil case in England a common juryman is allowed five shillings a day for 'a view'—that is, for inspecting any property or thing in dispute—but otherwise he is, in law, not entitled to any remuneration. It is usual, however, in the High Court to give him a fee of one shilling, and in the counties eightpence.

Special jurymen receive much higher remuneration; but it must frankly be said that the scale of remuneration of English common jurymen is absurd, and one wonders why it is tolerated. Doubtless the scale was drawn up by some wiseacre in the Middle Ages; but in course of time, when the salaries of judges and court officials were increased, the poor juryman was forgotten. If so, why does he not agitate now? The fee in the County Court is one shilling per case, in the Mayor's Court twopence, and in the London Sheriffs' Court fourpence. Who shall say after this that the English are not a thrifty people? But English jurymen have been accorded some highly important privileges. The Act of 1870 by it down that they may, in the discretion of the judge, be allowed the use of a fire when not in Court, and may also be allowed 'reasonable refreshand, to be procured at their own expense.' The italics ire, once more, ours.

They manage these things a little better in Scotand In a civil case, jurymen get ten shillings per day for their services, and the litigants must, in addition, provide them with lunch. If two cases are tried consecutively on one day, and the same jurymen oficiate, they get ten shillings for each case. It would the be reasonable that the litigants should pay the alway fares of all persons cited as jurymen, whether bey are actually called upon to serve or not. En panant, and while we are on the subject of reform, may we suggest that the right given to each litigant to challenge, without reason assigned, four of the persons cited as jurymen should be abolished. In that case it would not be necessary to cite so many when only twelve are required, and an old and Fell-founded grievance would be much minimised. But the most important difference between an English and a Scottish jury is this: an English jury when returning their verdict must be unaniand if they fail to agree after a certain high of time they are dismissed and the whole procedings are begun again de novo before a fresh ing. This is a most expensive mode of administering justice. In civil cases, in order to avoid this

result, the litigants sometimes agree to accept the verdict of a majority. In Scotland the jury can always give a verdict by a majority, in civil cases after the lapse of three hours. It humbly appears to us that in this matter the Scottish system is preferable to the English. The English 'unit' rule was declared by Mr Hallam to be a 'preposterous relic of barbarism,' and Bentham denounced it as 'no less extraordinary than barbarous.' Reason and analogy are against the practice. In political and social matters the majority rule governs. In a court composed of three or more judges the majority dictate the decision. As an American judge once said: 'Many cases occur about which men can no more think alike than they can look alike. The diversity of opinion is not due to perversity of judgment, but to that honest difference of human opinions without which the body politic would become torpid and the State perish of the dry-rot. If unanimity were tantamount to infallibility there would be some reason for the rule; but there is no more infallibility in twelve men than in seven or nine.'

What are the functions of a jury? This question may be answered by saying that while it is the province of the presiding judge to lay down the law which governs the case, it is the duty of the jury to decide upon the evidence. They are called upon, as ordinary men of the world, to decide questions of fact, to answer a simple issue or issues. Is the prisoner guilty or not guilty? If the verdict be guilty, the judge in an ordinary case decides what the punishment shall be. If, however, the verdict be one of wilful murder the judge has no alternative but to pronounce sentence of death. In a civil case, such as Mr Pickwick's, the issue would be: Did the defendant promise marriage to Elizabeth Bardell, and is he guilty of breach of that promise? In this case the jury, if they decide in the affirmative, also assess the amount of the damages. We have, as yet, no Court of Appeal in criminal cases, but in a civil case there is a limited right of appeal. The court, however, will not interfere with the verdict unless they are satisfied that the jury have gone very far astray, or have been misdirected by the presiding judge. In such a case it is usual to order a new trial.

11.

A well-known King's Counsel avers that he finds juries pay more attention to the plaintiff's case than to the defendant's. They hear the plaintiff's case first. Their minds are then fresh and receptive, and take in the facts according to the plaintiff's version of them. These facts having found a lodgment, it becomes very difficult for the defendant to displace them. The vagaries of some juries are proverbial. Perhaps the verdicts of some Welsh juries are the most remarkable of all. In the celebrated case of Price v. Morgan, on the jury being asked in the usual way whether they found for the plaintiff or defendant, the foreman said,

'My Lord, we don't know anything about plaintiff or defendant, but we find for our neighbour David Morgan.' During the land troubles in Ireland it was often very difficult to get a satisfactory verdict from a jury, or indeed any verdict at all. A single juryman who stood out against his brethren could effectively bar the administration of justice. One thing that too often weighs with a jury in a civil case is the relative positions of plaintiff and defendant. The plaintiff is a poor man, badly injured we shall say, and looking very miserable as he appears in the witness-box, and, naturally, the sympathies of the jury are with him. The defendants are a rich corporation or a wealthy limited liability company, and can afford to pay damages. They will never miss the money. This view of the matter sometimes induces a jury to decide for the plaintiff, and they pay little attention to the crucial question: Were the plaintiff's injuries caused by the fault or neglect of the defendants? Juries have at times a very roughand-ready way of assessing damages. Each juryman writes on a slip of paper the amount which he thinks ought to be awarded. The figures are added up and divided by twelve, and the foreman announces the result as the amount of the damages which they award. Sometimes even stranger things have taken place after the jury have retired to consider their verdict. It has been whispered that juries have been known to draw lots or 'toss up' for the verdict when they could not agree.

A word must now be said for the poor juryman. His is a thankless task. He is called away from his ordinary avocation, often at great inconvenience to himself and others. To his honour be it said, he almost invariably responds to the call of duty. When he does not do so he is fined. He knows that to serve on a jury is one of the ordinary duties of citizenship, as imperative as his obligation to pay taxes, and often a great deal more irksome. Sometimes he must wonder why certain privileged classes such as clergymen, doctors, lawyers, and others are not called upon to serve as jurymen, and why these people, being themselves exempt, should criticise him so freely. Frequently he finds when he reaches the court that his services are not required. Meantime his day, or a great part of it, is lost, and he gets no compensation. If he is empanelled he is compelled to hear what may turn out to be a sordid, uninteresting case or a family squabble, and long before the day is ended he will feel unutterably weary of the iteration and reiteration of the same facts by witnesses and counsel. Some counsel (for Serjeant Buzfuz and his type are not yet quite extinct) do their best to-shall we say ?-'bluff' the jury, to appeal to their sentiments, to harrow their feelings, to minimise by every means in their power their opponent's case, and as a matter of course to magnify their own. Some of these pleaders are consummate actors. They draw pathetic pictures of their clients, and very commonplace human beings, sometimes even rogues, are made to appear as angels of light or deeply injured innocents, while fire from heaven is called down to consume their opponents. Sometimes a text from Scripture or a tag of poetry has a wonderful effect upon a jury. An irritable judge once referred to these orations as 'sympathetic speeches.' One barrister in his eagerness to win has been known almost to embrace the jury. The arts practised are indeed varied and ingenious; but it was too bad of one critic (now a judge) to refer to these arts as 'the whole bag of tricks.'

Counsel on both sides having spoken, the judge sums up; and if he does so in the manner of Mr Justice Stareleigh the jury will be more befogged than ever. Dickens, in his own inimitable way, says that his lordship 'read as much of his notes to the jury as he could decipher on so short a notice, and made running comments on the evidence as he went along. If Mrs Bardell were right it was perfectly clear that Mr Pickwick was wrong; and if they thought the evidence of Mrs Cluppins worthy of credence they would believe it, and if they didn't, why, they wouldn't. If they were satisfied that a breach of promise had been committed, they would find for the plaintiff with such damages as they thought proper; and if, on the other hand, it appeared to them that no promise of marriage had ever been given, they would find for the defendant with no damages at all.' No doubt the jury found this summing up exceedingly luminous and helpful! We do not say that many judges sum up in this way; but there is just a soupçon of truth in this pen-portrait, broadly farcical as it is. After such an oratorical effort well might some member of the jury have exclaimed, in the words of one of Shakespeare's characters, 'Let's kill all the lawyers!'

Most jurymen are solid, respectable, and intelligent men, fathers of families, and good citizens. Some of them are sharp fellows. We do not refer to the juryman in Bardell v. Pickwick who distinguished himself by asking whether there was any date on the placard, 'Apartments Furnished for a Single Gentleman,' which Mrs Bardell placed in her front parlour window. That man was not a genius. In a very well-known case, however, one of the jurymen was bold enough to put a few questions to the then Prince of Wales, now his Majesty the King. After counsel had examined and cross-examined His Royal Highness, a thrill of astonishment ran through the court when one of the jury 'rose in his place' and said, 'Excuse me, your R'yal 'Ighness, but I have one or two questions to put to you.' And he did put them, with the result that it was generally admitted that the questions were very much to the point, and were the very questions which counsel had omitted to ask His Royal Highness. That juryman was a credit to his country; and here let it be said that if we have been somewhat playful in telling humorous stories about jurymen, we are well aware that in thousands of cases juries have discharged their duties admirably. Indeed, we are convinced that capable jurymen are the rule and not the exception, whatever the wags may say.

'Should trial by jury be abolished?' This is a question which has often been debated by young gentlemen in church literary societies and elsewhere. Well, it might be asked, what are you going to substitute for it? In criminal cases the system works very well on the whole, and with the institution of a Court of Appeal it will probably work still better. No doubt, in a civil case the jury are more likely to go wrong than in a criminal case. The facts may perhaps be inextricably mixed up with legal questions, and the issue is not so clear. When the question is simply one of fact, as in a running-down case, or a breach of promise case, or a case of slander, it is quite suiable for decision by an average jury. If the

presiding judge be what is known as 'a strong judge'-that is, a really able man-he will make the issue clear to the jury. Without exceeding his functions in any way, he will give them light and leading by putting before them the crucial points and brushing aside what is irrelevant, and in nine cases out of ten the verdict will be a correct The system is not perfect, and we have one. touched upon a number of things where reform is necessary. Perhaps, too, the powers of the Court of Appeal in civil cases may stand in need of enlargement, and when these reforms are carried out we shall have a machine which will work a little more smoothly. Without being enthusiastic defenders of trial by jury, we may at all events plead that there is no pressing demand for its abolition, and that the merits of the system outweigh its defects.

AN OPEN DOOR.

CHAPTER IX .- THE SATONG MURDER

T was when Sidney had been about five years in London that the whole of society became interested in Satong. For a couple of years he had hardly ever heard the place mentioned, and then all of a sudden

mentioned, and then all of a sudden Satong and its inhabitants became one of the topics of the day.

'Tragic occurrence at Satong. Edward Neville, youngest brother of the well-known Countess of was murdered to-day by the son of Sir Harry penistoun. Both young men are known to have been living dissipated lives. The deplorable incident took place in a Chinese gambling-house.'

Such was the telegram which threw more than one house into deepest gloom.

It was a time when there were no events of importance going on in England, parliamentary business was dull, and the newspapers were hard up for want of good 'copy,' so that this news was just what they required.

Sir Harry Denistoun was well known in London; his name had often before appeared in newspapers and telegrams, but always as leading his soldiers to victory; a white-haired man, with a cheery toice and sunshiny presence, full of vigour and enjoyment of life, he was a welcome guest wherethe went.

Lady Denistoun was one of those gracious women who seem born to reign. In India she had been a botel for her charm and her hospitality. Scandal lowely and of good report flourished. The fast women were afraid of her, but the young men the seems of the

They had two daughters, who were popular in the large circle of old Indians resident in London; the eldest son was in the army, and the younger had been intended for the same profession, but had

failed. A friend of Sir Harry's offered a post in a business house at Hong-kong. Lady Denistoun did not like the idea of her boy going so far away, but she ran over in her mind all the people she knew at Hong-kong, and came to the conclusion that he would have many to befriend him.

'There's Colonel Green there,' she said to her husband; 'I am sure he would be kind to him. And the Hamiltons. You know, my dear, we really did a good deal for young Hamilton when he had fever, and they are not the sort of people to forget it.'

So the offer was accepted, and the boy sailed. Everything that love could devise was put into his box; and though years passed, in Lady Denistoun's mind he was always the blue-eyed, careless boy that kissed her on the ship, and gave a parting shout of 'Cheer up, mammy!'

And now she knew herself to be the mother of a murderer. There had been nothing to prepare them for the blow. Letters had become rare, and Sir Harry often grumbled at their meagre contents; but Lady Denistoun knew that writing was an effort, and declined to be alarmed.

'Young men are so inconsiderate,' she would say with a sigh; and the next mail would take him out a long, loving letter.

When the young man in the Scriptures went away into 'a far country,' did any one tell the old Judean father that his son was spending his time 'in riotous living,' or did each turn on his own way and say, 'Am I my brother's keeper?'

People did not go home very often from Satong, and of the few that met Lady Denistoun there was not one who had the courage to say to this gracious, queenly woman, 'Your son is acting the part of the prodigal. Go, rescue him.'

It is one of the theories of modern science that women have a much greater stock of reserve strength

1

than men, and are able to bear sufferings under which a man would inevitably sink. Whether that is the case or not, it is an undoubted fact that a severe trial which completely crushes the man often only serves to bring out unsuspected strength of character in the woman.

The news of his son's crime prostrated Sir Harry. In a few days he aged visibly; the brisk step became shuffling, and his voice quavery. He seemed to lose all power of action; and it was his brother who telegraphed out to Satong that a counsel was to be obtained, and no expense spared in the prisoner's defence. Sir Harry merely wrote notes to the secretaries of the many clubs of which he was a member, and asked that his name might be taken off the books. 'The father of a murderer is not fit company for gentlemen,' he said sternly to friends who ventured to remonstrate.

When the news came Ludy Denistoun shut herself into her room for many hours, but when she came out she was absolutely calm.

'You will have to help me, my dears,' she said to her daughters. 'Your poor father is quite bewildered; he can't grasp it. You understand that every expense must be cut down, for we do not know what calls there may be on us; and the voyage will cost a good deal. I shall start by the next boat.

'You, mother!' exclaimed the girls, looking at each other in utter amazement.

Of course, my dears. You did not think for a moment that I would not go to your brother, did you? Oh! it breaks my heart to think that six weeks must pass before I see him.'

'Then you will take one of us with you?'

'No, certainly not. You will both be needed at home; and there is the expense to consider, said Lady Denistoun.

Her husband tried to remonstrate, but she turned on him quite fiercely.

'Do you wish to rob me of my one and only help, Harry?' she said. 'If I could not go to him I should become mad. And, oh, think of Gerald in prison!'

In the morning Lady Denistoun went out by herself, and was absent the greater part of the day. She came back looking much exhausted.

'I took my rubies to ---,' she said, 'and asked what he would give me for them. him that they were considered fine, and that the Maharajah had given them to me. He offered fifty pounds, and I am glad to say that it covers the price of my ticket.'

'Covers your ticket! Nonsense, my dear,' said Sir Harry irritably. 'You must be making a mistake.'

'No,' said Lady Denistoun, 'no mistake. Of course I took second class.'

Sir Harry sprang from his chair.

'Amy, this is too much !' he shouted. 'My wife travelling among the lady's-maids and valets! I won't hear of it!'

Lady Denistoun smiled faintly. 'If there were !

a fourth or fifth class, Harry, I should travel by that—anywhere, so as not to meet people. I told the agent that any cabin would do, so long as I could have it to myself.'

Her daughters were amazed. The mother they knew was a woman who had hardly ever taken her own railway ticket-the kind of woman who is always 'met' and 'seen off,' and whose luggage is looked after for her. If by chance she went to Scotland alone, Sir Harry put her into the train, and a well-tipped guard was told to see that she had all she wanted. And now she talked of changes at Colombo and Hong-kong as if they were matters of everyday occurrence.

Sir Harry did not go down to the ship with her. Lady Denistoun would not allow it. 'He has never been in the second class,' she said. 'Why fix it on his mind that I am there? Let him forget it.'

As she parted from her daughters Lady Denistoun for the first time broke down.

'Oh girls!' she said, 'morning, noon, and night pray to God that that may not happen.'

And for the first time they realised that hanging is the fate of the murderer.

CHAPTER X .- MOTHER AND SON.

T was towards the end of April when Lady Denistoun arrived in Satong. The news of her coming had preceded her by telegram. The community hardly knew whether to be

'At any rate, they can't sentence him to death glad or sorry. with his mother in the place,' cried Mrs Scott; to which her husband replied that the law did not recognise the existence of mothers.

For various reasons the trial could not take place until a couple of months after the crime had been committed, and these weeks were a period of misery in Satong. Every one knew young Denistoun, and every one felt that possibly had he or she made more effort for him this might have been avoided.

As the time of the trial drew near the suspense became very great. In the club men talked together in low voices about the jury-list, and the one thought was how to get off this horrible business. A telegram summoned one man to Japan, and several talked of important business at Shanghai. But the authorities had some idea of what was going on, and a notice appeared in the papers to the effect that any one who failed to appear when summoned would be fined; no excuse of absence from home would be accepted, and any plea of illness must be accompanied by a doctor's certificate.

It was but a couple of weeks before the trial, when one day Mrs Travers burst into her husband's business-room, her face expressing extreme terror.

'Philip,' she cried, 'it can't be true! Oh, say it

Whatever is the matter, Nellie?' said he. 'What are you talking about?'

'They say that if that boy is found guilty he must, by law, be hanged, and the gallows will be erected in the garden of the Consulate. Oh Philip!' ahe shrieked, 'my room overlooks the whole Con-

'I wish you would not listen to all the talk that is going on, Nellie,' said Mr Travers angrily. 'How can they possibly know anything about it?

'Then, say you don't believe it. Tell me that it is impossible. No, don't turn away, Phil; look me in the face. Oh, I can see, you know it is true, and we shall see the gallows there under my room, and that poor boy will have to go up to it, and then '-

Late that night Mr Travers came to the Scotts' house. He entered the room abruptly. 'I've come to ask your help, Mrs Scott,' he said. 'My wife is nearly out of her mind. I can't get her to go to bed She says she sees the gallows already under her window. Unfortunately, it is a fact that they will probably have to erect it there. May I bring her to you ? '

Mn Scott was much shocked. Like many others, she had taken it for granted that if the young man was found guilty of murder he would be taken to Hong-kong, or even to England, to have the senknce carried out. That he would be actually hung in their midst had never entered her head.

Mr Scott, when appealed to, unwillingly allowed that the subject had been discussed, and that the legal opinion was that the sentence must be carried out at Satong. He strongly urged his wife to go across to Japan, and take Mrs Travers with her.

I would give anything to have you out of the place, Carrie, he said; 'for, to be plain with you, it is as clear a case of murder as ever came before a juy.

Mrs Scott refused point-blank.

'I can do nothing to save the boy,' she said; 'but, Ton, think of that poor mother arriving next week. I can do something for her.

And Mr Scott could not urge the matter.

The day before Lady Denistoun's arrival was a day of misery for Mrs Scott.

Of course I must meet her. I could not let her arive and find no one. But what shall I say? If she saks questions shall I tell lies? Tom, tell me, shall I pretend that he is going to get off?

But Mrs Scott might have spared herself all these anistics, for Lady Denistoun asked not a single question. She received all Mrs Scott's kindness with gratitude, and merely begged that she might be driven straight to the prison.

I am afraid that you will find your son not very well, said Mrs Scott as they drove along. 'He has had a kind of low fever, and seems a good deal Pulled down by it. In fact, the doctor says he is very weak, and is keeping him in bed."

There was no prison for Europeans in Satong. The offences committed there were generally of the nature of embezzlement and such crimes as admitted of bail; so that one of the Government

offices had been used as a temporary prison. The heat was very great; a punkah flapped in the waiting-room where Lady Denistoun stood for a few moments before she was shown up the great bare staircase.

When a door closed behind her she stood as if transfixed, gazing at the camp-bed in the centre of the room. There had been some horrid mistake. That gaunt, unshaven man on the bed was not her light-hearted son Gerald.

The sick man opened his eyes.

'Mammy,' he said after a moment's pause, 'is that really you? They said you were coming, but I did not believe it.'

Lady Denistoun sank on her knees beside the bed, and it seemed as if all the tears which had been held back so long were now unpent.

'Hold on, mammy! I can't stand much of that kind of thing; but how I wish I could cry too!'

CHAPTER XL-THE TRIAL

HEN at length the day for the trial arrived, every man whose name was on the jury-list received a summons to appear in court; and, after considerable chal-

lenging, twelve unfortunate men found themselves doomed to sit in judgment on the young fellow whom they had all known well.

The arrival of his mother roused Gerald Denistoun from the state of apathy into which he had fallen, and he was able to appear in court.

As the prisoner pleaded guilty it was expected that the trial would be a short one; but the learned counsel, who had come from a great distance to conduct the defence, was determined to leave no stone unturned that might mitigate the sentence from capital punishment into lifelong imprisonment. He first tried to prove that the crime was manslaughter and not murder; that the knife had been caught up impulsively, and with no intent to kill. But the evidence of a woman in whose presence the struggle took place showed that the two men were in the midst of a fierce dispute, and that after she had wrested the knife from him, young Denistoun had seized it again.

This line of argument having broken down, the counsel proceeded to prove that for some months the prisoner's mind had been gradually giving way from the effects of drink. This argument involved an investigation of the books of the hotel bar, and it was a distinct shock to the community to find what large sums of money went in drink.

The counsel spoke very strongly on the subject of 'chits,' the devil's own baits, as he called them, for by them men were blinded to what they were really spending; and for young, unreflecting men like the prisoner, the free use of 'chits' constituted a sure road to ruin.

When the doctor-a man who had spent many

years in the Far East-came to give his evidence, he said that this sad event had not been altogether a surprise to him, as he had felt sure for some time past that young Denistoun was gradually losing his moral self-control. He stated that he found that young men of a light-hearted and gay temperament were particularly subject to fits of depression, and in the Far East these fits are sure to grow worse unless a man is very strict with himself. doctor cited several cases of suicide which had been caused by nothing but low spirits, and he stated it as his deliberate opinion that young Denistoun was in that frame of mind that had he not killed his friend he would have very shortly killed himself. He believed that the murder did not proceed from any murderous intent, but from that loss of selfcontrol which may lead a man to commit sudden yet unplanned wickedness. But the doctor was not prepared to say that the prisoner was what could medically be called insane, nor was there sufficient evidence to prove that at the moment of the murder his brain was clouded by drink.

The counsel was a good man, and was filled with pity for the haggard young fellow beside him. When the evidence had all been given he made an eloquent defence. He did not attempt to palliate the crime, but he asked the jury to consider the temptations that had been brought to bear on inexperienced youth. He pictured the boy in his English home. 'What that home was like I do not need to tell you, for you have seen the sorrowing lady who has come so far to visit her son. You have but to look at her to know that evil and impurity never found its way into that home.' He pictured the boy's high spirits and love of adventure, the curiosity of youth which led him to many places where he could not fail to be contaminated.

'It does not seem right to speak evil of the dead, and yet I should be failing in my duty towards my client if I were not to point out to you the part which Neville played towards Denistoun. I declare to you that in the sight of God I would rather stand in the place of the murderer than of the murdered. We only recognise the murders of the body, but the eyes of God behold the slow processes by which men can poison and finally destroy the inno-Young Denistoun came out an cence of youth. immature and careless boy, with no one to act as a check on his follies, and separated from the guarding influences of home. He met with Neville, who found an interest in leading the younger man into vice. All that was good and true in Denistoun had died a slow death under the hands of Neville. The destroyed soul had turned against its destroyer.'

The counsel told the jury that in the prisoner they saw a broken-down man who was suffering from a perfect hell of remorse, for whom there was no future in the world, but who earnestly prayed that the revered name of his father should not be further disgraced.

During the days of the trial Lady Denistoun had

passed through what seemed like a lifetime of exquisite agony. She was a woman who was accustomed in all the trials of life to turn to religion for strength and comfort, and she had been fortunate enough to have earnest and spiritually minded clergy for her advisers. Thrown among strangers at Satong at a time when belief in God's guidance of the world seemed shaken, she had turned at once to the same source from which she was accustomed to receive help. To send for the clergyman was the natural step for her to take, and she did it fully expecting that Mr North would be able to restore some peace to her troubled soul.

He came at once in answer to her summons, but she soon saw that she was inflicting pain without receiving help. A mere bookworm, interested in the events of the early Roman Empire and such topics, Mr North had nothing to offer when brought face to face with deep mental anguish. He murmured a few words about 'this deplorable event' and 'submission to the will of God.'

'The will of God!' said Lady Denistoun, rising and confronting him. 'How dare you say that this is the will of God? It is not the will of God that is triumphing in Satong, but the will of the devil.'

And when, bracing herself to it with a supreme effort, she listened to her son's tale—the tale of the road to ruin—her soul was filled with a great indignation.

'Was there no one, Gerald, in all these years,' she asked, 'to remind you of an all-seeing God?'

'No, mammy,' he said. 'You see, I never went to church except on Christmas Day. North is such a dry old stick. When I came out there was a very different man here, called Sidney. He was an awfully good sort, and we all wanted him to stay. A number of men went to hear him who have never gone to church since. You see, we are not like you, mammy. You go and get good whatever old fossil is in the pulpit; but the fellows out here have no idea of going for the prayers. They go because they like a man; but it helps to keep them straight.'

'And this,' said Lady Denistoun—'this is called a Christian community.'

CHAPTER XII. -- THE SENTENCE.

N account of the great heat, the court held its sittings from seven o'clock in the morning. On the final day every corner of the place was full. A number of ladies were there, drawn by that overwhelming love of the sensational which takes people to see things

were there, drawn by that overwhelming love of the sensational which takes people to see things they even dread and dislike. Punkhas waved above, ladies pulled out fans and scent-bottles, and there was a rustle of expectation as seven o'clock struck. But neither judge nor counsel appeared, and when half-an-hour had passed the strain was so great that there was an oppressive silence. After an hour's wait a messenger arrived from the judge informing the jury that they might retire till sum-

moned. The general public did not know what to do; no one liked to go home; every one wished to know what had happened. After two hours had slowly passed, the judge was seen coming towards the courthouse. When the jury had taken their places he told them that he regretted having had to keep them waiting so long, but he had spent the time at the bedside of the prisoner. A sudden rise in his fever had been too much for the young man's feeble strength, and he had been unconscious already for some hours and was at the point of death. That being the case, the judge said he felt it to be an

unnecessary formality to proceed with the trial, and the jury might consider themselves dismissed.

The next evening a largely attended funcral passed through the streets of Satong. Several ladies accompanied Lady Denistoun when she followed her son's body to the grave.

After all was over, Mrs Travers went up to her husband.

'Come, Phil,' she said; 'I am going back to our own house. I want to take out the little chap's things. I know now why God let him die.'

(To be continued.)

LONDON AT NIGHT.

By LEWIS MELVILLE.

Dappreciate at its full value the quiet beauty of London at night it is necessary to mix with the crowd during the later hours of the day. Late on a summer afternoon enter

Hyde Park by Apsley House, and valk slowly to a chair within the dwarf railings opposite Stanlope Gate. Sit there and watch the sabionable and the would-be fashionable folk who promenade from Albert Gate past the Achilles statue to Groevenor Gate. If so disposed, indulge in a crnical smile as within half-a-dozen paces of each other you observe famous men and women and the unknown honourable people rubbing shoulders with not only the dishonourable but also with the dishonoured, the strong with the weak, the secessful with those who have failed: a true republic such as the most hopeful can only expect to be realised in dreams.

Remain while those around go home to dine. By half-past seven will have departed the last of the loungers who prefer the cooler air of the open gardens to the hotter atmosphere of the house. look well at the green lawns stretching far on tither side; the huge old trees opposite the lodge, with its beautiful creeper; the fuchsias, pansies, tal geraniums in the flower-beds across the road, continuing so far as the gardens of Hamilton Place; Dorrhester House, stately and impressive, with its tel gravel drive; and the delightfully situated houses of Seamore Place, overlooking the Park. Soon the carriages which had deserted the drive return, passing hurriedly with their occupants in full evening toilet. A little later, and note how the Park again becomes peopled, but with persons requited from a different class of society: men and women—chacun avec sa chacune—released from City warehouses, West End shops or offices, servants (their day out), with eager eye and unstately guit ll hastening from north and south, from east and vest, towards the bandstand.

London at night! How the phrase excites the imagination! How it suggests pleasure and all these ills that flesh delights in! The mind con-

jures up pictures of exquisite Bohemianism, visions of champagne and truffles, of an easy, devil-may-care life, full of joy and allurements, where cares cease from troubling and worries are at rest! London, however, is of all great towns the one it is most incorrect to regard as a City of Dreadful Night. Its places of amusement close at eleven, its restaurants and public-houses at half-past twelve. By midnight the streets are deserted, except for the small area between Burlington House, Leicester Square, and Charing Cross. By one o'clock silence reigns supreme; and the quiet solitude is disturbed only by the rattle of a cab, the voices of men returning from a club or a dance, and the heavy tramp of the policemen.

Leave the Park and go southwards. Londoner almost forgets that the Metropolis is situated on both banks of the river. In the daytime, to the man of business there is no river, only so many bridges. He remembers it only when he is in a hurry, because there is no short-cut across it. The man who lives in the West End, if he thinks of it at all, regards it as the line of demarcation separating the London he knows from the London with which he is acquainted only by hearsay; probably in the whole of his life he has never crossed the Thames except in a train. In the daytime, with its huge warehouses, its grimy barges, its tramp steamers, the river is an eyesore to the Londoner, to which he shows his dislike by avoiding most sedulously the fine Embankment. Rather than pass down the splendid boulevard, he makes a detour by way of the crowded Fleet Street, Strand, and Whitehall. But what a difference there is in the view at night! Let a man stand at midnight with his back to the town at the right angle formed by the Embankment and Westminster Bridge, and if he does not appreciate the wonderful picture let him for ever be set down a barbarian.

On the left is the massive, imposing pile of buildings wherein the Parliament holds its sittings, making laws that control alike those who live by the banks of the Ganges and those who dwell in the Manitoban forests. The beacon-light announces that the faithful Commons are still deliberating—doing non-contentious business, for Bills that are opposed are shelved temporarily when Big Ben strikes the hour of twelve. Wait a little and hear the cry, 'Who goes home?' a survival of the days when footpads abounded, and members for their safety proceeded in parties. Westward, in Palace Yard, stands the ancient Westminster Hall; and a few feet farther away looms out against the skyline, gloomy and stately, the historic Abbey. Through how many centuries has it endured the storm and stress of weather! Wheel about, and stand with back to St Stephen's Club, facing the river,

When the lamps quiver
So far in the river,
From window and casement,
From garret and basement—

lights from the terrace of Parliament House; on the Surrey side, lights from the great building of St Thomas's Hospital, from Lambeth Palace in the distance, from the many ships from the Bridge

of Westminster to the Bridge of Sighs.

Passing the new police-offices and the magnificent block of residential flats, Whitehall Court, catching a glimpse of the Horse Guards' headquarters, on to Northumberland Avenue, with its great caravansaries and its mammoth clubs, to Charing Cross with its memorial cross erected—how long ago!—by Edward the First in honour of his consort, the very name a corruption of chère reine. Down the Strand, where now only the names of streets record that here once lived the great families of Bedford,

Northumberland, Essex, Arundel, and many others. On past Waterloo Bridge and the palace of Protector Somerset, past the church of St Clement Dane's with its historic oranges and lemons, past the new Law Courts to the spot where once stood Temple Bar has gone, and only the Griffin marks the boundary of the City of London. Through Fleet Street, where Dr Johnson used 'to take a stroll,' tapping the railings as he went-the Turk's Head Coffee-House, where he used to rest, has been improved off the face of the land—and where the printing-presses are in full swing, and tired journalists may be seen making their way to the Press Club. On past the site of the old Punch office-with its memories of Thackeray, Leech, Doyle, Mark Lemon, Jerrold, and the others-to Blackfriars. Then up the Embankment again.

Te 1

. n

But now there are the herald signs of dawn. The clouds which have been sailing lazily over the moon's pale face have disappeared, and the moon itself is retiring for its well-earned repose. Comes the soft air of the morning, the rustling of leaves, the scent of the flowers in the Temple Gardens, where once were housed the Knights-Templar, whose duty it was to protect the Holy Sepulchre; the river streaming on, and in the distance the golden cross of St Paul's, on which gleams the first ray of sunshine.

Then suddenly awoke the clang
Of waking life, the streets were stirred
With country wagons, and a bird
Flew to the glistening roof, and sang.

AN EPISODE OF THE FOOTHILLS.

EAN CAMERON watched the cavalcade of riders fade away across the purple-gray reaches of prairie into the lemon-and-gold of sunrise. Her half-brother and his cowboys were off to a round-up; her sister-in-law

and niece were riding with them to a distant ranch. Jean was alone, and free to indulge the great wave of loneliness and home-sickness that oppressed her.

She leaned against the door-frame, and through that eyes saw the steep streets of her Scottish home, the stone cottages, the rippling harbour, the fishing-boats, the gray kirk, and the quiet graves. The long lines of level prairie, the sluggish river, the lush richness of nature, held nothing in common with that early home. 'The cry of the human' that comes to us in such moments rose to her lips: 'Be pitiful, O God!'

The words were so startlingly distinct on the quiet morning air that a man on his way to the house turned his horse quickly across the sward to the stable. From its lee he watched her with interested curiosity, and ten minutes later came whistling down the path with a cheery 'Goodmorning.'

He heard with apparent surprise that the men were off on a round-up, and the family away for the day. It was immaterial that she should know that he was well aware of this. He had met the whole 'outfit;' but this seeming ignorance made a chance for conversation.

Dalziel's ranch was in the foothills, and in the neighbourly way of the West he always stopped at the Cameron ranch to feed his horses and get a meal in his journeys to and from the railway station. To her he was only one of the many strong, prosperous men who enjoyed the Cameron hospitality, and who flirted mildly or desperately with pretty Ada Cameron. As for Dalziel, he had for months been accustomed to see her moving deftly to and fro in the Camerons' kitchen. He had never bestowed more than a very cursory glance upon her; their conversation had been restricted to monosyllables, and he had had no desire that it should be different. To-day he wished quite otherwise. That glimpse of the heart of the lonely woman had roused his interest.

He was in no hurry; the summer day was long; Jean Cameron was alone, and Dalziel proceeded to make himself agreeable. With nice

intuition he chose interesting topics of conversation, and was unaccountably elated to find that the usually silent woman talked with a freedom and ease that surprised him.

Perhaps it was the effect of the excellent dinner that she prepared, and of which they partook together, that sent Dalziel's mind speculating as to the future while his horses wandered lazily homeward.

That was the beginning; a friendship purely platonic and disinterested was apparently the result. Dalziel paid more frequent visits to the Camerons, brought books and magazines for Jean, observed her narrowly, and flirted openly with pretty Ada Cameron.

Jean would have scouted the idea that Dalziel was developing a sentimental interest in herself. She knew that he enjoyed their conversations, and there was a quiet pride in the thought that she was as well read as he. She was very modest in regard to her accomplishments. The emergency of a praiseless service in the little schoolhouse first taught the prairie-folk of the magic of her beautiful voice. 'We will praise God in the One Hundred and Twenty-First Psalm,' announced the missionary. Outside bees hummed and cicadas shrilled; but inside was blank stillness until Jean's glorious voice rang out: 'I to the hills will lift mine eyes.' Others quickly joined, led by the inspiration of her clear, flute-like notes. Dalziel, who happened to be present, listened with concentrated attention for that one voice, angry that the discordant jubilation of others should drown its sweetness.

Jean had some bitter moments that summer, generally after visits in which Dalziel had devoted himself to Ada; and once, harder still, when he had taken her for a drive across the prairie to the cut banks of the river. In the warm dusk of the summer night the shadows were purple-black in the river gulch, and the yellow fires of an Assiniboine encampment twinkled like stars in the darkness. The horses wandered at their own sweet will. He talked and she listened. She could recall every word. Perilously near to lovemaking it seemed. His voice was very earnest; there was something else in it, too, that made her tremble. She had suddenly braced herself at the thought that it was sentiment born of propinquity and the beauty of the night, something that Ada or girls of her age might indulge in, but quite out of date for a plain woman in her thirty-fourth Jear. The sudden change in her manner was most effective. Dalziel understood, or thought that he did, tightened the reins, and drove home through a chill mist, figuratively and literally.

He had thought about it many times since. Had he been on the verge of making a fool of himself? Would he have been a fool, after all? She would make a splendid wife for some one—the missionary, for instance. Dalziel's disgust at the possibility of such a contingency was intense.

He was perfectly willing that Ada should marry any one of her numerous beaux, but somehow with Jean it was different.

He smiled to himself as he remembered the swift rush of colour to her cheeks and the happy expression in her eyes when he had remarked on the becoming style of her coronet of fine braids. There had been a time when he had thought that he disliked red hair; lately—— She had worn a white dress that day. If she were his wife she could wear white every day if she wished; he would get it out from Scotland—woollen stuff, webs of it.

Then would come the remembrance of that chill drive in the mist. She was prim and old-maidish, and didn't care a hang for any one. In fact, he didn't believe that she could care; neither did he, and with a vicious slash of his whip the meditations would come to an abrupt close.

Dalziel administered what he hoped was salutary punishment to Jean by long absences. He was chagrined, too, at nearly always finding her away.

It had been a season of accidents, and Jean's skill in nursing had proved a boon in many a lonely ranch. The care and love bestowed upon others less fortunate than herself, the busy days, and outside interest were good for her, carrying her away for a little time from an atmosphere charged with possibilities of trouble.

One evening in the late summer Dalziel came to the Camerons' with a pitiful story. A neighbouring ranchman was down with typhoid fever. He had been living alone in a shack, no one to look after him, no comforts, dirt and huther indescribable. 'I've taken him home,' he said. 'The doctor has been to see him, and reports it a very bad case. He has telegraphed everywhere for a nurse, Victorian or otherwise. There is not one to be had. I have scoured the country in vain for help. My Galician man and his wife threaten to leave if'—— Dalziel stopped abruptly, and a painful silence fell upon the company.

There was no doubt about his errand. He wanted Jean as a nurse. Mrs Cameron looked at the slim figure in the doorway and realised that this would be different nursing from Hugh Carruthers's broken arm or Mrs M'Coll's baby. Besides, it was a house with no woman excepting the uncertain Galician.

Cameron, too, looked at his step-sister. He had grown fond of her within the past few months. He was not sure that he ought to sanction her going with Dalziel; and, besides, he had a mighty fear of typhoid.

Ada noted the eagerness and pallor of Dalziel's face, and the tremor of Jean's hands, and smiled.

'I shall be ready to go with you in half-an-hour.'

Jean's words broke the stillness like an electric shock.

There was an instant bustle of packing and preparation; many things to be remembered, and

comforts provided that were not likely to be found in Dalziel's bachelor establishment.

It was not until they were alone in the wide silences of the night that he tried to thank her. He was strangely moved, and his voice was broken and almost inarticulate as he made halting apologies for the discomforts she would have to endure.

The patient was awake when they arrived. Although unkempt and unshorn, he was still a handsome man. Dalziel did not observe the sudden pallor of Jean's face; and when she looked down upon the sick man her trembling lips again framed the prayer, 'Be pitiful, O God!'

The fever-parched voice, strained and quavering, called, 'Jean;' and at her murmured answer he lay quietly back upon the pillow with no further question, no surprise, only a great peace and con-

tentment.

The weeks that followed seemed but a hideous nightmare. Passing time was recorded by the doctor's visits. Brenton was very low, and needed the most constant attention. In his delirium he babbled of incidents familiar to both, his own name coupled with hers in the life of that far-away Scottish town; while Dalziel, consumed by jealousy, forgot that there had ever been a time when he had looked with pitying indifference upon Brenton's nurse.

Jean realised the difference in his manner, and guessed its cause. While Brenton remained critically ill she had been too busy and too anxious to heed it. Now, in the beginning of the long convalescence, she felt aggrieved at his cold politeness and avoidance of her company.

A woman with over-tried nerves and body is usually both irritable and unreasonable. Jean was no exception. The weather, too, was dispiriting; rain fine and penetrating had fallen unceasingly for three days, and the distant peaks of the Rockies and the long undulations of the foothills were completely blotted out. Weary in mind and body, Jean dropped into a rocking-chair beside the kitchen fire. The Galician woman knew the characteristically feminine mood, and respected it.

Dalziel was with the patient, who was in a grumbling frame of mind. Unused to the vagaries of women and of invalids, Dalziel unwittingly did the things most exasperating to both. He fussed back and forth between bedroom and kitchen, asking unnecessary questions and making vague remarks.

A last time he came. 'Brenton wants some broth, Miss Cameron.'

'Well, can't you give him some?'

'Yes; but he wants you.'

'Let him want,' snapped Jean, and Dalziel retreated with a lighter heart than he had known for weeks.

Jean did not know of a hurried conference the next day between Dalziel and the doctor; consequently she could not divine the sequence of Mrs M'Coll's timely visit. She came with her precious

baby, bundled Jean off to bed for two days, and, as she expressed it, 'put things straight.' During these two days she settled a number of questions that had vexed her downright mind. Just who Brenton was. When and where he had known Jean. Also, the story of his ranching ventures in the North-West. From Jean, too, she inadvertently learned much. And because all the world 'loves a lover,' and because she loved Jean and owed her a world of gratitude, she told Dalziel. An Englishman, well born and rich, Brenton knew Jean Cameron well a dozen years ago when she visited at his aunt's, a connection of hers. He married some one that his family did not approve; they quarrelled, and Brenton and his wife came to Canada. She died in the East, and he had drifted to the ranch.

What Mrs M'Coll did not tell, but perhaps guessed, was that in the sunny days of a long-gone past Brenton had made love to Jean. Carelessly, idly, he had won the young girl's heart, only to fling it away. It had been a pastime for him soon forgotten, but an episode that had been as apples of Sodom for Jean.

Lying in the little, bare room in Dalziel's house, listening to the fretful voice of the invalid downstairs, she found it difficult to realise that there had been a time when that voice possessed the power to make her happiness or despair. Her heart beat quickly as she thought of the difference in her mental outlook that a few short months had wrought.

In the late afternoon of the third day the weather cleared. Looking from her window, she saw the tops of the Rockies standing out from the nist-wreaths like points of burnished gold. An Indian family with pony and trailing traveis were silhouetted against the purple shadows of the foothills. During the long weeks of her nursing the harvest had been garnered, and now the stubble-fields were alive with migrating birds. Away in the distance she saw Dalziel galloping after cattle.

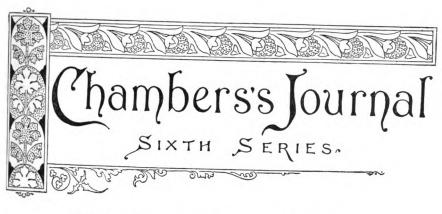

Mrs M'Coll peeped smilingly in. 'Oh, you are awake. Won't you come down and have tea with Mr Dalziel and me? He says that you haven't had a meal with him since you have been here.'

Jean nodded assent, then proceeded to comb out her wealth of red hair, and to braid it into the fine coronet that he approved. She put on a white dress. There was a soft flush in her cheeks, and, with gray eyes shining, she was no longer plain.

Mrs M'Coll's baby sitting on the doorstep gurgled a welcome as she came downstairs. Jean took him in her arms. He was a fat, pink-and-white baby,

with hair as red as her own.

Dalziel, riding down the trail, saw them standing framed in his doorway. He slipped from the saddle in an instant, and in that instant she saw his face, and before he had taken her hands or word had been said both knew that Dame Fortune had opened for them her treasure-chest, and from it had bestowed her choicest gift.

THE HEART OF THINGS.

By HENRY LEACH.

LONDON, March 23rd. happens constantly at the first advent of the sunshine of spring and the signs of the approach of another London season, when the life of the town begins to open itself

out to luxury again, that there are tertain demonstrations of the wealth of the Metropolis and the great increase thereof. The latest we hear is that there are over two thousand miles of streets in London, and that its rateable value is over forty-three millions sterling! And it is always increasing, fast increasing; there is nothing like London for that. But it must surely be increasing in the bulk rather than in all its parts, and there can be no greater error than to think that all land and property in all parts of the Metropolis is more valuable each year. The truth is that in some respects London is getting too big, and is certainly being overbuilt in the suburbs. The middle classes who Work in it have developed a passion for the country, and little Londons are being made very far out, particularly to the north, where they extend beyond St Albans. The result is that in the close suburbs there are rows and rows of untenanted houses, giving the appearance of deserted and decaying heighbourhoods, where rents are tumbling down and values thus decreasing. Those who know to their cost will tell you that there is no such uncertain investment now as that of suburban house property. But in the heart of the town it is, of course, not the same. There seems to be a magic in the increase of values there. It is said that Cornhill is the highest-rented spot on earth, and a year or lwo since a single room was let in this quarter for between two thousand pounds and three thousand jounds a year. There is a very small shop and asement in Bond Street which lets for a thousand a year, and the rest of the house in proportion. Some of the houses in Park Lane have been rented at ten thousand pounds a year, and one in Hamilton Place was recently offered for sale at forty thousand Pounds. The County Council paid thirty-four

pounds a square foot, or at the rate of over a million and a quarter an acre, for a piece of ground at the corner of St James's Street and Piccadilly. The Lord Mayor says that the lowest calculation of the rental-value of the Mansion House is fifty thousand pounds a year, and over a million pounds has been refused for the church in Austin Friars. So valuable is London! Well may visitors be satisfied simply to stroll along the streets and wonder. And as one of the charms of London is its contrast, let it be mentioned that till just lately there were sixteen houses in the Limehouse district the tenants of which had paid no rent for years as nobody knew the owners. The houses are now being pulled down, the owners being still unknown.

And with one's mind led thus towards finance, there comes up the natural question at this time of the year as to the Budget and its possibilities. It goes without saying that the process of Budgetmaking is a vastly complicated and tedious one, and for weeks past the servants of the Exchequer department have been grappling with the problems of deduction and construction which it involves. The popular impression that the Chancellor has some clear idea as to what he is going to do and say long before he does and says it is quite wrong. It is not until almost the last day that he comes by his own secrets, and even then he runs the risk of his plans being revised by the Cabinet at its final meeting before Budget-day. But there is this much to be said just now, that the impression is gaining ground that there is no justification for optimism in regard to the Budgets of the near future; and it was stated on exceedingly good authority lately that the people who are looking forward to something remarkable from the Chancellor of the Exchequer this year are doomed to disappointment. The truth is that the problems of national finance in these days are not amenable to any treatment that has for its object the pleasing of the people; there are such stern and unpleasant necessities as do not look likely MARCH 30, 1907. [All Rights Reserved.]

ever to cease again. We must pay for the complications of our civilisation; and, whatever may be the qualities of the Chancellor for the time being, he must not be called upon for feats of wizardry. One is inclined to doubt whether in our time the same popular success will ever again be achieved by a Chancellor as was by Chancellors the living image of whom still remains on our memory, and so the office becomes constantly the less thankful and the less leading towards distinction. Shortly before the death of the Earl of Beaconsfield, John Bright called on him, and in bidding his visitor good-bye his lordship, adorned with a wonderful dressinggown, accompanied him to the top of the stairs, and said, 'Well, Mr Bright, I am glad to remember that I have been Prime Minister and Chancellor of the Exchequer,' and it is remarked that he lingered as if affectionately on the last phrase and suggested that in his estimation it was the greater office. Great it is; but one wonders whether any Chancellor since Harcourt has found much to love in it, or has had many kind memories of it afterwards.

* * *

Scarcely a week passes but we hear of some sensational feat in medicine or surgery being performed by the doctors of the United States; but how is it that the moneyed American, when he feels the necessity of some very good advice or treatment, packs up his traps and departs for a season to London or Paris? Not that they all do so invariably, for the American doctor is well supported, and he has as little cause as any other to complain of any paucity in the pecuniary reward for his skill. What might in America be called famous 'scoops' have been accomplished by the medical and surgical men there. A lady of the eminent American family of Armour had something the matter with a hip, and the American doctor was given five thousand pounds and his expenses for treating it. Senator Magee died, and Dr Browning of Philadelphia thereupon sent in a little bill to his executors for thirty-eight thousand pounds as the price of his efforts to prevent or delay this lamentable affair. That the dignity of American dentistry should be maintained a fee of two hundred pounds was demanded of Prince Louis of Battenberg when the British fleet was in American waters some little time ago and something was the matter with the Rear-Admiral's teeth. Yet, with all their wonderful operations and fine fees, you cannot persuade a large and influential portion of the American public that anything else is quite as good as the London or Parisian doctor, but particularly the London man with all his vast dignity and the awe-inspiring General Medical Council at his back; which Council, sitting in its mighty conclave in Oxford Street, will banish a young doctor to the outer darkness for ever for selling a box of patent pills, and, further, will excommunicate a man from Harley Street as soon as look at him if it thinks that by a hair'sbreadth he has departed from the narrow lines of

professional custom and tradition. It is the virtue of age, and the good American often comes to Europe for his medicine and his operation, just as he comes for his pictures. When he has millions that he cannot spend the new American pictures do not suit him, and he wants the old-fashioned but still up-to-date British doctor; and perhaps, if such a thing were possible, he would like our lawyers also sometimes, instead of the highly dramatic men of one of whom, engaged in the cause celebre of the generation, we are told that he once fired off six shots from a revolver suddenly in court to show the jury how simple and natural it would be to shoot a man in certain circumstances which had just been described! In estimating the significance of the American patient's visit to London and Paris, you must think first of the utter impossibility of the British patient's visit to America. These matters are called to mind by the circumstance of a recent law case over a doctor's fees that took place in Paris, one of the parties being a French specialist of great eminence, and the other a rich American; and also by the statement to me the other evening by a celebrated London specialist that there is a constant procession of rich Americans from the Fifth and other Avenues to Harley Street, and that at times fees like little fortunes are almost as plentiful as refractory livers and irritable digestive apparatus. When your thoughtful American comes over in the summer-time—as he will be doing again very soon now-to 'do Yurrup,' and wants a little of the best and most expensive of everything the Old World can give him, it is as like as not that one of the things he has set his mind on is being overhauled by a great doctor. And, furthermore, I have just heard in this connection a rather remarkable story of a pretty piece of surgery that is in the making at the present time; that is to say, the parties have been slowly leading up to it for the best part of a year, and we are now approaching the grand climax. There is a certain specialist in London who is greatly skilled in his operations on such features as the nose—from what I could gather, they are more in the nature of external than internal operations—and there is a certain American millionaire who is troubled by some outward affection or disfigurement of his nose which he is very anxious to have remedied. While I know the name of this American millionaire, it is perhaps best not to indicate his identity further than in saying that he is quite one of the most celebrated financial magnates in the world, and that no man in compiling a list of three such would ever think of leaving him out. This multi-millionaire came to the conclusion some time since that the man to put his nose to rights was this London specialist, and accordingly negotiations of a kind were opened with him. The millionaire professed that his time was valuable, and that he could not afford enough of it to go to London. On the other hand, the specialist, who is of a distinctly independent turn of mind, declared that on no terms could he be bothered to go to America. Eventually the millionaire agreed that he would come here when he would be made humanly certain beforehand that he would be coming for a cure. In order so to satisfy himself, it was determined that two other nren with similar affections should be found out for him in America, and that each in turn should be sent over here for treatment by our great man, which was accordingly done; and there are two comparatively humble Americans who are now rejoicing exceedingly, and are somewhat doubtful as to whom their gratitude is chiefly due—the millionaire or the specialist. So the way is now clear for the visit of the magnate, and my information is that one of the ships that will be coming across the Atlantic very soon will be bringing him. It will probably be announced that he has some dark financial whemes in operation, or that he is here merely for a little rest or curio-hunting. The British doctor does not advertise, and he takes care that, so far as he can possibly prevent it, the public knows nothing of these things.

There is a new alarum in the world of books and hierature almost every week in these days. The booming of the cannon in the great 'war' having become less frequent, and the enemies having exhausted their power of attraction for the public, something else must needs be done by some publithers, to be labelled with much distinction as a 'new move' submitted grandiloquently to the public notice. One week it is one thing, and another it is something else, and generally the idea to show the public that the price of books is cally coming down, and to encourage the hope that a the present generation they may be bought by the pound or the yard just like any other commercial product, with no sort of nonsensical sentiment about the business or any gibberish about the er of the author. What is the use of talking about art and ideals and inspiration and all that and of thing when it is being announced broadcat that certain novels 'of exactly the same length and quality as six-shilling novels' are to be on sale or half-a-crown? Evidently, then, the length and the quality of the six-shilling novel is determined eactly by a definite standard, and it would be a lelight to see the machine, which is surely Amerion and worked by either electricity or petrol, viich measures the book and decides whether it conforms to the standard of quality. Since the sixshilling quality is such a definite thing, and there is allowance whatever for the variance of opinon, the evident that a machine of some kind must be You throw in a couple of hundred or so of ter novels, and they must come out at the other ad with their cash value stamped upon them. How the 'six-shilling length and quality' principle 70th out in the case of the grandest English and that are now to be bought for sixpence each, or is cloth at a shilling, one hardly knows. The fearful and wonderful historical novel of the young miss new from school is of 'six-shilling length and quality;' but what of the master's work? All this is very irritating; and as a really great writer, a lover and a maker of literature, said to me the other day, it is hard for a man to cling fast to his idealism when he has to spend half his time wrangling about percentages, means of advertisement, and so forth. Ideals, sentiment, truth, puritythey are all stuffed away impatiently in the cupboard like the skeletons which only remind us regretfully of a past and of a present and probable future that might have been so much better. It has been said for many years that authors are bad business-men; but it must soon cease to be said, for the exigencies of the situation are bringing forth a new kind of author, who has a City-made head. And ask any publisher with whom he prefers to negotiate in these days-the businesslike author who reckons the words he writes by the pint or the pound, or the genius-and he will very soon tell you that he is most attached to the former. Such are the facts of the case, and such the influences at work, that the business-like author sells his books in scores of thousands while the crystallisations of genius are hesitating in the middle of a first edition.

Influences at work? you ask, and say that surely the reading public is the arbiter and decides at all events whether a novel shall be merely a success, as 'push' and fine reviews might make it, or a great success. Let us in answer give a concrete case of the influences as exerted by the business-like author: and the facts are known to be true. There is an author whose merit need not be discussed. No doubt the works are good of their kind. That by their own unaided recommendation they would ever get through more than two or three editions each, one may be permitted to doubt most gravely. But they run to many, many editions, and he makes some thousands of pounds in a year. Nobody would suspect this; you, reader, might even be disposed to class him as a decidedly second-rate author of no pronounced popularity. But his publishers know better, and they would not part with him for a cartload of geniuses. He knows how to make a book 'go.' This author-not the publisher, but the author-has his own commercial traveller constantly touring the country and dropping into the bookshops on his behalf. He enters these shops not as a traveller but a private gentleman and customer, and he makes great friends with the man in charge. Then he happens to mention the novel that is to be pushed, strongly recommends it, and insists that the assistant must read it himself. Eventually he generally makes him a present of a copy; the bookseller reads it; he is predisposed in its favour, likes it, and recommends it to the customers. That is it: he recommends it to the customers; and if the truth were known as to how much the sale of books depended on booksellers' recommendations some surprise would be caused. The publisher is hardly in the position to do such work as this; but the clever author of the City strain can do it to perfection, and in the case that has just been mentioned it is carried on in the most extensive scale. This is surely a better system than that by which the American author breaks the windows of the bookshop which contains a large display of his new book, declaring to the assembled crowd that the work is a pollution of print and ought to be suppressed, and that it is a glory to go to jail in such a cause. Here indeed is the literary machine. And this is the generation that turns up its nose at Trollope because he confessed that he wrote to the clock, so many words per hour. I had a close friend-dead now, poor man !-- who was the editor of a very popular weekly paper, and he knew how to deal with the public in the matter of serial fiction. He invented the beginning of a plotonly the beginning of it; then he advertised it most expensively, and got an author to put his ideas in words-a sensation in every chapter. Like the little brook, the story went on and on for months and months, and seemed to come no nearer to an end. In one sense the readers 'got no forrader,' but every week they had a new sensation, and they liked it. While they did so, and the circulation kept up, the story continued. As soon as there were indications, as revealed by the publishing department, that the public was getting tired, the story closed with a snap, and to the sound of trumpets and drums another one began. He told me some of his secrets. Once a week, he said, he had a committee meeting with the author and his wife, and they discussed the next chapter and what they would do with it; and the essence of their methods was that none of them should have the faintest idea of the development of the story beyond that next chapter, or the end of it; but that as soon as an end was wanted they supplied one in the most suitable form. That man established a system, and more money was made by these committee-made serials than was ever yielded to the simple, artistic methods of a genius.

That the Lord Mayor of London, the successor of Whittington, of Gresham, and of other commercial and civic personages of historic note, is a great and wonderful man is a thing known to the world, and that vast and curious traditions surround his office is very well appreciated; yet only the man who has held office at the Mansion House has any opportunity of realising the full depth of these traditions or the full extent and scope of his truly magnificent appointment. Even Lord Mayors have come to the Mansion House, and at the end of their term have relapsed again into the plain state of alderman in ignorance of some of the dignities that have been theirs for the time being, and have through oversight neglected to exercise some odd

privileges that they will never have the opportunity again of exercising. To a Lord Mayor of an enterprising and inquiring turn of mind there is a rich field open for the investigation of his powers and his abilities. London is happy in these days in a Lord Mayor who in many most important respects approaches very near to the ideal; and it is evident that Sir William Treloar in his odd moments has been dipping into the archives of the City and finding out something new about himself and his office. He made a discovery the other day which he did not noise abroad, and which was not printed in the public press, to the effect that in addition to being more than a hundred other things, and having more than a thousand powers, he was nothing less than 'Admiral of the Port of London,' and, as such, a person of very considerable maritime importance, with much responsibility devolving upon him. Forthwith he called a meeting at the Mansion House of a body of which Londoners in general perhaps know no more than they do of the functions of their own particular Admiral-that is to say, of the Local London Marine Board, the members of which duly discussed with him certain matters of importance, and were entertained to luncheon. Few people probably are aware that the Lord Mayor has jurisdiction of a kind far beyond the confines of the City, and that in fact he has, nominally at all events, the uncontrolled conservancy of the Thames and the waters of the Medway the whole way from Oxford in the west to Rochester in the east, and that in this matter it is his privilege to summon courts at any time and place. In times which are not so very far back that there are no people left to remember them, such courts were held in the gorgeous state barge. It is his duty in this connection to visit Oxford once in fourteen years-that is, one Lord Mayor in fourteen should do so-and to go to Rochester once in seven; and such are the traditions that have to be observed on these occasions that according to general understanding the visits cost a matter of a thousand pounds each. And by way of a regular annual display of possession of the Thames, it is the business of the Lord Mayor and Corporation to go up it as far as Twickenham once in the summer-time. How many people are acquainted with the scores of other such interesting details of the Lord Mayor's office? Do they know that unless the Lord Mayor gives the permission even the King's soldiers cannot march in any considerable numbers through the streets of the City, and that-such is the deference accorded to the Chief Magistrate—he has the ineffable privilege of driving straight into the Ambassadors' Court at St James's Palace, while other most exalted personages are requested to drive round by Constitution Hill? Strangest of all, perhaps, the secret password of the Tower of London, bearing the King's signature, has to be sent to him periodically! The Lord Mayor and the City would not willingly part with any of these official reminders of the romance and the tradition of the one square mile.

A N OPEN DOOR.

CHAPTER XIII. - DIFFERENT OPINIONS.

HE newspapers containing details of the Satong trial were read by mothers sitting in quiet English drawingrooms; and many, as they read, laid down the paper and thought, 'My son-what of him?' Some could,

indeed, say with thankfulness that they could trust their sons to be the same at home or abroad; but many parents' hearts grew very heavy as they thought of those whom they so sheltered in their infancy, but who now seemed to be 'set in the midst of so many and great dangers.'

Newspapers of every kind-the Times, the World, the Guardian-all wrote in their own way on the subject of the Far East and its European inhabitants. The Englishman in the East, his life and temptations, became the subject of endless letters. Some correspondents hoped that the Satong tragedy would arouse the English to take a deeper interest in their countrymen who did not live under the British flag. They said that England would never really deserve the name of Greater Britain till she cared for those countrymen who pushed her trade and furthered her supremacy by living under a foreign flag. Some correspondents gave gloomy accounts of life in the Far East: its want of large interests and the demoralising effect on the average Englishman of living with the Yellow Races; but others took quite a different line. They declared that young men met with temptations everywhere, and that it was absurd to think that the Far East was one bit worse than any other part of the world. lt was, however, generally conceded that though there may be temptations everywhere, they come with greater force in the Far East, where friends and interests are comparatively few, and where women as well as men give way under the deteriorating effects of a hot climate. All the writers agreed that had Gerald Denistoun remained in England it was, humanly speaking, quite certain that he would never have become a murderer; but it had been his misfortune to be placed where every good influence was withdrawn from his daily life.

Every good influence!' When Sidney read the worls they seemed to stab him like a knife. Why had he not stayed and become the good influence of hat boy? He remembered so well the night of the picnic, and the fair, blue-eyed youth who had been Pinted out to him. A murderer! Sidney could picture to himself only too well the steps by which he had gone down the road to ruin.

Every good influence withdrawn.' It seemed as if the murder lay at his very own door, for he had been called to that place, and he might have been the restraining influence which would have kept the young man to better things. It was his fault that a man of no power was the representative of

Christ's Church in Satong. He stood condemned at his own judgment-bar, for he had turned his back on the place in search of more congenial surroundings, and it seemed to him that life could never again contain for him any gladness.

The only very clear idea in his mind during those days was that he must tell his wife everything, and, if possible, enlist her sympathy in an effort to enter on some entirely new line of life. For he was filled with a kind of hatred of the life he was leading. The devoted followers, the fashionable church, the exquisite music: what had all these things to do with one who professed to be a follower of the Man of Sorrows? True, he had worked hard in the cause of the poor, but his labours only served to bring him all the more prominently before an admiring public, who appealed to him as an authority on all kinds of charitable questions. He had deliberately chosen his path in life, and it had certainly brought him to great success; but had it brought him equal happiness? He could not feel that it had.

The Sidneys had no children, or their home-life might have counted for more; and, though looked upon as an attached couple, both Sidney and his wife were conscious in their secret hearts that married life was not what they had expected to make it. That intimate friendship which constitutes its finest and rarest part seemed rendered impossible by the multiplicity of their social duties and friends. Sidney had never dared to analyse his feelings on the matter; but now that his heart was filled with bitter thoughts, he realised that he and his wife had floated far apart, and that it would require a great effort on his part to bring them close together again, for there is no greater blow to a high-minded woman than to find that one she loves has failed to act up to her ideal. A woman's mind easily forms an ideal, but if it is shattered a man must have something really noble in him if he is to raise the structure again. Sidney knew this well, and he felt that the task was one in which he might fail. Would she be pitiful and forgive?

CHAPTER XIV .- WESTMINSTER ABBEY.

N consequence of Sidney's increasing reputation as a preacher he had been asked to preach in Westminster Abbey. It happened that during the couple of weeks when the

Satong murder had been so much discussed his wife was away visiting relations, and so he was spared having to answer her questions on the subject. He now resolved that after his sermon in the Abbey he would go away for a couple of days to some country place, where, free from interruptions,

he could tell her of his failure to pursue the highest path, even when he had seen it lying clear before him.

The first sermon in the Abbey must always be an event of some importance in a man's life. The illustrious dead are so near that it seems as if the voice must reach them; and wherever the preacher looks there are the visible signs of a mighty past mixed with the living, thinking multitude whom it is his duty to impress. The great Abbey was crowded; the boys' voices rang melodiously; the organ gave out wonderful notes that sounded like the deep boom of breaking waves.

Sidney looked up to the traced roof, where the sunbeams were showing up the dust of centuries, when suddenly it seemed to him as if his surroundings faded away, and he saw instead the little whitewashed church at Satong, where the punkahs were flapping feebly, while a handful of people struggled through a hymn to the accompaniment

of a squeaky harmonium.

'The luxury and the poverty of spiritual things! There is where I was really needed, but I chose my part with the luxurious,' was the thought in the speaker's mind as he followed the verger through the standing crowd up to the pulpit. He announced as the subject of his sermon the young man of great riches who came to our Lord, but went away sorrowful. 'He had great possessions, and when called upon by our Lord to renounce them he could not make up his mind to the sacrifice. Was he, then, a lover of money—a miser? No; emphatically no. We can be certain that our Lord did not love a man who was a miser or who spent his wealth in selfish indulgence. This young man "loved God and loved his neighbour," and could look up into the face of the Divine Man, from where he knelt at His feet, with such a look of truth and simplicity that he was at once admitted into the little company of men and women of whom it is said that Jesus "loved" them. We may believe that he was a forerunner of the modern philanthropist, who delights in having the command of large sums as a means of benefiting his fellowcreatures, and Christ asked him to strip himself of this power and become the penniless follower of an itinerant preacher. He asked the young man, in fact, to resign the guidance of his life into His But at this point the young man's faith failed him, for he loved the exercise of his great powers, and so he went away sorrowful. And we may venture to think that it was a sorrow that never left him. All through life, even in the midst of honourable ease and surrounded by friends, he would hear the Voice that had once said to him, "Follow Me," and no doubt he knew that in refusing that call he had turned from the path that led to his highest spiritual development. And it is the same with the Christians of to-day. They have faith and accompanying good works; they strive to obey the commandments of God, and to love their neighbours; but when it comes to the surrendering of their lives into the hand

of God they draw back. They wish to retain the guidance of their lives. They are like men who, having called a pilot on board, refuse to let him control the ship. We look round a church full of Christians, and what anxious, careworn faces we see! They are all agonising over the guidance of their lives. But some one will perhaps say, "God no longer gives us direct guidance; no pillar of fire goes before us; no angel visitant points out the way; no voice of Christ falls on our ears." Yet to the heart that is looking for it, the guidance comes often in ways that we cannot make clear to others, but it is recognised by the heart; and if we have the strength to yield ourselves to it we enter a haven of deep peace. If we refuse it, like the rich young man, we may live good and useful lives, but there will always be in the background a sense of something missed.'

When the preacher went on to describe the unquiet of the man who has deliberately taken a lower sphere than that to which he was called, the interest of the congregation was riveted. He spoke with the power that comes from personal experience of what is described, for he realised now that the restless energy of his life, with its unsatisfied longings, rose from the consciousness of a call received and refused.

As he left the cloisters after the service a hand was laid on his shoulder, and, looking round, he saw a well-known Cabinet Minister.

'I hope that you will come round and have lunch with me,' he said. 'It would be a pleasure to us to make your acquaintance.'

Sidney excused himself on the plea that his wife had not been able to come with him, and was awaiting him; and he hurried home, filled with a great desire to see her and talk over the past.

CHAPTER XV .- A VISITOR.

HE servant who opened the door informed Sidney that there was a visitor in the drawing room.

As he entered, his wife stood up, and saying, 'Here is a visitor for you, Arthur,' she quickly left the room, but not before he had become conscious that something had happened.

Looking from his wife to the visitor, he saw Mr Scott from Satong.

'How are you, Sidney, my dear fellow? I have come straight from the Abbey. Saw your name down in the papers as preaching, and thought that I really must go to hear you. By Gad, that's something like a congregation! Rather different from our sleepy little set at Satong, eh? I was just telling your wife how hard we tried to get you to stay out there. She seemed to have got some queer notion that we had not wanted you to stay; but I told her that she was never more mistaken in her life. Of course we wanted you; but you were quite right, Sidney, not to listen to us—quite right; and I don't know how we were such fools as to imagine for a

moment that a man of your ability would remain at Satong. Why, I hear that you are spoken of as one of the rising clergy of the day. You will be a bishop soon, and live in a palace

Before Mr Scott had finished speaking Sidney perfectly understood the meaning of his wife's abruptness, and he felt sure that at that moment the was bitterly accusing him in her heart. She had heard from a stranger what he had meant to tell her himself, and she knew now that he had allowed her to labour under a delusion with regard to the way in which he had left Satong. To some women the whole thing would have seemed a mere nothing; but to Ethel Sidney the discovery that her husband had failed to respond to a call was a real blow.

Sidney longed to go to his wife, but it was clearly his duty to ask Mr Scott to stay to lunch. His wife sent a message that she had a headache and would not appear.

Sidney never forgot that meal; it seemed to him to last for hours, though it was really but a matter of minutes. Fortunately, a few questions were enough to draw forth a flow of conversation from Mr Scott.

Yes, we came home very unexpectedly. My wife would not hear of poor Lady Denistoun going home alone, and the firm had some business to do in England, so we managed to get away. It was a sad voyage. Poor Lady Denistoun! she felt the arrival at home terribly. The eldest son threw up his commission in the army, he was so crushed by this sad affair. He decided to go to Canada, and his mother insists that they shall all go with him. The best thing they can do, I think, for the old General may pick up a bit in new surroundings. Lady Denistoun is quite broken down now-much more so than at first. She does not brood over the actual murder so much as the fact that the poor toung fellow had been going wrong for some years. She thinks that all this might have been prevented, and she does not say much, but she blames us all, in a way, and she openly blames old North. But what could he have done? He had no kind of influence with the young men. If it had been you, how, it would have been different. We have often regretted your leaving; and upon my word, Sidney, you could not have looked worse there than you do hor, for you look about as ghastly as I ever saw a

A lew hours afterwards two doctors were bending orer Sidney and shaking their heads while they talked of brain-fever and the different methods of varying it off.

There were many days when Sidney hovered between life and death; but as he slowly recovered be felt that the illness had been a veiled mercy.

Long before the doctors had given him leave to talk, he had begged his wife to bend down so that temonstrances he slowly told her the history of that decision at Satong, and how the remembrance of his

weakness then had clouded the brightness of his spiritual life ever since. Had he been well and active and going about his usual work it would have been impossible for him to have had so much uninterrupted conversation with his wife; but laid on a bed of sickness, with long hours when no one else was by, little by little he got back to that heart-intimacy which had belonged to the early days of their love for each other.

Ethel took a woman's practical view of the matter, and would not let Arthur blame himself for the Satong murder—that she would not allow to be in any way laid at his door; but he could see how very hard she found it to get over the fact that, while she had been longing to go to work in a heathen country, he had refused a call to do so, and had hidden the matter from her.

It seemed to Arthur that she could never again have the same confidence in him. One day before he was yet able to be out he was told how his name was being mentioned in connection with the appointment to an important living. It was a post of great distinction, where he would have ample scope for his powers; but the prospect gave him no pleasure, and the thought of life in a palatial house was very oppressive.

In turning over the sheets of the paper that mentioned his name his eye fell on a letter dated from a town in Western Australia. It stated that a few years before this town had been a mining-camp, but that circumstances had led to its rapid development, and that now the better class of the inhabitants were desirous of building a suitable church, if only they could get a clergyman to go out to them. The stipend offered was small, but they pledged themselves to try to increase it, and to give every help in their power. The name of their representative in London was given.

'Ethel,' said Sidney, 'if I were to resign my present living, do you suppose that there would be any difficulty in filling my place?'

'Why, no,' said his wife. 'I imagine that there are a number of men who would gladly take it. But why do you ask?'

'Because,' said Sidney, 'I have heard of a place where there are people wanting to be led aright, and there is no one to lead them—a place to which I expect no one will be willing to go. Shall we make inquiries about it?'

A week later the papers announced that the well-known Reverend Arthur Sidney had accepted the chaplaincy of a mining township in Western Australia. What were the bishops about to let such an able man leave the country? cried the press. And the bishops did their best to prevent it by letters of expostulation and offers of many kinds of work.

You are quite sure that you do not regret your decision?' asked Ethel.

'With that in front of me?' he said reproachfully, pointing to the grateful letter accepting his offer of service and telling of the fruitless search which had been carried on for more than a year.

'And this,' handing her the letter from the patron of his present living, a letter which mentioned that his successor had already been fixed on.

CHAPTER XVI.-IN AFTER-YEARS.

T was some years after this that a large public funeral passed through the streets of a town in Western Australia. There was an expression of sorrow even on rough faces, and the name of Arthur Sidney was on every lip.

On the evening of the same day a brotherclergyman entered the room where Mrs Sidney

was seated.

'I hardly like to intrude,' he said, 'but I wished to tell you of the meeting held this afternoon. The way in which some of the miners spoke of your husband, and the feeling shown all through, was quite remarkable. He gave up a career and fame in England to come here when this place was not much more than a lot of shanties; it is now a prosperous town, but all that is of good in it is owing to him. The amount of money for the memorial that has flowed in is wonderful; with it they can build splendid memorial schools. The men also

chose a beautiful design for the grave, and a

...

. F. ' 18

Mrs Sidney leant back and closed her eyes. A long-past scene rose before her: the deep grass of a Devonshire field, blue sky and red cliffs, the sweetscented wind, and in her ears the voice of her husband: 'Put on my grave the words, "An Unprofitable Servant." How vividly it all came back to her mind! There was a silence for a few minutes, and then she looked up.

'I can't tell you,' she said, 'what a help the miners' sympathy is to me. The happiest years of our married life were spent here, and never for one moment did my husband regret his decision to come out. It is very sweet of them to respond so warmly about the memorial; but I must mention one thing. Many years ago my husband almost made me promise that on his grave should be put merely the words, "An Unprofitable Servant."

'Just like Mr Sidney's humility, and if you were choosing the monument you might feel bound to respect that wish; but, as you have put it into the hands of the men, don't you think you must leave

the choice of the text to them too? They have already decided that at the foot of the cross are to be the words, "Thou Good and Faithful Servant,"

THE END.

SCIENCE AND ARTS. THE MONTH:

VIVISECTION.

HE Royal Commission on Vivisection has issued an interim report containing the results of the examination of seven witnesses. The evidence of Mr E. H. Starling, Professor of Physiology at University College, is

of a striking character, and may be commended to the careful attention of both sides in the controversy which rages round the question of vivisection. Pointing out that under the present law experiments on animals were never performed by students for the purpose of acquiring knowledge, and that even surgeons were forbidden to perform operations on animals with the object of attaining skill, he says: 'The student's first administration of an anæsthetic or his first tracheotomy is, therefore, performed on the human patient.' It would almost seem that the framers of the present law had thought less of human life than of that of the lower animals. In Professor Starling's opinion, 'a new operation, or one which is new to a surgeon, should most certainly be tried by him-under anæsthetics and with the same aseptic precautions as would be used on man-on the lower animals.' He goes on to say: 'I think the present regulation of the law which expressly forbids surgeons to acquire skill by experiment in operating on animals is most immoral. A man must acquire skill somehow, and it means

his acquiring skill by experimenting on his human patients. The effect of that will be evident if you took half-a-dozen surgeons and compared the deathrate of their intestinal resections in the first ten cases and in their second ten cases. You would see what that means in human life.'

ANOTHER NEW FILAMENT.

The light obtained from the incandescence of a thread of refractory material under the stress of an electric current is probably the most all-round satisfactory form of artificial illumination we have. That this is so may be gathered from its very widespread use in spite of the fact that it is perhaps the most expensive of all the common artificial illuminants. But constant effort is being made to reduce the cost of producing light by this means, and every new invention is a step in the right direction. Of late some of the rarer metals have been called into requisition to replace the carbon filament in the familiar glow-lamp; but these have certain disadvantages, such as the great length of wire necessary, undue delicacy, or high initial expense, which militate against their complete success. Now there is news of a promising new filament which has been given the name of 'Helion,' because the pure white light it gives has a spectrum like daylight. The new filament is the invention of Professor H. C. Parker and Mr Walter G. Clark, of Columbia University, who have been working on it for seven

years. It is said to be composed chiefly of silicon reduced and deposited upon a very thin basic filament of carbon similar to that used in the ordinary glow-lamp. It is not of undue length, and it is sealed in an ordinary glass bulb exhausted of air in the usual way. It yields an intense white light at a comparatively low temperature, the consumption of electric energy being one watt to the candlepower. When it is remembered that the consumption of the ordinary carbon-filament lamp is from three and a half to four and a half watts per candlepower, it will be seen that a very notable economy is here foreshadowed. The experiments so far made appear to indicate a long life for the lamps, which compare well in this respect with the glow-lamp of commerce, and the drop in candle-power towards the end of the experiments was small. It is to be hoped that if these early reports be substantiated the new lamps may soon be obtainable commercially, and that the price will be sufficiently low to ensure them a fair trial.

TRANSPARENT TILES.

Interlocking tiles for roofing purposes have taken the place of slates in a great many modern buildings, for they have a much longer life and are quite as cheap. Hitherto they have only been made in red, but now, according to the Scientific American, they are being made in green, buff, brown, and other colours, an innovation which will no doubt be followed in this country, where it will be much appreciated by architects. Glass tiles have also recently been introduced. They are made uniform with the clay tiles, and may be used in a roof in any desired number and wherever it may be wished to give light to the place beneath. Skylights are always more or less unsatisfactory, for the best of them leak in time, and the worst of them behave in an altogether abominable manner which only those who live in houses fitted with them can fully ap-Preciate. But to transparent tiles, inserted with the others wherever required, no such objections can be urged. For factories, studios, and other similar structures they should prove a great boon.

MORE FLYING-MACHINES.

In a recent article in the English Mechanic a few Particulars are given of a flying-machine which is leing constructed upon a new principle by Mr Thomas Coop, a Lancastrian engineer. The flyingmachine, which is of the 'heavier-than-air' type, is designed to rise by the direct lift of several propellers, and is not dependent upon the inclined plane which forms the basis of most machines of this type. It is believed that by avoiding the use of the inclined plane the danger so often met with, caused by sudden puffs of wind as the machine ises will be obviated. The new machine has alto-Sther eight flights of wings, the principal ones being in the centre at the top; while there are pro-Pellers fore and aft, side-propellers to check the action of cross-winds, and one at the bottom to help

in regulating the descent. It is stated that much ingenuity has been devoted to the combining of extreme lightness with strength in the construction of the machine, which has a framework of bamboo. It is intended to carry three persons and two twentyhorse-power petrol motors. It will readily be understood that a very high degree of efficiency will have to be attained if the machine is to rise with this load under the influence of its wings alone. Another new machine known as the 'Cornu helicopter' is in course of construction in France, where a series of trials has been made successfully with a small model. In this machine, which is also of the 'heavier-than-air' type, the ascensional power is provided by screws, but light canvas planes are used to assist in the flight. In the trials with the model apparatus, the machine, which carries a twohorse-power gasolene motor, rose readily in the air, the propellers having to lift a total weight of over thirty pounds. Monsieur Cornu, the inventor, proposes to build a larger machine on the same lines, and to enter with it for some of the aeronautic prizes which have been offered by different people.

A BALLOONIST'S RECORDS.

It may be true—it probably is—that the 'heavierthan-air' type of aerial machine will very soon oust for ever all the air-ships which depend upon displacement for their ascensional force, and that balloons of every shape and form, from globes to cigars, will remain only as curiosities of the earliest experimental days. Even so, a record of the experiences of balloonists must have an interest of its own, and a little booklet, Five Thousand Miles in a Balloon (Horace Cox), which has been compiled recently by Mr R. Hedges Butler may be commended to the attention of all who are interested in the subject. If Mr Butler were not already known, his book would reveal him at once as an absolute enthusiast, and in that respect he is closely resembled by his friends whose contributions are also included in the volume. Enthusiasm is proverbially catching, and it is impossible to read the records of these aeronauts' adventures without a longing to participate in the joys they describe so rosily. The book is of a rather heterogeneous character. It includes an account of the inauguration of the Aero Club of Great Britain; a description and diagram of a balloon, with the names and uses of the various accessories; a 'Log' of The Dolce far Niente, the author's balloon; some photographs taken from a moderate height, and many other things; and Mr Hedges Butler's own connection with all these matters is clearly indicated. One is prone to envy the author and his friends their keen enjoyment of a pastime which is most aptly described in the name which he has chosen for his own balloon.

A NEW TRAMWAY BRAKE.

Despite the lively competition of the motoromnibuses, electric tramway systems are continually being opened up, and the question of effective

brakes for the heavy vehicles is one of ever-increasing importance. Indeed, the alarming increase in speed which vehicles of all kinds are exhibiting at the present time makes effective braking a burning question of the day, whether in connection with pleasure motor-cars or express trains. But it is most important of all in a vehicle intended to be run on public roads and yet incapable of dodging any sudden obstruction. The only alternative to collision being to stop, the ability to stop quickly is very necessary. Of course, the limit of efficiency of any braking device acting upon a wheel is reached when that wheel is stopped by the brake and begins to skid. In certain states of the weatherall too common in this country—that limit is quickly reached, and the tram-car slides on to destruction, for it is beyond the power of any man to stop it. The many lamentable accidents which have occurred from this cause have led to the invention of a brake which acts directly on the tram-rails independently of the wheels. The invention, which is credited to Mr Edwin Freund, is simple in its construction and its application. The brake-blocks are pressed upon the rails by very powerful spiral springs, but are normally held away by counteracting springs drawn into place by the windinggear on the driver's platform. A simple movement on the driver's part releases the winding-gear and applies the brake. The greatest nicety of adjustment of the braking force is quite easily obtained, and the mechanism is so arranged that the failure of any part is more likely to put the brake on than to release it at a critical moment. As this new brake is obviously independent of, and may be used supplementary to, any existing brakes acting upon the wheels, it is likely to come into considerable favour. It is reported that the working of the device as attached to a car at Liversedge, where it is being tested by the Yorkshire Tramways Company, is remarkably good.

WIRELESS TELEPHONY.

Very interesting articles on the present position of wireless telephony are contributed by Mr R. A. Fessenden to both the English Electrical Review and the Scientific American. According to this writer, the telephone without wires is now in actual successful operation over a distance of more than ten miles. This is merely a beginning; for while the difficulties of the ordinary telephone increase rapidly with the distance to be spanned—as all users of 'trunk' lines know to their grievous cost-the same trouble does not appear to apply to the wireless system. Moreover, extraneous sounds are delightfully conspicuous by their absence, and no harsh noises interrupt the serenity of a wireless conversation. How far this perfect serenity will obtain when the time comes for more than two people to be talking in one continent is not yet quite clear; but the faint-hearted must take hope from the remarkable results in 'selectivity' already achieved in the field of wireless telegraphy. The effects due to the electrical capacity of a cable submerged in water make long-distance telephony across the seas practically impossible by present methods, and it is in this connection that the wireless method may find its principal use, for when there is no wire there can be no capacity effects. It is perhaps too much to hope for a telephone system with no exchange and no telephone-girls; but one may look with the eye of faith to the time when actual personal speech may be possible across the pathless ocean.

GREENWICH OBSERVATORY.

If those who had the original placing of the Royal Observatory at Greenwich could have foreseen its future, and that of London, they would probably have chosen a spot more remote from the great Metropolis. One of the first signs of the times was observed when the delicate instrument intended to record the magnetic storms in the earth, which have some sympathetic relationship with the spots on the sun, suddenly took to recording instead the movements of the South London tube railway and entirely neglected its real duties. More recently, the erection of the London County Council's electricity generating station gave promise of serious trouble, and a committee was appointed to inquire into the situation. The lately published conclusions of this committee of experts are to the effect that properly balanced turbines should be installed for the additional engines required to complete the equipment; that thereafter the present reciprocating engines should not be used at night; that the present unfinished chimneys should not be carried higher than two hundred and four feet above Ordnance datum, and that the discharged gases from them should not be hotter than at present. However, the London County Council has been 'advised'—it is not said by whom-that many of the provisions of the committee of experts are needless! They will be accepted, therefore, with some alterations. It is to be hoped that when the situation is reviewed in a couple of years' time, as provided for by the committee, it will be found that the interference with observations has been sufficiently moderated, for the value of an observatory to which the whole world looks for accuracy must not be lightly sacrificed to the exigencies of municipal trading.

A TRAIN OF MOTOR-CARS.

A motor train of an unusual pattern forms the subject of a French patent which appears to have a useful future before it. The train is designed for use upon ordinary roads, and it may comprise any reasonable number of cars. It consists of an engine-car carrying the motive-power, and as many other carriages as may be required. So far it resembles an ordinary railway train; but here the resemblance ends, for the engine does not pull the carriages, which, on the contrary, are all self-propulsive. The engine provides the motive-power, which is transmitted to

every carriage of the train by a longitudinal flexible shaft running its entire length. Each carriage has three pairs of wheels, which are so pivoted that every or follows exactly the course previously taken by the leading vehicle, which is the only one steered. Thus the driver on the front carriage may take the most erratic course necessitated by tortuous country lanes in full confidence that the rest of the train will follow him exactly even though he may have doubled on his track before the last carriage is round the corner. As the engine does not pull the carriages, there is no necessity to make it additionally heavy in order to give it adhesion to the road, so that the difficulty with most traction-engines, which are forbidden on many bridges because of their weight, is not present with this train, where the weight is more evenly distributed. The invention, which is shortly to be introduced into this country, is known as the Renard train.

THE MOTOR-CAR IN WARFARE.

In a lecture before the Royal United Service Institution, Sir J. H. A. Macdonald advanced the view that motor-cars on common roads in the near future will prove a more efficient means of concentrating troops to repel an attack than that afforded by the railways. It is self-evident that in a case of invasion by sea, one hundred men on the spot while the invading forces are practically helpless in boats rould be more valuable than a thousand later on. Sir J. H. A. Macdonald appeared to think that the motor-car would almost entirely supersede the nilway, and in enumerating the disadvantages of the latter, he certainly made out a strong case for the road-cars. But it is probable that in actual Parlare both means of transport will be taken full idvantage of. The very valuable services which a sufficient number of motor-cars could render an amy in case of sudden invasion were well enumerated and marshalled by the lecturer, whose carefully prepared paper formed a valuable contribution to our knowledge of the subject.

THE ISTHMUS OF TEHUANTEPEC ROUTE.

The Times has recorded the inauguration of the stat interoceanic waterway and transcontinental route across the Isthmus of Tehuantepec, where Hemando Cortes once led his victorious army, and There, some thirty-eight years ago, General Diaz imself was fighting for the very existence and integtity of the Republic of Mexico. This comprises a nilvay of about one hundred and ninety miles and ivo terminal ports, Salina Cruz, on the Pacific, and Cathacealcos, on the Gulf side. Vast changes have taken place here, as in most other parts of Mexico. Not only have the burning of villages, the looting of classes, and numerous executions among the habitants given place to the laying out of planthing, the erection of factories and mills, and the contraction of railways, but a complete transfornation of sentiment towards foreigners has manilested itself. The once hated gringo is now regarded

with respect, and the British are gratefully recognised as legitimate developers of the Republic's immense natural resources. The important undertaking is mainly the outcome of British enterprise and capital. With the arrival of the first vessel, the Arizonian, of the new American Hawaiian line of steamers, at the entrance of the inner harbour of Salina Cruz, the world's newest and shortest interoceanic route was inaugurated.

THE OKAPI.

The Royal Scottish Museum, Edinburgh, has been lately enriched by a fine specimen of an adult male okapi, the strange new mammal discovered by Sir Harry Johnston in Central Africa, and known to science as Ocapia Johnstoni. The same museum has probably the finest collection of birds in the United Kingdom; and the keeper, Mr W. Eagle Clarke, is having these and other natural history specimens relabelled with their common and unscientific names for the sake of the 'man in the street.' There is a specimen of the okapi in the Rothschild Museum at Tring, Herts, and in the Natural History Museum, London; but the Edinburgh example is finer than either. The okapi belongs to the giraffe family, though it has a shorter neck and legs, a different style of colouration, and has no mane on the neck. The London specimen gave one who knows the fauna of Africa the impression that it was a blending of three different mammals—the antelope, giraffe, and zebra. Mr Clarke regards it as a more primitive type than the other existing members, which it connects with a number of extinct animals whose remains are known to palæontologists. The Edinburgh specimen stands fifty-nine inches high. In colour it is chiefly of a rich purplish-brown, with the side of the face creamy-white. The hindquarters and upper part of the fore and hind legs are transversely striped with alternate bands of a fine dark chocolate-brown and white. No European until the Boyd Alexander expedition seems to have seen the okapi in its native haunts in the Ituri forest, Congo Free State; the skins brought home were procured from the pygmy natives. Major Powell-Cotton, who has sent a skin and complete skeleton of an adult male to the national collection, has also gleaned much information from the forest tribes about the okapi.

TO ABOLISH MAIL-VANS.

The Berlin postal authorities are testing a new project which promises to revolutionise the conveyance of letters and parcels. The idea is to have an underground tube with a circumference sufficiently large to permit a man to enter in a stooping attitude. These tubes are to connect the central postoffice with the principal stations and with the district offices. Two sets of rails are built in this tube or tunnel, one over the other, not side by side. The upper set of rails is supported on the sides of the tube, thus practically dividing it in two. Small carriages, running on two wheels, are automatically driven by electricity along these rails. No locomotive is used, nor is there an attendant with the carriage. As many as six of these carriages can be run together for conveying letters and parcels from the arrival station to the central post-office, and from thence to the various districts, or vice

versa. By this means letters, &c., can be delivered in any part of the city in less than a fourth of the time formerly required. So far the scheme is not out of the experimental stages, but it promises to be a success, in which case the mail-van, with all its poetry and romance, is likely to disappear from the streets.

THE PEACEMAKERS.

By Captain FRANK H. SHAW, F.R.A.S.

INGLETON, the same Cingleton who piloted the train of gun-smugglers through the forests of the Congo—but that has been told before—looked at Isabella de Cordeza. Finding himself well repaid for the

glance, he continued his observation, and smiled in a satisfied manner.

Isabella de Cordeza returned the first glance, also the second, and smiled too for the same reason. Then she spoke.

'It will kill papa,' she said.

'Hardly,' returned Cingleton. 'What's a defeat more or less in South America? They happen every day.'

The young girl leaned forward in an attitude that showed every line of her well-developed figure ravishingly. South American females develop early, and are very beautiful—or very ugly. There is no middle course, no compromise. Isabella was beautiful. From where they stood, the sharp crackle of intermittent rifle-firing could be plainly heard across the waters of the sleeping bay. An occasional yell, muffled by the intense heat and the distance, rose to a shricking crescendo, then fell to an ominous silence. Once a deep, resonant note of volley-firing boomed through the air.

'That's the end of poor Cortega,' said Cingleton. He had grown to like the smart young aide-de-camp of the President, but, being human, recognised that his removal had its advantages. However, if he had arrived earlier he would not have hesitated to attempt a rescue.

'Oh, you don't know papa,' retorted the girl, replying to his first observation. 'We Latins haven't got the easy-going temperament of you English, Mr Cingleton. I have had a chance of observing the difference during my schooldays. Papa has worked himself to a skeleton for the sake of these people here; he has given of his best, and they were happy under his government until that beast-that ladrone-Fuegos came on the scene. How would you like to see the work of your life dashed to pieces just because an impudent murderer got drunk and talked to the people about their wrongs? How would you like to have the men you had trained yourself ransacking the palace to find the man who had given them every good thing they possess, intending to put him up against a wall and shoot him? Wouldn't it break your heart?'

'Come to think of it, it might. But your father made the great mistake of trying to rule by love, whereas fear is the only god these blighters will bow down to. I know them. I've had dealings with them before, worse luck! Hit the beggars first, and then tell them you'll hit them again if they try to do things; that's the proper way to handle the brutes. Never mind whether they've done anything wrong or not; you can't go far wrong. They're probably thinking out some mischief.'

Señorita de Cordeza gave an impatient sigh.

'Stones for bread!' she said bitterly. 'I looked to you for a means to remedy the evil, and you talk trite platitudes. Heavens! if I were only a man I'd never rest until I'd made some attempt to turn them away from their plans.'

'Look here,' replied Cingleton humbly, 'I'm jolly sorry; but what can I do? I'm one man by myself. I landed from the steamer out at the Point because they wouldn't let us come into harbour; I hadn't the faintest idea that anything was wrong until I spotted your carriage and you spoke to me. Hang it all! give a man a chance, Miss Isabella.'

'I'm sorry. But, oh! you can't imagine what this means to us. It spells death for papa and desolation for me. Not that that matters much, though. I was too hasty, Mr Cingleton; but isn't there a way out?'

It was rather a difficult problem to set a maneven a man like Cingleton—that of finding a remedy for a South American revolution. The Republic of Wisteria-one moderate-sized city and a few hundred square miles of sun-baked plains-had caught the infection from a neighbouring state, and, incited thereto by the tempestuous arguments of a drunken ne'er-do-weel, had risen in might the preceding night, stormed the palace, shot down the few guards who had remained loyal, and had only just escaped murdering the late President and his charming daughter. But for the presence of mind and loyalty of an old servant, who had lured them away under pretence of visiting a case of distress, they would have fallen with the guards. It was now late afternoon, and still the sounds of tumult were coming to the listeners' ears.

'Let's talk it over with your father,' said Cingleton, striding away towards the entrance of a deep cave in the sun-baked rock. He tapped his high boot impatiently as he walked, using a silver-headed

cane for the purpose. Isabella de Cordeza smiled again as she watched his broad shoulders and the determined throw-back of his head.

'A man!' she whispered to herself. 'He's a man!

'So you want to get back to La Castries?' asked Cingleton a moment later. 'Feet first or head

The ex-President smiled without merriment.

'So far as I can see, Señor Cingleton,' he remarked, 'there will be no need for me to go to La Castries. It will come to me-angrily.'

'Yes, after it has got drunk. But how long do you reckon it will take La Castries to get comfortably intoxicated on that stuff you call wine here?'

'The Pacific steamer landed two thousand cases of brandy last week,' murmured the President, 'and it had not been taken out of the Custom-House yesterday. But it is out now.'

'Oh, brandy!' said Cingleton. 'That's a different matter. They'll have to sleep that off. I know the kind of brandy that's imported here-rot-gut suff. How long do you reckon it will take them to find you?'

'Till to-morrow perhaps,' said the President. 'To-morrow at, say, ten o'clock.'

'And then ?'

De Cordeza made an eloquent gesture, embracing both himself and his daughter. Cingleton seemed to see the pair propped up against one of those dazzling white walls that seemed designed by their constructors for summary executions. He almost heard the word of the officer who commanded the firing party: 'Make ready! Present!' No, it

'What resources have we?' asked Cingleton. The President threw out his hands. 'None,' he

labella broke in with gleaming eyes, and the Englishman fancied he saw a little elusive flicker deep down in their pupils—a flicker that made him catch his breath sharply. 'That was something worth trying for,' he said under his breath.

I thought you and your countrymen made resources, Mr Cingleton, she said with the childish confidence of a young girl. 'History tells of a hundred instances where you have overcome super-

human obstacles through your own pluck. Think!' Pedro the Scoundrel has a small steam-launch hidden away on the Point, said Juan Gomez, he who had driven the President away from death. He-it is nothing now, Excellency—he smuggles

Cingleton's eyes sparkled merrily.

Then the dilemma solves itself, he murmured. We will all embark on the smuggler's launch, and ranish from Wisteria for ever.'

He looked to see a smile of relief overspread two lace, but he was disappointed. Blank contradiction

To fly from my country!' said the President. That is undeserved, señor.

'Blest if I can see the difference of flying from the palace and flying from the country,' said Cingleton vexedly. 'Isn't it a bit like hair-splitting? You'd come back after the fireworks, and tame 'em down all right. Rest assured, the bally place won't fly away from you.'

'Now, at present it seems disposed to fly towards me, as I have before said,' rejoined the President. 'Jesting apart, Señor Cingleton, I cannot leave Wisteria. All I have is here. The few dollars that I have saved-not many-are hidden in the city. My work is here. Ah, little do you young men know what an old man's work is to him when it is done, and there is no more doing for him! No, señor, I cannot leave.

Cingleton meditated. A plan was forming itself in his resourceful mind-a bold, daring plan, that might set the greatest nations of the world at loggerheads. It was risky-too risky to be done without hope of some reward. He was not a mercenary man, either; in fact, on a cool dozen occasions he had thrown down a gauntlet to great Powers for the sheer love and lust of the thing. But now he wanted a reward. It was no question of money; no mining concessions would suit him; and yet he had come to Wisteria solely for the purpose of opening up silver-mining there. What he wanted-he had found it out a year beforewas that piece of ardent, palpitating flesh and blood that stood regarding him with a pensive smile. She had great faith in the workings of the English mind; she had been brought up in England, and even that had not disillusioned her. And now, seeing that Cingleton's head was bent in earnest thought, she awaited his decision with breathless

He looked up and caught her intent glance. Some sort of a blush crept up under the tropical tan of his good-looking face; and he turned away, half-ashamed of his thoughts. But if-

She too coloured bewitchingly, and averted her face. He turned again in time to see the crimson tide climb slowly up from the loose neck of her evening-gown-she was still in evening-dress, as she had been when she left the palace so hurriedly; he watched it reach her cheek; then her low forehead took on the glow; and a little vein in the man's temple throbbed madly. Impulsively he started forward, then recollected himself in time. The President leaned back with resignation.

Isabella leaned forward a little, until her breath stirred the thinning hair about Cingleton's brow. Her lips were so red that they seemed to owe their colour to art, but he knew better; the gleam of pearly white that was revealed between the crimson wonders intoxicated him. He clenched his hands, and the throbbing vein stood out like a piece of whipcord.

'I would give anything,' she murmured, 'to give my father back his own.'

Then Cingleton realised that he was a very cad. Like the coarsest bargainer, he was trying to sell his assistance; and the price he asked was a human price. He flushed again, this time angrily, and swore a round oath under his breath. Isabella clapped her two little hands over her shocked ears.

'Anything,' she repeated.

'Is the good smuggler's launch a fast craft?' asked Cingleton, turning suddenly to Pedro Gomez. 'A very fast one?'

'But yes, señor. It is a smuggler's launch,' replied the Spaniard with an air of finality. 'It

was built to escape the preventives.'

'I'll be back to-morrow,' said the Englishman curtly, bowing to the President and his daughter. 'By nine o'clock I shall return. You will be safe until then?'

'Assuredly. We shall hide safely for a few hours. Afterwards—ah! perhaps there will be no afterwards.'

'Won't be my fault if there isn't,' was all Cingleton's answer; and, with a second bow to Isabella, he ran rapidly down the long sloping spit of land.

'A bow only,' said Isabella, with a shrug of the shoulders, 'when he might have- Ah, Henry, Henry, caro mio!' She whispered the last words under her breath; then, feeling the delightful influence of them, whispered them again and again.

The full moon was slowly climbing its stately way through the intricacies of the skies as a fussy steam-launch swept into the harbour of Rio Santa Maria, the renowned capital of Tallisteria. Fully revealed in the midst of a shimmering track of reflected silver lay the long leaden bulk of a thirdclass cruiser, every spar and rope plainly silhouetted against the lightening purple of the sky. The chugchug of a moored boat came listlessly through the almost oppressive stillness of the night.

'Ah!' remarked Cingleton to the sphinx-like Spaniard at the wheel, 'the Immortal. She is still here, then ? That simplifies matters—if Kavanagh has had a good dinner'---- He finished the sen-

tence to himself.

'Si, senor, the Immortal. A fine vessel.' The smuggler said nothing further, but admired the outline of the cruiser appreciatively. He was a man who had an eye for lines of speed.

Eight bells tinkled softly across the water; the cry of the forebridge sentry answered as thunder answers the lightning. Then Cingleton ran his craft alongside, whispered to the gangwayman, and stood on the British planking.

'The captain is asleep,' said the man with that air of deference which implies that captain begins

with a capital letter. 'He dined ashore.'
'All the better. Waken him at once, and tell him I want to see him. Cingleton's my name.

Two minutes later a slim, boyish figure in silk pyjamas was peering amazedly through the faint light.

'How the devil did you get here, Cingleton? What's afoot? There's always a row on when you get on deck, you blighted stormy petrel!'

Cingleton dragged the young Irish captain away out of earshot of the curious gangwayman.

'Larks!' he said gleefully. 'Big, sound larks! Feel like an adventure?

'That's rather a useless question to put to a chap, isn't it? I grubbed on the beach with the governor. He has some sherry that'd do your heart good. It did mine.'

'That's the ticket. Then, are you game to'-There were five minutes of excited whispering, followed by a decided shaking of a close-cropped head.

'Couldn't do it, me boy. It's too big a thing. 'Twill be the devil and all if it leaks out. No. no, hang it all, Cingleton! If it were anything else; but that-no.'

Cingleton knew his man, and appealed to the sentiment that is in every Irishman.

'There's a girl in it,' he said softly, as a vision grew up out of the moonlit sea. 'A girl in it, Kavvy boy, for me.'

'Ye've salved me conscience, ye beggar. A woman? Never was Dennis Kavanagh deaf to a lone maiden's appeal. Bedad! I'll be best-man at the'-

'You'll do it, then?'

'Like a shot. There'll be the Old Harry to pay;

but-well, we're in for it anyway.'

That is why the third-class cruiser Immortal, Captain Dennis Kavanagh, picked up her anchors, both bower and stream, and slowly passed out between the frowning headlands of Rio Santa Maria. Sleepy engineers in the depths below uttered curses on the fate that lugged them out of their beautysleep at twelve midnight to work among odoriferous But on the bridge, far above the stench engines. of oil and the thud of resonant pistons, Kavanagh was greedily drinking in details.

'The very thing I wanted,' he murmured ecstatically. 'Ye'll find your friend a famous man yet, Cingleton sonny. It's been on my mind since I was on the Britannia; but what chance has a man of studying such things nowadays? Ye're a benefactor to the human race, if ye but knew it. But

won't there be a howly row?

The long night-hours glided past. Dawn grew suddenly up out of the radiant east, and the purple gloom of the sky vanished in rosy confusion. Far ahead of the hurrying bow, like a cloud, loomed the shores of Wisteria. Cingleton could hardly restrain his impatience. He paced fretfully to and fro, gnawing his fingers impatiently; and yet this was the man who had run under the spears of a hundred fanatical natives and dragged this same Kavanagh into safety. Kavanagh had never forgotten it.

'Be easy now, be easy,' said the latter. 'The colleen herself will be as safe as Barney's pig when the bailiff took it. What's the pile of imposing

masonry that towers up into the sky?

'The old palace—deserted now. No one has lived in it for years, ever since there was a plague inside the place. They say it's haunted.'

Kavanagh looked the solid piles of gray old stone up and down, and his eyes shone. Something dear to his heart was working within him, something that he had longed for for years.

'I wasn't at Alexandria,' he muttered, 'worse luck! but this'll be as good. You're sure there's not a soul in the palace?'

'Quite. But what's that got to do with it?
There are plenty of men about, bloodthirsty villains
who'll—— But there, that won't bear thinking
about.'

'Ye poor—civilian! Did ye ever hear of the Monroe Doctrine? The life of every man-Jack ashore there, no matter though they're all murderers—and the most of them are—is as sacred as the memory of the late Queen, God bless her! Ye'll see my tack in a minute.—Mr Swainson!' This to the address of the gunnery-lieutenant, who stood at his elbow.

He whispered to his subordinate discreetly, and Swainson left the bridge with the step of a schoolby off on holiday. 'With armour-piercing shell,' called Kavanagh as he disappeared; 'mind that!'

Well, whatever it is, said Cingleton hastily, 'you'd better hurry. See that thin red line? It's revolutionists making their way along the sandspit to the Point. The President and his daughter, are at the extreme end, hidden in a cave in the rocks. They won't be anything worth mentioning if you don't look alive.'

Did ye ever see the British navy asleep? An armed launch'll keep the beggars under; but we'll crate a diversion. That's what we're here for—to create a diversion. You watch.'

The Immortal glided into the richly set bay like a leaden messenger of wrath. No flag flew from her gaff; from a distance, allowing for the inexperience of any watching eyes, she might have been taken for any low-class passenger-steamer. A ramshackle fort on the end of the other sand-spit, that with the first mentioned composed the harbour, flung a tattered flag to the breeze as a sgnal for the approaching craft to display her colours. Kavanagh's square face gave no sign that

Cingleton watched a long straggling line of redcated, barefooted men racing along the sandspit. He held his breath as he gazed, for his heart-beats threatened to choke him.

Kavanagh whistled unconcernedly. 'Always remember the Monroe Doctrine, me boy,' he said

Oh, confound the Monroe Doctrine! Aren't

That I am. The toy fort is asking us to salute. We'll salute in a little minute. By the way, are there any of "our own correspondents" in that large

Elest if I know. But if you're afraid of the thing leaking out, I'll promise you, once the President gets back, there'll be no telegrams sent. And the cables are all cut; they always do that first.'

'Stainthe! That's all I care about. We don't court publicity in the navy, me boy. Unlike some other services which I needn't particularise, we do our little bit incognito.—I think the time's ready now, Mr Swainson.'

The ragged army of extermination that hastened so blithely along the sandspit spread out fanwise, and commenced an exhaustive search of the surrounding country. An armadillo would not have escaped that search for ten minutes. They chuckled loudly; the sound of their derisive voices came along the water like a message of dread.

But alas for their hopes of slaughter! The strange new arrival in the harbour was commencing to salute the flag. Well, it was only just; the new Republic deserved that mark of recognition. But a sudden exclamation from one of the leaders turned all eyes citywards. They were just in time to see a large piece of masonry detach itself from the old palace and fall in dusty ruins. Surprise held them speechless for a moment; then a roar of anger burst from two hundred throats. But a dull blue flash burst from the side of the lead-coloured steamer in the bay as if in answer, and a dull boom reverberated among the sandhills as another large lump of stone and mortar fell giddily.

Betrayed!' groaned one of their leaders, the redoubtable Fuegos himself. 'The cursed steamer from'— But from where? That he was not able to understand. No Power was at war with Wisteria; every other nation knew that the country was too busy with its own affrays to wish to take a hand in the game. Before he could find a solution the whole broadside of the Immortal flashed out with a crunching roar. The entire sea-wall of the palace crumbled away into itself like a shut telescope.

'Back to the city!' yelled Fuegos, his eyes bloodshot with a sudden fear. He knew that he was unable to cope with the emergency; more, his men knew it. He could see that, for at the word of command they threw down their rifles and stood sullenly about in groups. They were essentially land-fighters, and had no wish to combat an element they dreaded amazingly.

'We shall not return to the city,' exclaimed a score of voices, 'to be buried in the ruins! None but a fool would give the order!'

Fuegos stormed and raved, but his words fell on unheeding ears. Suddenly the gaunt cruiser swung its whole broadside, at a range of less than a thousand yards, upon the sandspit. It was enough. Like one man they broke and fled for cover. They had come to find a sheep and they had met with a very ferocious tiger.

Another long stream of figures had issued from the city, and was rapidly making its way along the sand to where the President was hidden. But these were not red-coated; they were chiefly women and children, though many of them were men. As they ran a hoarse roar rose from them.

'Where is Fuegos?' they asked. 'Bid him stop the firing of this devil's ship.' But Fuegos knew that he was powerless, and discreetly remained hidden.

'Give us a man to stop the firing!' the stream cried, and their voices rose in wavering shrieks. 'Give us a man!'

The ex-President saw his opportunity. He waited until the excited mob had halted within five hundred yards of his hiding-place, and then stepped slowly forth into the light of day. It was a risky thing to do, but he had won his position as president through knowing how to strike.

'Here is such a man,' he said simply. He had seen a well-known figure on the bridge of the cruiser, for he had been watching the experiment through glasses. Now he waved his arm, and the sustained roar of the cruiser's broadsides died away into palpitating silence.

'Here is such a man,' said the President again.

The crowd paused in astonishment at his daring. Then a simultaneous shout of 'Viva el Presidente!' went up through the air. He was their saviour, their protector; they fawned about his knees with ingratiating words. But the President turned away.

'A complete surrender only,' he said. He was not going to rely on half-measures. 'Bring the man Fuegos to me.'

They brought him, digging him out of a selfmade burrow. He stood like a convicted felon before the accusing gaze of the man he had ousted.

'Wash him first,' said the President disgustedly.
'Afterwards we will discuss his future;' and he turned resolutely away from the supplicants to meet two men who had landed from a launch and were coming in his direction.

'But it was too bad to fire on the city, señor capitan,' he said not very severely when Kavanagh was introduced. 'Think of the amount of damage to my poor people.'

'Devil a bit,' said Kavanagh with a broad grin.
'I only fired four rounds at the old palace, which Cingleton assured me was deserted. Every other charge was blank.—But where's the lady, Cingy boy?'

She was coming towards them as he spoke, and the impressionable Irishman stiffened like a ramrod. 'Bedad, ye lucky beggar!' he whispered, 'she was worth solid shot, let alone blank!'

'But how can I thank you, Captain Kavanagh?' asked Isabella de Cordeza.—'And you, Mr Cingleton?' turning to that worthy.

'Oh, I've done nothing,' he said, blushing before her gaze. 'It's all Kavanagh here.'

The sailor broke in excitedly: 'Satisfy us both, Miss de Cordeza. Let me be the best-man a month hence.'

She looked at Cingleton, and then her eyes dropped. He strode resolutely to her side.

'But for a best-man to be required there must be a husband. No one has asked me yet.'

'That's all right,' was all Kavanagh said. Then, taking the President by the arm, he led him away.
'Four rounds of armour-piercing shell has won

me a world-wide reputation,' he explained to the mystified Southerner. 'I'll tell ye what I intend to do;' and he explained volubly.

Cingleton looked at Isabella, and she was very full of a sweet confusion. Suddenly she laid her hand in his and smiled into his eyes.

Kavanagh's book, The Effect of Armour-Piercing Shell on Masonry, is now an accredited classic in all the navies of the world. Sometimes people ask him where he got his information; but he only winks, and says it was at a wedding. Then they say he has been drinking.

ODD MAN OUT.

Over the strip of garden ground,
That lies to the busy street,
Rings a shrill and a clear and a joyous sound,
A clatter of hurrying feet.
Is it a horn that harks to the chase?
Does it tell of a terrible rout?
Nay, 'tis Alick and Daisy and Minnie and Grace
Playing at Odd Man Out.

Once on a day, to our childhood's ken,
The playground grows dull and small;
Life is the field, and the players are men,
The signal is duty's call.

And whether we bide where the hearth-fires flame,
Or rove the wide world about,
We must all of us learn to play the game,
And play it as once by a humbler name
We played at Odd Man Out.

'Catch who catch can.' So the years go on,
And none of us stays their flight;
The boys are men and the maids are grown,
Like the fairy folk, in a night.
Yet not to the swift is the laurel crown,
Not to the bravest the shout;
But to him who cares nothing for smile or for frown,
Who has always a hand for the one who is down,
And dares to be Odd Man Out!

B. M. DANBY.

The MAY part of Chambers's Journal will contain the opening chapters of a new novel of military life, entitled

HOPPY,

By CAPTAIN CECIL NORTH, Author of The Moorish Treasure, &c.

. TO CONTRIBUTORS.

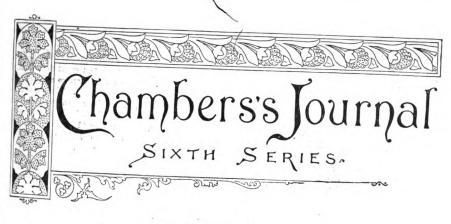

st. All communications should be addressed 'To the Editor, 339 High Street, Edinburgh.'

2nd. For its return in case of ineligibility, postage-stamps should accompany every manuscript.

3rd. To secure their safe return if ineligible, ALL MANU-SCRIFTS, whether accompanied by a letter of advice or otherwise, should have the writer's Name and Address written upon them In FULL.

4th. Poetical contributions should invariably be accompanied by a stamped and directed envelope.

Printed and Published by W. & R. CHAMBERS, Limited, 47 Paternoster Row, LONDON; and EDINBURGE.

норру.

By Captain Cecil North, Author of The Moorish Treasure, The Hermit of the Irati, &c.

HE dawn was slowly welling over the brim of the east when the monotonous throbbing of tom-toms, which throughout the weary night had persisted in the hot and tossing native city of Rhanibad, became lost

in a heart-stirring, muffled roar—once heard never iorgotten—which betokened the mustering of armed men. And such, indeed, was the case, for a dusky otentate, arising in his foolishness, had challenged the power of the Raj; and, reluctantly, the great Empress, after infinite patience and forbearance, had ordered that a lesson-which her horse, foot, and artillery confidently expected would be easily administered—should be given the misguided one as soon as her forces had forgathered. The day and the hour had now arrived; and, with blare of brass and rattle of arms, her white and her black soldiers were making ready to set the red game of Tar agoing, and were wending their way through the narrow streets in clattering columns of colour towards the great central open space appointed for

Frederic Lechmere Eustace Apner, known to his hiends as Hoppy, a polite rendering of the four mitials of his name—a lieutenant in the famous One Hundred and Sixty-first Rifles, commonly called the Sooties, and this morning in command of the gand at the Eastern Gate—came wearily down from the top of the huge wall by which the town surrounded, and from which point of vantage he had been keenly searching the neighbouring country for signs of danger, and got his men logther in good time to give the regulation salute the stern General, Sir John Ranger, who rode at the head of the troops. The enemy were known to the encamped, awaiting reinforcements, a few miles tray: a vast horde of them already, brave and inatical, but luckily poorly armed. No man doubted but that our well-trained boys, though hach inferior in numbers and, thanks to tinkering

politicians, lacking the stiffening of old-fashioned soldiers-who, if they were hard drinkers and famous scallywags, fought like fiends, and were the right men behind the bayonets when opposed to swarming swordsmen whom no leaden hail could stop -would give a satisfactory account of themselves, and demonstrate the superiority of science over courage and brute force. It was bitter hard luck, thought Hoppy, that his turn for guard-duty should have come round just at this time, when medals and V.C.'s were surely to be won; for this promised to be the first serious fighting that the nation had experienced for some years, and the good folks at home, and the special correspondents in particular, were eager to make much of everybody.

But now the long column—the debonair cavalrymen well to the front, and riding as carelessly as if they were playing at autumn manœuvres-is through the great gate, which closes behind them with a rumble and clang of metal; and the disgusted subaltern again takes up his post upon the wall, glass in hand, every nerve in his bodyalready irritated by a night spent in futile combat with myriads of thirsty mosquitoes-vibrating with the lust of battle.

With the exception of a sentry, whose blazing eyes belied his stolid regulation demeanour as he paced slowly backwards and forwards along his appointed beat of a certain number of yards, Hoppy was alone upon the wall, which, in the immediate vicinity of the gate, was forbidden ground to all but the officer of the guard; and as the tail of the column disappeared in a cloud of dust through a distant gap in a low range of hills he gave himself up to certain gloomy reflections caused by his bitter disappointment.

The only son of a soldier, old General Sir Ralph Apner, and at present the last of a great fighting clan-for the Apners have left their mark, their scarlet mark, almost as far as history goes back; and are not their tombs and effigies to be found in high APRIL 6, 1907.

[All Rights Reserved.]

places and in many lands?—it was borne in upon their representative that he carried that heaviest of all burdens: the weight of a great name from which all men expect great things. Never stinted in money—for his father was not only wealthy but generous-and engaged to be married to a lovely and charming girl, the Honourable Mirabelle Melgrove, heiress and only child of old Lord Idsworth, up to the present things had gone well with him, and he now only required to do something in the family profession, make his own particular patronymic ring through the land if only for a brief space, to justify his existence and add his quota of glory to the Apner halo, before leaving the army and settling down to a life of peace. He had long decided that a Victoria Cross should be the object of his ambitions, and here he was tied by the leg to a beastly gate, a position which any sergeant could equally well have filled, while his regiment was gaily marching away to the joys of a hand-tohand scrap with a mob of niggers, a species of entertainment which, history records, has always been prolific in opportunities of gaining the coveted distinction.

But there was another strong incentive beside the pride of name which had determined him in his resolution to win the V.C. Rich, good-looking, good fellow as he was, he had not had it quite all his own way with the Honourable Mirabelle. Among the many other aspirants to her hand had been a certain Captain Vare, who at one time had appeared almost likely to be successful in carrying off the prize. This man, oddly enough, was also in the Sooties, and consequently a brother-officer of Hoppy's; and—besides being financially as well, if not better, endowed than the latter, and goodlooking in a small and effeminate way-had while on some mysterious special employment in the dark places of Africa not only gained the 'Done Something or Other,' as irreverent subalterns call the Distinguished Service Order, but the Victoria Cross as well.

Mirabelle Melgrove, whose grandfather had been a well-known brewer, and the first of his family to figure in the Peerage, was, strange to say, coming from such a peace-loving stock, possessed of an intense admiration for the doers of doughty deeds; and her liking for Hoppy had almost succumbed to the temptation of becoming the wife of a V.C., D.S.O. Indeed, it was only when a cheap sneer of Vare's about Hops marrying beer came to her ears that the gallant captain fell into disgrace, and his rival, making the most of his opportunity, finally secured the lady's hand and became her affianced husband.

But the lost Victoria Cross still stuck in Mirabelle's mind; and once, when Hoppy, rather sick of the subject, alightingly remarked, 'Oh, V.C.'s nowadays are as easy as pap to get; you need only bring in a wounded man, with a special correspondent looking on, and have a clever woman to push your claims at headquarters,' she had

answered indignantly, 'That is a most unworthy and ungenerous thing for a soldier to say'-which was perfectly true—'and you ought to be ashamed of yourself. If these things are so easily got, you had better win one yourself. The regiment is going to India, and I hear from papa that the Cabinet fear that trouble is likely to crop up on the frontier. If it does, I will ask the War Minister, who is a dear old thing and my very devoted slave, to make sure that the Sooties get to the front, and then, my dear boy, you will have your chance. Of course, you won't run any risks if what you say is true; only, don't forget to have your friendly correspondent handy, and' here she broke into a smile—'perhaps you would like me to look after your interests at headquarters? Joking apart, darling, she went on, her momentary indignation having vanished, 'I really will try and get the regiment to the front if there is war, and I know that I couldn't do anything that would please you all better; and-who can tell?-there's many a true word spoken in jest. And if an opportunity does come-and that is the real difficulty-I know that you will take it. Oh, just fancy, my Hoppy, if at the end of the year which papa insists upon our waiting before we marry, you should be "Hoppy, V.C.," how splendid that would be!' And the impulsive, if somewhat foolish, maiden clasped her hands in an ecstasy of joy, and then hugged her lover as if she could already discern the little piece of bronze hanging

on his manly chest.

Much struck with his lady-love's remarks, it had at once dawned upon the repentant young soldier that here was the one thing wanted to complete the glory of the Apners, and he had forthwith made up his mind to leave no opportunity neglected which might hold out any reasonable hope of attaining his fiancée's desire. He therefore promptly expressed his firm resolve to attach the magic letters to his name on the first occasion that offered, and he had no difficulty in convincing Mirabelle—what lover worthy of the name would have not?—that the thing was as good as done.

As for Vare, when he had been informed of his rival's success he vowed to have his revenge, and he quietly began to make things as uncomfortable as he could for Hoppy in the hundred and one ways open to an officer when he wishes to get his knife into a subordinate. He had previously taken up the post of adjutant to the battalion, a position full of power as regards possibilities of harassing unfortunate subalterns, and during the tedious voyage out and the subsequent hurried scramble from Bombay to the border-for Mirabelle had made good her promise, and the newly arrived regiment, largely composed of young soldiers, had been sent to the front, much to the rage of several older and more seasoned corps—he had done everything he possibly could to irritate and provoke the mai who, he considered, had supplanted him.

And now had come Hoppy's chance—the battle which might have given him his V.C., and he was not to take part in it after all: the result, he shrewdly suspected, of a little arrangement of Varia. But the roster for guards and other duties was in the adjutant's keeping, and, like Cassar's wife, that official could do no wrong. So the unhappy subaltern had to grin and bear it, and comfort himself with the pious hope that the handsome, darkfaced little gentleman with the aquiline nose might return in a condition calculated to keep him off duty-nothing worse than that-for several weeks

The sun was by this time already hanging in the heavens, a great blot of crimson ink splashed on a gray sheet of blotting-paper; and Hoppy, recognising the signs which presaged a day of stifling heat, knew that when the mists had dispersed and the crimson turned to burnished gold he would be obliged to beat a hasty retreat to the shelter of his guardroom below. But he was not going to do anything of the kind just yet. At present his ears were strained to catch the sound of the guns, which he hoped he might be able to hear, at the beginning of the action at all events; 'for afterwards,' he said to himself, 'when our "Tommies" are busy thirying them, there will be no telling how far the beggars will go in the flush of a hot pursuit.'

From time to time a hail would come up to him from below: 'I say, Hoppy, old chap, can't I come p for a moment?' And then he would cross the broad top of the wall, and discover, down beside the surdhouse at the foot of the rough flight of steps lading to his post of vantage, some civilian friend on one occasion escorting a pretty bundle of cool, benbloned muslin—whose upward path was severely burned by a white-helmeted, perspiring sentry.

Awfully sorry, ye know,' he would shout; 'but it can't be done anyhow. Nobody allowed up here but the "orficer of the guard." Wish I could; but the orders are fearfully strict, ye see, for this is war, florious war—though we sha'n't see anything of it. Nat like the jolly old slack times at home.' And tis would be visitors would depart grumbling, karing him in peace to resume his eager watch.

Suddenly his ears caught the sound they were ruing for, faint, so faint as to leave him for a moment in doubt. He looked at the sentry, one of the few old soldiers in the regiment, and a man of the own company. A glance at his face was enough. He had halted in his monotonous walk and turned oraris the sandy plain. His khaki-covered breast, the were a couple of ribbons, was rising and alling rapidly; his nostrils were wide open, as if he that saifed on the close air the familiar, never'I do, sir.'

By Jove! your ears must be good ones, Rex.

'Hexperience, sir.'

'They seem a good while at it,' presently said Hoppy. 'I should have thought the niggers would have been well on the run by now, and the guns moved along after them.'

''Ope so, sir,' jerked out Private Rex; 'but them guns ain't a-goin' forrard, sir; they're a-comin' back, an' so's the rest of 'em. Hat least that's 'ow I read the noise. My Gawd, sir!' he exclaimed anxiously, 'cawn't you 'ear the rifles now plainly enough? It ain't the niggers as is runnin'. An' the gunners over there at the battery knows it too; look at 'em as busy as bees;' and he pointed towards a little flanking bastion some way along the wall to their right, which mounted a few guns of small calibre and commanded the approach to

And now the crash of the music that means death could be heard increasing in volume and proximity every moment; and the town, grasping the awful significance of the thing, began to hum like a disturbed hive. Bugles rang out; the slender garrison that had been left behind got under arms, moved through the narrow places in small detachments, took up positions here and there, and manned the walls wherever they thought their fire would be most effective. Hoppy's sanctum was invaded, his guard being reinforced by twenty-five men of a native regiment, and he was busily arranging for their disposal when his attention was attracted by a shout from Rex, who called to him to come back upon the wall.

'Quick, yer glarses, sir!' he said rapidly as his officer joined him. 'There-over there by that gap in the 'ills! It's an 'orse, that's w'at it is, an' full pelt fur 'ome, too!'

Pale with excitement, Hoppy focused the distant

'Good heavens!' he cried, 'it's one of the General's A.D.C.'s, and riding for all he's worth, without his helmet; and, yes, his left arm's slung in a belt! I must slip away back to the gate and prepare to get it open; and he rushed down the stairs again, his sword banging and clattering behind him.

Draw up some men across the road to keep the crowd back, sergeant,' he ordered sharply, 'and then open the gate;' and diving into the officers' guardroom, he quickly reappeared carrying in one hand a long tumbler filled for nearly two inches of its height with amber-coloured liquid, in which floated a miniature iceberg, and in the other one of those large-sized bottles of soda-water only to be met with in countries where the thirst is in proportion to the heat.

'Here, Tilloki Ram!' he called as he caught sight of his native servant hovering among the curious throng which was rapidly assembling behind the living barrier he had so wisely ordered to be formed, 'come here and take charge of this brandy and bubbly-water, and when the sahib who is riding

^{&#}x27;A gun, Rex ?'

^{&#}x27;la, sir.'

^{&#}x27;the there's another. Now the fun's beginning.'

One ought almost to hear the rifles, I should

in stops to speak to me, make the drink at once and give it to him. He looks as if he'd want it, poor chap!' he muttered as he once more used his glasses through the now open gate.

And, indeed, it hardly required the former to prove the truth of his remark, for the rapidly approaching man was plainly in an exhausted condition; and as his streaming Arab covered the last half-mile his rider swayed about so much in the saddle that it appeared marvellous he could keep in it at all.

As the horse came to a standstill in the gateway, stopped as much by Hoppy's grip on the rein as by any pull of his rider's, the latter would have fallen to the ground had it not been for the other's supporting hand. Besides the obviously damaged arm, the right side of the A.D.C.'s neck and body was dark with blood, which had freely flowed until caked with dust, from a severe gash across his face. His first sentence, 'For God's sake give me a dr'was cut short by the watchful Tilloki pushing the effervescing glass into his shaking hand, and for a second or two not a sound was heard except the gurgle of the grateful fluid as it carried its welcome relief down the parched and aching throat. Then came some terrible words, whispered low so that none but Hoppy could hear them :

'An awful business! Hopelessly cut up! Guns lost! Cavalry horses hamstrung! Neither native regiments nor the Sooties stood—no, by the Lord Harry! they didn't. We're falling back a demoralised mob. Where's Morrison to be found?'—this was the officer left in charge of the garrison. 'I've a message.'

'But hold on a second,' gasped Hoppy as the other straightened himself up and prepared to urge his horse onward; 'you can't go like that. I'll send a couple of men with you, if it's only to make a way through the crowds; but I can't understand it. Niggers without guns or knowledge of modern warfare to do this! It's impossible!'

'Guns!' cried the aide-de-camp, his voice now vibrating with passion and raised so that all could hear. 'Man, they'd guns enough and to spare, and leaders with dark faces but fair hair and blue eyes, who cursed in Russian when they fought; though the fellow who carved me cried out "Mon Dieu!" when I got him with the point. So I expect he was a swell; they talk French at the Winter Palace, you know. But I must get on,' he continued. And so, with two soldiers to help—one beside him, the other at his horse's head—he pushed his way through the gaping throng, leaving Hoppy standing overwhelmed with shame and sorrow at the dreadful news he had heard, and especially at this awful charge of cowardice brought against his beloved regiment.

But he had little time for idle speculation as to the real causes of the disaster; for that such the reverse amounted to he shortly had ample evidence. Debouching from the gap through which they had passed so blithely and confidently but a few hours

earlier, on their way to what the majority of them had looked upon as little more than a military promenade, could plainly be seen a confused crowd of humanity, black and white, horse and foot, wounded and dying, doctors, ambulance-men, dismounted gunners-the wreck of the proud column. But though broken and disorganised, honour was not completely lost, and Hoppy's heart leaped with a fierce pride as he distinguished some two or three hundred of his own men crowning the low hills and stubbornly holding the precious vantage-ground until their retreating comrades should reach the shelter afforded by the fire from the city walls. The General, he saw, was with these devoted oneshe could distinguish him riding about here and there, cool and watchful as ever; the imperturbable sowar-who still carried the 'headquarters' flag fluttering from his lance-head-and a couple of officers alone remaining of the brilliant staff of the morning. And Hoppy bitterly asked himself how could such things be? Where was our vaunted staff-college? Where the intelligence officers?

Slowly the retreating throng gets under cover of the guns on the wall, and then only do the men of the gallant rear-guard commence their retirement, which has been delayed until almost too late. For to right and left of them masses of the enemy are swarming, threatening to cut them off from the city and crush them by sheer weight of numbers. As it is, such is the fanatical bravery of the foe that, disdaining the heavy and well-sustained fire of the retreating Sooties, to say nothing of the screaming and bursting shells from the walls, which flatten them out in black-and-white patches as wheat is laid by wind-gusts, bands of them rush in to close quarters time after time, and, though they never get back to their comrades, send many a brave white spirit before them on the long, unknown journey.

But at last all is over, and the last fugitive—the General himself—is in. As the gate swings to behind him the haggard man says curtly to the officer of the guard, 'Keep it shut, sir, and see that none pass in or out,' and, riding slowly on with bent head and lowering brows, hardly appears to hear Hoppy answer, 'Very well, sir.' But he does; ay, and remembers it, too.

Then once more Hoppy gains his old position on the wall. The enemy, his prey escaped him, is promptly bolting for the cover of the hills, for the guns and rifles of the garrison ply him as holly as ever, and he has no stomach for that kind of work. But, alas that it has to be written! wherever a khaki-clad body shows signs of life he has time to stop, in spite of the whistling bullets, and use his keen blade with deadly effect, for the sake of his creed that teaches that an unbeliever killed is to free pass to paradise. It does not last long, this dreadful passage over the plain; but Hoppy grow sick with horror; and the awful curses and vows to reprisal which roll from the dry throats of his me find a savage approval in his innermost being which

he would have deemed impossible half-an-hour previously. And when, afterwards, in spite of every effort and order to the contrary, these vows were fulfilled, these reprisals carried out, by the maddened soldiers-creating much arm-chair denunciation in England at the time—those who had looked upon their dead that awful day could understand, and in their hearts forgive, even while they were obliged to bring their men to trial, condemnation, and punishment.

As Hoppy swept the now deserted plain with his binocular, he suddenly discovered something that mented close attention. Presently a sharp exclamation broke from him, and, hastily dropping the glass into its case, he hurried to the street below.

As he gained the bottom of the steps the hoarse

cry of 'Guard turn out!' rang in the air, followed immediately by the more welcome one of 'Guard turn in!' as the approaching officer signed to the sentry that he dispensed with the usual salute. It was Morrison, the colonel, who had commanded the town during General Ranger's absence, and who was now making a round of the wall and gates to see that everything was as it should be, before reporting to his chief.

'Colonel,' gasped Hoppy, 'Vare of my regiment is lying wounded a few hundred yards outside; he's some way off the road, nearly opposite the old tomb to the right of it. I saw him move, through my glasses, and, though it was only a spasmodic jerk of an arm, I'm certain he's alive.'

(To be continued.)

THE PASSING OF THE ANIMALS.

By EDWARD VIVIAN.

HE fact that almost every year sees the final extinction of one or more animal and bird species passes well-nigh unnoticed. These extinctions occur perhaps most frequently among

the more curious and abnormal raneties, many of them well worthy of sturdier attempts at preservation than the efforts which, in liew cases, are made. Even in recent years many species have passed into oblivion without so much as the manner of their going being heeded or

Though it has been estimated that the world possesses some three hundred and eighty thousand animal species, a single curious variety can ill be pared; yet in the last two or three centuries an healculable number have passed away for ever. Extermination proceeds apace. Out of fourteen rancies of birds found a century since on a single ikand-the West Indian island of St Thomas—eight bare now to be numbered among the missing.

The increase of every creature, says Darwin, is contantly being checked by unperceived hostile gencies. By such hostile agencies a fatal decline in the numbers of an animal is sometimes brought the things are the state of the through all the ages; and although the human race d late has been a contributing factor in the doom of many animals, in numerous instances man has but hastened what would in any case have been

The large bounties given by candidates for the larger of the Roman populace in ancient days when and beasts were pitted against captives or gladiators in the arena of the Colosseum assisted in depleting Northern Africa of its larger fauna. In those days the hippopotamus inhabited Lower Egypt, and indeed two were killed by an Italian, Dr Zeringhi, at Damietta as recently as 1600; and according to Sumini de Manoncourt and Buffon, the hippopo-

tamus became extinct in the Lower Nile near the Mediterranean at no more distant date than 1658.

In animal extinction Africa in recent centuries has suffered severely. It has lost for ever the quagga, which, though once plentiful, was exterminated by about 1865; the bluebuck (or blaauwbok), destroyed by the Dutch, according to Sir Harry Johnston, in the early years of the nineteenth century, Mr Lydekker putting its final disappearance at a still earlier date; and the white-tailed gnu, which, if it has not entirely vanished, is on the very verge of extinction. The square-lipped and miscalled 'white' rhinoceros and the South African gemsbok are rapidly approaching a like fate, and the geographical area of a large number of other African animals is diminishing year by year.

But, deeply as Africa has to deplore her losses in animal species, the islands of the Indian Ocean have suffered equally by the extirpation of many noteworthy birds. The greatest celebrity amongst these is certainly the time-honoured dodo. When Mauritius was taken possession of by the Dutch in 1598, the dodo was a comparatively common bird. So helpless was this great flightless pigeon, however, and so useful was it for food for seamen and settlers, that in less than a century it had completely vanished. Leguat makes no mention of it as being there in 1693, and the last record we have of it is contained in the journal of one Benjamin Harry, when on his homeward voyage round the Cape as mate of an Indiaman in 1681. Two other great birds of Mauritius, the flightless rail and the giant coot, also perished utterly in the seventeenth century-the latter bird surviving to almost the end of the century and outliving the rail by nearly eighty

No specimen of the dodo's near relative, the solitaire of Rodriguez, ever reached Europe. Common at the beginning of the seventeenth century, they were practically non-existent by the middle of

the eighteenth. The white dodo of Bourbon, first described in 1613, was on the verge of assured extinction sixty years later.

Another famous bird, the gigantic epyornis of Madagascar, was still existing, some think, in the eighteenth century, since one European is stated to have seen it alive in 1745, though the evidence of this is exceedingly uncertain.

The valuable feathers of the ostrich provide against its wanton extinction by man, though most of its kindred have already passed or are doomed. The date of the extermination of the moa is still a debatable point, though it is possible that the last members of this huge race were destroyed by the Maori immigrants into New Zealand from three to five centuries ago. The small black emu of Kangaroo Island, plentiful in 1803, was wiped out in less than a score of years. The Tasmanian emu, too, has been hunted to extinction, a fate towards which, according to Mr Hudson, at least one South American rhea is also tending. A relative, the wingless kiwi or apteryx of New Zealand, one of the most singular birds in the world, will probably soon become extinct.

New Zealand has also lost many other notable forms, among them the dog formerly to be commonly observed in the native villages, which had accompanied the Maoris to New Zealand from their elder home in Polynesia. Another flightless rail, the largest of the blue water-hens, is believed to have become extinct at no considerably distant date; and the New Zealand quail, a common gamebird half a century ago, has been exterminated. The Norway rat, imported into New Zealand, has compelled the native black variety to seek a final refuge in the forest recesses.

Asia has been decidedly more fortunate in animal preservation in recent times than any other continent. Its most serious losses have been the extinction of the tarpan, that small dun-coloured wild horse of the Kirghiz steppes, and the destruction in 1894 of the Pere David's deer kept in the Imperial hunting-park south of Peking. This latter animal, however, still survives in small numbers in several European collections.

In Europe, all the few large wild animals remaining hold ground of uncertain tenure. The last wild aurochs appears to have been killed in Poland in 1627, though degenerate descendants, many of them of feral stock, still linger in the parks and reserves of Eastern Europe.

In the United Kingdom the destruction has been most thorough. The last wild boar in Britain passed before the reign of Charles I.; the wolf was exterminated in Scotland in 1680, and thirty years later the killing of the last wolf in Ireland finally extinguished the race in the British Isles.

In Europe the beaver, which, according to Giraldus Cambrensis, lingered in Wales till the twelfth century, retains a precarious existence. In Holland they died out in 1825; in the tributaries of the Rhone, the Rhine, and the Danube colonies of

beavers maintained a foothold throughout last century, and a few scattered remnants still remain. In Livonia, where they were common in 1724, they were destroyed before 1850; though in Poland, Lithuania, and several other Russian and Siberian provinces they have not yet been entirely extirpated. About a hundred remain, perpetuating the race, in the streams of Norway.

The bison roamed the North American prairies in millions in the middle of the nineteenth century. For thirty years previous to that time the ruthless slaughter of these magnificent beasts by bands of Indian hunters made serious inroads among them. Vast numbers remained, however, till their doom was fixed by the construction of the great trans-American railways, and they passed away for ever from their native prairies. In carefully protected reserves a few small herds still exist, the largest and most flourishing being that inhabiting the Yellowstone Park, where the two hundred bisons estimated to be segregated there in 1884 had increased to three hundred when counted eight years later. Ten years ago a little herd lingered in a remote county of Texas. In President Roosevelt's opinion, there are still a few wild bison frequenting the Rocky Mountain range from Colorado to Saskatchewan, although these are a slightly different

Another vanished creature as celebrated for its untimely fate as the stately bison is the great auk. Before 1800 this bird was common even to abundance upon the rocky coasts and islets of the north. By 1825 it had become rare, and twenty years later the last known specimen was wantonly killed.

Whether the animal of which De Flacourt wrote in 1658 was in truth the giant lemur of Madagascar or a form closely allied to it is now impossible to determine; but it is practically certain that this remarkable animal was existing at no enormously remote time.

Among marine creatures extinctions are less noticeable, because less easy of verification. The Antarctic fur-seal—of which it is said that millions were killed by avaricious sealers in forty-five years—it is not to be wondered at, has ceased to be observed. The sea-otter of the North Pacific, the West Indian seal, and the gigantic sea-elephant of Southern oceans have been savagely pursued till rarity threatens to become something still more serious.

In 1741 a noteworthy animal was discovered by Behring on the islands off the coast of Kamchatka. This was the giant member of a strange race, an enormous toothless manatee from twenty to eight-and-twenty feet in length, and to be afterwards known as 'Steller's rhytina.' Steller, the naturalist who accompanied the expedition, advocated their use as food for the sailors. His advice was faithfully followed, and so assiduous was the pursuit that by 1768, less than twenty-seven years after their discovery, the last rhytina had been slain, and an interesting species completely blotted out.

On the same voyage during which the rhytina was found, a new cormorant, also the largest of its kind, was discovered. This, too, was doomed to premature extinction, though it survived the unwieldy rhytina some seventy years.

Of the tortoises, with which the Mascarene and Seychelles Islands swarmed two centuries ago, few specimens have survived to our times, despite the centenarian age attained by some individuals. The huge tortoises of the Aldabra Islands, so plentiful in former times, are known no longer, save by a

solitary species, in their native haunts. The colossal chelonians of the Galapagos group supplied so delicious and so greatly esteemed a diet that in twenty years the rapacity of ships' crews made sad and irreparable havoc among them.

Among snakes, the passing of the yellow boa, formerly so abundant in Jamaica, presents us with a remarkable instance of the dangers attending reckless and ill-considered animal acclimatisation, an instance which is pregnant with both romantic and zoological interest.

THE LUCK OF THE 'GOLDEN CRESCENT.'

By Commander E. HAMILTON CURREY, R.N.

PART I.

UT 10 per cent., my dear captain! 'Take it or leave it, Grub; it's my last word in the matter, anyway. I'm thinking Pfungst of Hamburg, or Crellier of Toulon, or De Silva of Lisbon would make it

122; but I'm all for dealing in my own country, and the British sovereign rings with a clearer note than marks, francs, or duros. So you see I am really making you a generous offer.

'But 10 per cent. !

'Oh, for Heaven's sake, don't go on repeating that like a West African parrot! Is it or is it not

The seene was the office of Moses Grüber, of the arm of Volsuss, Schmidt, & Grüber, dealers in 'hardware,' which hardware usually took the form of lethal weapons desired by peoples on the outskirts of civilisation. We must assist these struggling peoples to attain to their inalienable right of freedom, was the sympathetic tone taken by Moses Grüber, and the hard-bitten adventurers with whom he dealt laughed consumedly and smote him violently on the back.

As invisible as Jorkins, of the firm of Jorkins and Spenlow, were Volsuss and Schmidt. No man had erer seen them; but to listen to Moses Grüber when taking on a deal, you would have thought that their weight in the firm was far greater than that of their humble spokesman and mouthpiece, who attended regularly in the dim, cavernous office at 1000 Cannon Street, E.C. 'Volsuss was doubtful, and Schmidt had almost decided to have nothing to co with the contract,' were phrases frequently in the mouth of 'Old Grub,' as his customers familiarly alled him. To-day Captain Heriot of the British mercantile marine lounged back in the familiar bathern arm-chair, and through a blue haze of big excellent cigar-smoke regarded Moses, who at at his roll-top desk in a revolving chair. Between them a bottle of champagne and two capacious wine-glasses formed an agreeable accom-Plaiment to conversation, for Moses was one of

those astute practitioners who ever threw out a minnow to eatch a whale, and had none of the petty meanness which stands sometimes between a man and considerable financial operations. Moet and Chandon '90 and unapproachable cigars had clinched many a bargain with a possible I per cent. more in favour of the firm than had been anticipated by its worthy representative.

'But listen, my dear captain,' went on Moses, filling his companion's glass to the brim, 'times—as who should know better than you?—are far from being what they were. Take the matter of that last consignment to South-West Africa. Why, your friend Pfungst of Hamburg was actually undercutting our firm there, although the Hereros are fighting against his own very disgusting countrymen; and even though we did secure the contract, we were really dreadfully cheated by that halfbaked Boer Schlopper, who made the arrangements.'

Heriot knocked the ash off his cigar into the waste-paper basket and laughed. 'Half-baked! Schlopper! My dear Grub, if you raked the continent from the Zambesi to Table Mountain you wouldn't find a harder shell than covers Hans Pieter Schlopper. You and your contracts! You wouldn't accept my offer then, and you burnt your fingers, and serve you right.

'Is it always that I should entrust myself to you, then?' inquired Grüber, with a furtive glance at his companion.

'What did you clear over that last job with Georg Philippopoli, the Albanian, who managed that for you?

'I must admit'-

'I don't care what you admit or what you don't admit. It was 55 per cent. clear net profit, and I know it as well as you. Again, in that matter of supplying the Ras between Harar and Jibuti, your share panned out 45 per cent. Now, I executed both commissions, and 10 per cent. was all I asked and got. It's what I am asking now; and, as I've said before, if it wasn't for the exchange I'd take myself off to Pfungst or Crellier. Why, man, they

don't haggle like you, and haggling's none to my taste.'

'But the price of the article, captain, has risen.'

'Oh, don't tell me that no European army is changing its small-arm equipment at this very moment of time. I know that quite as well as you do; but I know, and you know, where the stuff's to be got. Now, look here, Grub; your champagne's as good as they make it, and I find no fault with your cigars; but there is hurry toward, old man, and if we don't deal I start for Marseilles to-night, as I see my way to screw an extra half per cent. out of Crellier, so don't let's barge any more. Is it to be 10 per cent. or is it not?'

Captain Heriot lifted his six feet of bone and hard muscle out of the arm-chair and strolled over to the murky window, and stood, cigar in mouth and hands in pockets, gazing on the tide of traffic

in Cannon Street.

Grüber sat motionless in his office-chair, staring at a calendar in front of him. He had made a hard fight for 7½ per cent., but with little real hope of success, and in his inmost business soul—his soul contained really no other ingredients—he liked the reckless, debonair sailor none the worse that he had come off second-best in the encounter.

'Come and sit down, captain. You drive a hard bargain; but, then, so do I. I agree to the 10 per cent. net as your share. And now tell me what the contract is and what we have to provide.'

Heriot resumed his seat. 'Right! Then it's a deal, so I'll light a fresh cigar before I start my yarn.' He suited the action to the word, and leaned forward with one elbow on his knee. 'You know, of course, that whatever London and Paris may think of the entente cordiale, the sentiments in Fez and Marrakesh are not quite the same?' Grüber nodded. 'Also, that every petty border ruffian from the Atlas to the Atlantic is kicking up his heels and exacting tribute on his own? Very well. Where our particular consignment is to go doesn't matter very much to you and me; but I did hear that Ain-Sefra, Figuig, and El-Abiod-Sidi-Cheikh were likely places for a rumpus before long, and the French Tommies of that thundering lost legion of theirs, the Algerian penal battalions, are likely to have quite a lively time of it. What? No, it ain't a Jehad, as far as I know; nothing holy about this war, only a general dust up "tras los montes," as the Spaniard says, to keep things humming and to encourage "peaceful penetration.";

'What's the figure?'

'Ten thousand carbines and a hundred rounds a gun.'

'What are they prepared to pay?'

'Quite enough for you to make your usual profit and a bit over, old man. Wherever the money's coming from I don't know, but there seems to be plenty of it.'

'It will be dollars on the nail, I suppose?'

"Al contante," to quote the Spaniard once more, answered Heriot.

'They will want samples?'

'Of course. I take a couple out in a dandy leather case, and tell 'em I 'm going to shoot birds—at the Custom-Houses!'

'What difficulties do you foresee?'

'French cruisers messing about and asking inconvenient questions. The English don't care a rap; besides, it's too far south for the destroyers from Gibraltar.'

'What ships are on the station?'

'There's the Galilée—quite an old friend, by the way,' Heriot laughed.

'However, you can arrange for her, I suppose?'

'Lord bless you, yes. As far as that goes, I can hunt them all off, and shepherd them into one port.'
'How?'

Heriot winked and slowly finished his glass of champagne.

'My dear Grub, if I couldn't do that much I shouldn't be fit for this trade.'

'Still, as a matter of curiosity?'

'Simple as falling out of a tree. Listen. As soon as I'm ready to start I advise my friends on the coast; it's Mahazen I'm bound to, and I call in at Gib. for orders from my owners; rather out of my way, as you observe, but necessary. I wire from there to Tangier the exact date and approximate time I arrive at Mahazen, and our old friend Don José Montero does the rest.'

'Yes: and what does he do?'

'Why, engineers most terrible disturbances in a couple of the coast towns. A few duros to the tribes outside, and a few more to the Bashaws inside, does this, and then alarming paragraphs appear in the European papers. Then Ben S'liman the Jew takes a hand in the game, and sends frantic petitions to the Bashadors of all the European Powers at Tangier to send men-of-war to protect their wives and families. The Ministers-Plenipotentiary cannot, of course, resist the appeal. Off go all the cruisers available—it's probably only one. or two, or three at the most. Ben S'liman-well named, ain't he?-meets the captains with a deputation of trembling inhabitants, and thanks them with tears in his eyes for saving the honour of their wives and daughters; the men-of-war fire salutes to the Moorish flag, the ferocious tribesmen indulge in "powder play" outside the walls to give an air of reality to it all, the men-of-war stop ten days or a fortnight, quiet is restored, and they then return from whence they came. That's all.'

Grüber laughed loudly. 'And when will the

comedy begin, captain dear?'
'We sha'n't ring the curtain up till you are ready.

How long will you be?'
Grüber turned to his desk and pulled out a drawer, and between the puffs of his cigar his companion could hear murmurs, 'Birmingham, Sheffeld, Amiens, Liége, Essen, Bilbao—no, Barcelona—Toulon.' The murmuring stopped. 'Are they in a hurry?'

'Soon as convenient, but nothing very particular.'

'Right! Then, say a month. Carbines, I think you said. Oh! a horseman's weapon. Quite so. Samples to-morrow, captain. No buckets, I suppose ?'

Heriot laughed. 'The men who'll use 'em carry 'em ready loaded, and mostly shoot at sight, so they wouldn't have much use for the like. So now it's a deal, and we understand one another, I'll go and order the dandy leather case. I shall go overland to Gib. to save time, and pick up a coasting-steamer there. I shall start on Monday, and be back under the month. The Golden Crescent is ready, and I shall find the hardware aboard when I come back?'

'A cargo of musical instruments for the ports of southern Spain,' replied Grüber with a grim smile.

'No doubt they will make much music which some will listen to for the last time,' said Heriot as he reached for his hat.

'Shall I see you again before you go?'

'No, I think not; but you may rely on all arrangements being made, by the time I get back, on my side, and I feel equally sure that the band instruments will be aboard by that time.'

'You can trust me for that.'

Heriot skipped lightly down the stairs and boarded a motor-bus, while Moses Grüber wrote letters in various languages addressed to hardware merchants in different parts of Europe.

(To be continued.)

DID THEY FIND THE SUNSHINE?

ACK fogs and the influenza reigned over London that December time. The electric light played practical jokes, going out at inopportune moments, creating confusion and

loss, and angry and retrospective groans for the more reliable, if less flashy, light of other days. Christmas shoppings were pursued under difficulties; but mountains of rubbish melted away as usual at the sales, so-called bargains being eagerly clutched by silly people, to be mourned over at leisure in the home, when daylight and commonsense showed up the dirt and the worthlessness of the purchases.

Two victims of the hateful influenza sat convalescing over their fire one evening. They were members of the much-reviled 'classes,' to borrow one of the catchwords emanating from the owner of that envenomed mind who was capable of such great things, and who stooped so low at times, doing such irreparable harm, making such cruel mischief, causing such needless strife.

The family doctor prescribed Southern sunshine for the pair with whom we are concerned; and rather reluctantly at first—for influenza leaves little energy in its wake—his prescription was carried out. To some there is always a slight feeling of cowardice in flying from winter in the homeland, but illness excuses much. 'We will go, and we will go far, as go we must,' they said.

ley rain and cold winds met the shuddering travellers as they sought shelter on the fine turbinesteamer Invicta at Dover. A coughing crowd sat about the decks, huddled in rugs and wraps, all bent on the same errand—that of attaining the Sunny South. The Invicta thrashed steadily through the rising sea, heedless of the coming sale and driving rain. The ordeal of the clamouring porters and the Custom-House at Calais successfully come through, corner places in the train secured, the dreary monotony of the sodden landscape and the warmth of the train conduced to

sweet slumbers lasting almost until the lights of Paris flashed in the eyes.

Certainly the paving of Paris is greatly improved, and the fierce jolting of the cab-drive from the Gare du Nord to the Gare de Lyons is a thing of the past. The taximeter cab, too, has its advantages, in that you are no longer exposed to the ferocious invectives of its shiny-hatted driver demanding double his legal fare.

After an elaborate repast at the buffet at the Gare de Lyons, where the dishes were many and the edible quantities small, with a sigh of comfort the travellers settled into a warm compartment of the sleeping-car. Night wore away in broken snatches of sleep with one of them, whose nerves were agog with dregs of illness and recent accounts of piteous railway accidents. A sudden awakening, and a strange, soft noiselessness in the procedure of the train became apparent, with abrupt and alarming stoppages. A hurried clearing of the hazy window revealed to the startled eyes a wide white landscape, a driving wind, with drifting snow. Did they seek the Sunny South for this? No harm accrued, however. The gallant, carefully driven train forged steadily southwards through the night; the snow was left to follow on if it would; and that exquisite corner of the world beyond Toulon did not belie itself, but lay sleeping in the morning sunshine, the sapphire of the Mediterranean breaking in dazzling diamond spray on the red rocks below. This, and the hospitable welcome to the house of a friend in a sunny Riviera town, made up for much; but, alas! the very next morning that dream of summer was dispelled. A rude awakening to the banging of the shutters, the yelling of the mistral, to the sight of the torment of palms and olive-trees twisting and whirling in the blast, combined with intense cold, conduced during the days that followed to a state of mind verging perhaps on the irritable, with deadly depression.

Then one morning a blessed silence reigned. A blaze of sunshine flooded the rooms as the shutters were flung back. The palms and olives waved in a soft and gentle wind. The roses that remained lifted up their heads. Oranges glowed like golden globes among their dark foliage, kissed by the sun. The cloud of sickness, depression, and darkness seemed to roll away, and a happy feeling obtained that what had been sought was found.

Delightful days, however, have a way of slipping by, and moves must be made in this world of change. It is a far cry to fair Sicily, the bourn the travellers decided to make for; but journeying is made very comfortable and easy, if expensive, in these days. The emissaries of Mr Cook are friends in need, simplifying matters to the inexperienced and experienced alike.

The massive train, with its restaurant-car, rolled heavily away towards Italy one fine morning; and tidy, well-organised France was left behind. Smiling custom-house officers at Ventimiglia made no difficulties about luggage, which they examined very cursorily in the train. Monaco hung over the sea; dejeuner was ready for the travellers, and so were the travellers for dejeuner. A great cosmopolitan gathering were seated at all the little tables in the dining-car, and a German family occupied one table near our travellers. For some reason best known to themselves they pretended to be English, and talked English industriously and loudly to each other. They consisted of 'dear papa' and 'dear mamma,' as they called each other, and of two young people. The young man with a gold pincenez bestriding his thick nose, a wiry yellow moustache adorning his thick mouth. He already showed signs of growing through his sandy hair. In time he would be a replica of 'dear papa,' whose outlines had become obliterated by the ruthless hand of Time; and his sister would favour 'dear mamma,' whose tier of chins settled comfortably into her lace collar and reposed on the metal brooch at her throat; though at present in the daughter the chins were but hinted at, and the heavy nose of dear mamma, with its red and bony bridge, was fine and softly modelled in the daughter's.

All went well; conversation flowed freely; the entables were all that could be wished, the slabs of veal rejoicing the Teutonic heart in so much that, alas! dear papa suddenly gave the show away (to borrow the phraseology of to-day) and poured forth a flood of guttural German, responded to peevishly by 'dear mamma,' to the infinite disgust of their daughter, whose rounded periods of rather governessy English had been a joy to herself at any rate. After this little was said, and a gloomy silence reigned. 'Dear papa' looked a little said.

Change into the sleeping-car at Genoa for Rome and Naples. The Paris train very late. A warm and comfortable night; but, alas, the disappointment in the morning! Sodden gray skies, dripping trees, heavy clouds as far as could be seen. The Campagna stretched mournfully away to the far horizon, chill and colourless in the cold light. Here and there a note from the dim past was struck

in broken arch or aqueduct; then the train rolled into the station. Rome! There the meaning of Rome was a visit to the buffet, excellent coffee, rolls, butter, troublesome porters and fussing travellers: but what bathos! Rome!

A crowded train to Naples, corner seats once more cleverly achieved, rug-rolls stowed in racks, perhaps a shade too many little things, justifying the complaints of the disagreeable American widow who sat largely on her rights and read her Taucknitz contemptuously, regardless of the scenes through which the train was rushing.

Another restaurant-car, with less good food, and in due time Naples. As they were chilly and tired, the night-journey on to Taormina from Naples was deprecated by our travellers, and a night in 'La bella Napoli,' with a morning at Pompeii, suggested themselves pleasantly.

A very big hotel, very decorative, with florid ornamentation wherever such was possible, and a crowd of servants—cormoranti, as they were dubbed by a vivacious lady with a limited knowledge of the Italian language, and resentful of the unconscionable number of open palms greedy for tips. 'Go away, go away; you are all cormoranti,' she would say. 'Allez, allez!'

'All this show usually means inferior cooking,' cynically remarked one of the travellers, and the result bore out the truth of the remark. Watery soup, fried octopus feelers apparently, insides of sorts (the Italian greatly favours insides), regaled the weary pair in that gorgeous dining-hall, with its white and gold, its cupids and roses. At the next table to theirs sat a noisy company of Italians, all very fat, all very fond of toothpicks. Why is the modern Italian, the frequenter of hotels, restaurants, railway carriages, usually so very fat? 'Their legs are all set too far back,' remarked the most observant of the travellers; 'they are like penguins.' Occasionally, however, a man appears on the scene who might have stepped out of a canvas by Titian or Moroni. One such occupied another table near our couple. Race was written in every line of him-in his dignity of gesture, his beautiful hands. His eyes roamed the room in search of a pretty face to gaze upon while he ate his There were solitary dinner. A futile search. varieties of Americans in wondrous hats, a black woman with wondrous rings; then there entered a little girl with a face like a rose, and a faded mother, and he was satisfied, but never did his breeding belie itself.

In Italy it is necessary to protest against the dearth of blankets on Italian beds, one thin blanket and cotton counterpane being all the covering allowed as a rule—a serious matter to shivering seekers after sun and warmth, unless duly armed with rug-rolls. How interesting to see Pompeii! thought our pair as they retired to bed.

Naples is a very inferno of noise. The incessant trams, the cracking of whips, the yells, the objurgations and cursings of the drivers of the miserable beasts of burden, make day and night hideous. In sunshine all this might be borne with more or less of equanimity as 'part of the show;' but with a bitter wind, driving rain, and a cold, gray sky super-added, Naples is not the haven where one would be.

added, Naples is not the haven where one would be. Such a day dawned upon our travellers. Pompeii was out of the question, but there still was the Museum, which ought to be visited-vide Baedeker and Murray for descriptions of the priceless treasures therein. An imposing building. A lira is charged for entrance on certain days only, so they my! Well warmed are the spacious halls, and the grand marbles may be gazed at in comfort—such comfort as is allowed by that insufferable bore the cicerone, who, hungry for tips, dogs your footsteps, pouring forth descriptions in his nasal voice and in such languages as are at his command, all more or less incomprehensible, while you are longing for quiet moments in which to contemplate the wondrous art of the dead ages. How is it possible to revel in the beauty of line, the dignity of exquisite pose, the simple grandeur of drapery, with a husky patter at your elbow, interrupted only as the patterer pauses to expectorate—every facility being afforded for this filthy habit in every room? There is a great shock in store when the Pompeiian treasures (of which there are an immense number in the Museo) are inspected; a feeling of hurt, almost as of a wound, is experienced that hand and brain capable of such marvels of skill should be turned to basest uses, and obscenity be the theme often chosen and revelled in; a sadness, too, that such things should still be in existence, and have existed for thousands of years, when they would be better broken up and crushed into road-mendings. The rooms with the ornaments of gold and silver are interesting and pathetic: the delicate adornments, necklets, anklets, bracelets, lovely in workmanship for the fair women who perished so pitiably; also, the glass and ceramic ware, the shapes of which have been reproduced so frequently, with their colour. The cases of gems would repay close study; so would, doubtless, the papyrus rolls the learned.

In howling wind and driving rain the travellers turned their backs that night on 'La bella Napoli,' with scant wish to see her, and certainly not their

hostelry, again. Another crowded train, another night of nerves to one of them, but an awakening to an exquisite dawn, a citron-coloured sky, with a quiet Mediterranean, groves of orange-trees in full bearing, olives, prickly pear with its strange fruit, a glorious sun, gilding, glowing, rejoicing the heart.

At Villa San Juan the occupants of the train are turned out, and go on board the ferry-boat for Messina. Part of the train also goes on board the boat. What the boat does when there is a sea on is hard to imagine. That morning there was but a gentle swell, but it was enough to produce a feeling as to top-heaviness and wonder. Sunshine flooded the scene; the air was like a bath, sweet, sun-filled, refreshing. The sea sapphire and diamond, the great Calabrian mountains snowcapped, Sicily smiling. Excellent coffee was served on the ferry-boat, grateful and comforting, and the little trip across the Straits of Messina was all too short. Traces of the troubled times of last century showed up in cruel marks of shot and shell on the walls of Messina. Two or three obsolete Italian warships lay at anchor in the harbour, looking as though they had lain there ever since. There was the usual atmosphere of laissez aller and festa peculiar to Italy over all, the glorious sunshine aiding and abetting.

An hour or two of leisurely train-journey through lovely scenes: orange-trees, olives, rugged hills, the wonderful brown and red and cream-coloured houses of Italy, wide flats, fishing villages hanging on the hills and creeping to the shore, and the great plain of the sparkling sea.

A stop, and here is Taormina; here, too, are the beggars hanging round the little station with untold and horrible wounds and disfigurements. This, then, was the bourn of the journey for the time being, the spot wherein our travellers hoped to lead a lizard-like existence of basking in the sun among orange-groves and flowers, of making many sketches of ruined temples, studies of the grotesque prickly pear, impertinent attempts to reproduce the snowy slopes of Etna, with his plume of smoke, his crater, his sunset effects, his pomp of dazzling white, his regal purples. Are their hopes to be realised? 'Chi lo sa?' ('Who can say?'), as they say with a shrug in this land of cypress and myrtle.

FINANCIAL PANICS.

By H. W. CARTER.

UBLIC attention has been more than usually drawn to the present stringency in the money market. The causes are apparent. One especially is often overlooked: that Great

Britain is the only country where gold can be immediately demanded in payment as a legal obligation, however great the sum named on the draft.

The frequent recurrence of 'dear money' from a want of elasticity in our monetary system imposes severe penalties on the entire commercial community. Many persons watch the movements of bullion with as much curiosity, if not anxiety, as they would foreign fleets. The nation that holds the most bullion, unless its people become degenerate, will always be a great Power.

The Chancellor of the Exchequer has promised

to give prompt and careful attention to the subject. It is obvious that any Government calling on our great banking institutions to hypothecate a portion of their stock of cash to a bullion-reserve must set them an example, or risk gradual depreciation of the country's enormous resources. Any law must be equally applied, as in these times a Government cannot entirely shield themselves under the plea of unquestioned security. It is interesting to recall some financial troubles in past times.

The year 1866 opened amid a feeling of uneasiness and distrust in commercial circles. The Limited Liability Act of 1862 had led to the formation of numerous companies, many of which involved their shareholders in heavy losses; the result being that batches of securities were thrown on the market in wild panic. Early in the year the London Joint-Stock Company failed for a large sum, followed in April by Barnard's Liverpool Bank closing its doors. On 2nd May the Bank rate stood at 7 per cent., on the 8th May 8 per cent., 9th May 9 per cent., 10th May 10 per cent.

On the latter day Overend, Gurney, & Company, Limited, applied to the Bank of England for assistance to the extent of £400,000. On their application being refused, about half-past three in the afternoon the great Lombard Street house closed its doors, with engagements amounting to £19,000,000.

On the following day the Agra and Masterman's Bank, English Joint-Stock Bank, Consolidated Bank, Bank of London, and European Bank stopped payment. The Bank of England reserve, which had been £6,500,000 in the middle of the previous April, had decreased to £859,000, as shown in the 1st of June returns. For the third time since 1844, the date of the Bank Charter Act. the Government rendered aid. At a late hour of the evening of the 11th May, commonly known as 'Black Friday,' Mr Gladstone announced in the House of Commons that the Government would support the Bank of England if they issued notes beyond the legal limit. A stipulation was that a minimum of 10 per cent should be charged for advances. As a fact, fine paper paid 10 per cent. to 15 per cent. till August of the year.

On 13th December 1869 six directors of Overend, Gurney, & Company, Limited, were placed on their trial in the Queen's Bench at the Guildhall for 'unlawfully and wilfully conspiring' to 'cheat and defraud' certain prosecutors of large sums. The trial lasted for nine days, ending in an acquittal.

Ît has long been an article of faith amongst business men that financial panics, like comets or eclipses, occur at regular intervals; decennial periods are the popular idea. The first authoritative account of a panic is given in 1745. The Stuart Pretender was advancing south, and had reached Derby, one hundred and twenty miles from London. The news arrived on Friday, the first

veritable 'Black Friday.' Alarm and confusion reigned supreme for a time. The king placed his valuables on board a yacht near the Tower. The run on the Bank of England was so great and urgent that the directors adopted the stratagem of employing confidential persons to present notes for payment, which the tellers paid in sixpences, and those who received the money returned by other doors and paid in their heaps of sixpences. The time thus gained prevented many genuine holders of notes from getting near the counters.

A meeting was held at Garraway's Coffee-House, and a resolution passed, and subsequently signed by eleven hundred fund holders and merchants, pledging themselves to accept Bank notes in payment of debts due to them. This allayed the

In 1793 the outbreak of war with France caused numerous failures of country banks and merchants. Mr Pitt promptly proposed an advance on Exchequer bills. About £2,250,000 were issued, and confidence was restored. In this year five-pound notes were first introduced.

In 1811 wild speculation, chiefly in exports, occasioned severe depression and panic. The shipments were so reckless that it is stated one overenterprising manufacturer consigned a quantity of skates to Jamaica. Parliament eventually stepped in, and authorised an advance of £6,000,000 to those who could offer satisfactory security.

In December 1825 the Bank of England was caught napping in a somewhat unforeseen panic. They had £20,000,000 of their notes in circulation, while the coin to meet them only amounted to little over £1,000,000. Mr Harman, one of the Bank directors, stated in his evidence before a House of Commons Committee that the Bank was saved from disaster by the accidental discovery of a large box of forgotten one-pound notes; these were paid out in place of bullion. The Governor of the Bank ascribed the chief cause of the panic to the reduction of interest on Government securities, in the same way that Goschen's Consols liberated enormous sums, subsequently reinvested in mining shares or other less hazardous enterprises.

The railway mania of 1845 assumed such prodigious proportions that by September of that year Parliament had sanctioned six hundred lines, with proposed capital amounting to £400,000,000. The inevitable crash came in 1847. The Bank of England obtained Government sanction to exceed their note-issue, but Lord John Russell stipulated that the public should receive any extra profit the directors made.

In 1857 events combined to produce a severe panic. The sepoy mutiny gave a disastrous blow to Eastern credit, while in the West reckless overtrading by American and Canadian houses occasioned serious losses to bankers and merchants in Liverpool and Glasgow. The Liverpool Borugh Bank, the Western Bank of Scotland, and the City of Glasgow Bank closed their doors. Dennistoun

and Company of Liverpool failed for £2,000,000, and the discount house of Sanderson & Company, London, for £5,000,000. On one day, the 12th November of that year, the Bank of England discounted £2,375,000, and owed to bankers £5,458,000, with a cash reserve of only £580,751. The Government again saved the position by intervention and a promise to the Bank to support a Bill of indemnity if they contravened the Bank Charter Act.

In 1875 there was a great collapse of foreign loans. This need occasion no surprise when it is stated that in ten years, the interval between 1862—1872, four wars cost the respective countries engaged an aggregate sum of £940,000,000.

The year 1875 should be remembered by patriotic Britons as a very profitable one politically and

financially. It was in this year that Mr Disraeli resolved to purchase one hundred and seventy-six thousand six hundred and two shares of £20 each for £4,000,000 from the Khedive of Egypt, now at least eight times the value.

Space will not permit any allusion to the City of Glasgow Bank crisis of 1878, the Consols conversion by Mr Goschen in 1888 and its consequences, the Baring and Argentine collapse of 1890. These are within the memory of many of our readers. The subject is of keen interest to men of affairs and all engaged in commercial pursuits.

It is probable we have seen the last of great financial panics in this country. Periods of inflation and depression are normal, but cosmopolitan finance is a mighty barrier to sudden and hysterical

PEAR-SHAPED STARS.

By Alexander W. Roberts, B.Sc.

BOUT three years ago I spent an hour with a party of children telling them, as simply as I could, some of the many wonders of our beautiful sky. Among other things, I assured

them that all the stars we see are not round like the sun or the moon or the earth, but that a few are shaped like a pear or an egg. These stars we call pear-shaped stars.

My audience, after the manner of little ones, said nothing; but their faces clearly revealed their thoughts. They knew that all the stars were round balls of fire, and from that hour, I am afraid, my reputation in their eyes as an exact and truthful astronomer was gone, although no doubt it was enhanced as a teller of strange tales.

Now, the attitude of mind of my young audience is not a singular one. We all carry through life, as kind of mental environment, a whole stock of conventional ideas about Nature and her manifestations. Ask any ten men what is the shape of every star that shines in the brow of night, and nine out of the ten will at once reply, with all the assurance of settled conviction, 'Round like a globe.' And thus it happens that when the mathematician or the astronomer reveals to our knowledge the existence of such strange stellar forms as egg-shaped, pear-shaped, or even cigar-shaped stars, our mind rises against such apparently deformed orbs in a kind of revolt. Like children of a larger growth, we say to ourselves, 'I thow that the stars must be as round as a billiardball; if it does happen that there exist somewhere in the great reaches of space stars shaped like a pear or an egg, then these bodies must be stellar freaks, ports in the well-ordered economy of Nature. They have little, and can have little, in common with such spheres of light as Sirius, Canopus, or

Thus do we reason unreasonably, for a pear-shaped star is neither a freak nor a monstrosity; and, instead of such bodies having nothing in common with the more highly developed suns that shine in our sky as stars, they represent the first stage in the evolution of those systems, stellar and solar, that impress all minds by their grandeur and majesty. A pear-shaped star is, indeed, a kind of celestial ugly duckling; one day its strange, lopsided figure will give place to a stellar system, perfect in its form, harmonious in its movements. Our own sun, for instance, now a star in the fullness of its beneficent manhood, with all its grown-up family of planets and moons clustering round it, a perfect sphere of life-giving flame, was, ages ago, in all probability a pear-shaped mass of chill, nebulous matter, a vast, kite-shaped figure, shedding worlds -Neptune, Uranus, Saturn, Jupiter, Mars, the Earth, Venus, and Mercury, as it contracted, and still contracted, through untold flights of time.

It is thus that Nature always works. There is no stagnation, no fixity of type, in her ample dominions. Whether it is the great majestic worlds that fill the night with beauty and splendour, or the myriad grains of sand that give a silver girdle to many a sea, each and all come under the despotism of the same inflexible laws of development as regards form and structure and movement. The form of each stellar orb and orbit, the shape and position of each grain of sand, are ever changing, 'ever giving place to new,' under the stress and strain of compelling circumstances.

What is a central sun to-day, a perfect ball of fire and flame, must ages ago have been a lop-sided mass of cosmic dust, a bulging, nebulous cloud, slowly revolving and yet more slowly contracting. A pear-shaped star, instead of being an anomaly, is therefore a link, one of the first links, in the great chain of events that connect the present time in our world's history with that far-off day in the beginning of things when our 'good green earth' was without form and void, and darkness covered the yet unborn world in its generous folds.

But to come to the heart of our subject: what actual proof have we that pear-shaped stars do exist? The theoretical reasons for their existence are many and unchallenged. Years ago such mathematicians as Darwin and Poinedre, with the spirit of prophecy upon them, delineated the form and fixed the place in cosmic history of such stars. Theirs was one of the 'visions splendid' of astronomy; but has the vision become one of the realities of practical science? Philosophy demands the existence of pearshaped stars as the material, the raw material, out of which stellar systems, binary and multiple, sirian and solar, are fashioned; but has any one seen them with his bodily eyes? The eyes of faith did truly discern them decades ago; but faith is not everything in science!

It is all very well to say that stellar evolution demands this form of star as the progenitor of more developed systems. The question that the ordinary man puts is: Have we seen such stars, measured their irregular form, estimated their oblateness, photographed their unfamiliar form? We must confess that no one has as yet done any of these things directly, for with the largest telescope in the world the brightest known pear-shaped star, Beta Lyræ, appears simply as a point of light. No stellar disc is visible, or indeed ever can be, as all the stars are too remote from earth for that to be possible. 'Then, how do you know, apart from theoretical considerations and proof, that Beta Lyrze, or any other star that shines in the sky, is pear-shaped if its outline has never been seen?' is a question I think I hear asked, and with some show of reason, for to many it may seem a strange thing to write an article on a phenomenon no one has ever actually seen. To such readers, the gulf between a conviction that some stars in the sky are probably pear-shaped, and the certainty, born of actual evidence, that this, and this, and this star is pear-shaped, is as wide as that between a dream and a reality.

Now, let me try to explain how astronomers are able to say that this, and this, and this particular star is pear-shaped; and how they are further able to measure, roughly no doubt, the flattened figure of these stars. In 1905 the scientific world was deeply interested in an important total eclipse of the sun which took place in Spain. Men travelled over continents and seas to observe it. They knew the exact hour when it would happen. For years before its occurrence astronomers had calculated, with almost perfect precision, the moment when the eclipse would begin at any given spot, how the obscuration would increase, when it would be total, and how and when and where the dark shadow would disappear from off the sun's face.

Now, all these calculations were based on the assumption that the sun and moon are practically

spheres-a true assumption. If they are not spheres, and if the calculations were founded on the assumption that they are, then there would be important discrepancies between the times of eclipse as theory predicted them and actual observation noted them. To put the matter still more plainly: suppose that the moon is of the shape of an egg and the sun of the form of a pear, it will be at once evident that the manner, duration, and date of eclipse will be somewhat different under these conditions from what they would be if the sun and moon were spheres. Thus, since the discs of both bodies are considerably elongated, the duration of eclipse will be correspondingly lengthened. There will also be a pertinent difference in the character of the eclipse. The sun and moon being no longer spherical, there would be a distinct want of symmetry between the decreasing and increasing phases. Indeed, there would be a hundred and one such differences, all due to and depending on the peculiar form of the eclipsing stars. But just as astronomers are able to tell us all about an eclipse on the assumption that the eclipsing bodies are perfect spheres, so could they tell all about an eclipse, its duration, its extent, its character, if the bodies were of any other shape. The calculations would be a little more troublesome, but they would not be unsurmountable.

Now, let us turn our eclipse problem the other way about. Let us suppose an astronomer who does not know the shape of the sun or the moon to observe a solar eclipse. He watches its beginning, the time and place; with a photometer he measures the steady decrease in brightness of the sun, he notes the time of each observation, he determines the moment of greatest darkness; he carefully measures the decrease of eclipse, its rate, its duration, its character; finally, he determines the whole brightness of the uneclipsed sun. When our astronomer has marshalled all his observations he has the data necessary for a fairly accurate determination of the shape of the sun and moon. He does not require to look at these bodies, or to measure them, or to photograph them. His eclipse observations give him all the information he wants. When he has dealt with his figures and facts he can tell us whether our satellite is circular, elliptical, or oval with as much certainty as if he had placed it between gauging-rods.

It is in this reversed form—namely, to find the shape of two eclipsing bodies from the circumstances of their eclipse—that the problem presents itself to those who follow out the search for pear-shaped stars.

We have in certain articles already published in this Journal written concerning stars that vary regularly in brightness, because their light is eclipsed by a circling companion. Such stars are called Algol variables, and they wax and wane in brightness after the fashion of the winking eye of a lighthouse. Now, although the ebb and flow of light of an Algol star seems very different from the majestic wave of night that sweeps swiftly across

the sun's face during a solar eclipse, it is a difference in intensity and range, not in kind and character. The sun is near us; the stars are infinitely remote. When we witness, therefore, the fluctuations in brightness, the steady waning and waxing of light of an Algol variable star, we know that we are simply watching a solar eclipse away out in the far land of stellar distances; and the same geometrical laws of sunlight and shadow govern both eclipsesthose of our sun, those of an Algol variable star. If the obscuring body is spherical, the eclipse will take place in a given definite manner; if the obscuring body is not spherical, then there will be a distinct departure from the regular symmetrical eclipse which takes place under the former conditions—that is, if we have observed carefully a stellar elipse we are in a position to tell the shape of the eclipsing stars, and our conclusions will be as assured as if we examined, measured, or photographed the occulting discs.

When, therefore, a star has been observed to vary in brightness in such a manner as to indicate that it is an eclipse or Algol variable star, a watch is kept over all the vagaries of its variation in order to arrive at a determination regarding the shape of the star. The observer determines the instant when the star begins to decrease in brightnessthat is, he observes the beginning of eclipse; he measures with all possible accuracy the decrease in brightness, its rate and duration; he fixes the instant of greatest eclipse; he compares the increasing phase with the decreasing, in order to detect any want of correspondence between the two; finally, he estimates the amount of brightness of the star when uneclipsed. All these facts ascertained, he is in possession of definite knowledge regarding the shape of the eclipsing stars. He is in possession of a good deal else besides this, but one concern at a time must satisfy us.

Up to the present the researches of astronomers in the direction we are now considering have been to reveal the existence of ten pear-shaped stars, five in the northern and five in the southern hemisphere. This may seem a very meagre harvest to those who are unacquainted with the difficulties that attend the search for such stars. To those who do know and understand the difficulties, the discoveries already made would seem to indicate that the number of pear-shaped stars in the universe is much greater than one is inclined to allow. Yet, that a not inconsiderable portion of the material universe should be in the morning of its long, long day is not surprising, surely. The ten stars discovered represent all degrees of oblateness, from bolies almost as elongated as a torpedo to orbs nearly spherical in form.

Of the ten stars, or rather systems, two are of special interest. In the case of these two systems the component stars are so near one another that they touch, and at the point of contact they merge into each other. It is very difficult, therefore, to say what exactly is the shape of these figure-of-

eight stars. Such a system must be in a state of the most unstable equilibrium; and one day the centrifugal force will prove too strong for the slender, ever-changing nexus that binds the twin companions together. In that day snap will go the connecting link. When this takes place there will be for both stars a period of stupendous unrest. From centre to circumference the vast bodies will oscillate in great swelling pulsations, gradually dying down to a sobbing dispeace. Thus are worlds born!

Two important facts emerge from a closer study of our ten pear-shaped stars. First, the nearer two companions of a system are to one another the more oval are they in form; second, there is distinct evidence, in the case of at least two of the ten systems, that the component stars are slowly receding from one another.

An acquaintance with the laws of gravitational physics would lead us to expect the first of these conclusions; for the power of any body to distort or to raise tides upon another body depends on the distance the two are apart. We have in our own tides a striking example of the force which a small body exerts upon its primary, even when that pull is considerably weakened by the long distance over which it has to travel. Under the compelling stress of the moon's attraction, as we all know, a great swell of waters, in rhythmic surge, sweeps round the globe, bringing to estuary and harbour, river-mouth and landlocked bay, the rise and fall of the cleansing, purifying sea. What would the gigantic strength of the moon's tide-raising force be if it were fifty times nearer our earth than it is? In that case its irresistible pull would pile the waters of ocean into a tide sixty miles high; the terrific lateral strain would crack the rocky ribs of earth as a man cracks a walnut. With a moon circling at our very doors the earth would no longer be an orange-shaped globe; it would be a pearshaped world. But what a world: air and sea and shore reverberating with the thunder of creaking, grinding rocks, and the wash and boom of great tidal waves-a dead world!

The second fact also follows naturally from a well-known law of stellar dynamics. The law is this: if two bodies are near enough to raise tides on either of them, this very expenditure of tideraising energy shoves the circling bodies farther and farther apart in an ever-widening spiral. The forces, therefore, which tend to bind two stars together—namely, their attraction—are in reality the means of their separation and disunion. The reflex action of the tides is to gradually weaken the power to raise them. Thus does Nature most harmoniously work out her great schemes for the evolution of worlds and systems of worlds.

Given the operation of these two great laws, it is easy, I think, to predict what the future history of a pear-shaped system will be. We can trace its development from the moment of its birth as a dual unity right on to the day when, after much travail,

it has become a system of worlds where life is possible and probable. The fissiparous principlewhich seems as inherent in matter as it is in the lower orders of animals, and of which the pearshaped form is the outcome-compels the rotating, tenuous, unstable mass to shed at vast intervals its brood of infant worlds. But this disintegration does not go on for ever; another, and a third, law supervenes to prevent practical annihilation, or else the universe would become an aggregation of infinitesimal grains of matter, finally dissolving into space and leaving 'not a wrack behind.' The conserving and preserving law to which we refer is that which compels a gaseous body to go on contracting until at last its density is so great that further contraction is impossible. When this end is reached disintegration ceases.

Now, if we are thus able to look down the endless corridors of time, and to witness the slow evolution of ordered systems from a primeval egg-shaped mass of world-stuff, what is to hinder us from looking backwards over the way we have travelled? May we not retrace our steps until we reach that natal day when our earth rose into being as a gaseous wart on the misty folds of a nebulous sun? But if this way be too far for even the keenest vision, we may follow with sure sight the lifestory of our planet back to the hour of the moon's birth.

We have already stated in this article that theory demands for the genesis of our satellite a Siamese-twin, pear-shaped, earth-born system; and we have seen that analogy supports the demand. Now, there are those who, perhaps overventure-some, point to the very spot where our satellite broke away from its mother-earth. They tell us that over the spot where the Pacific Ocean now rolls in long silver waterbreaks, the moon gathered to itself a separate existence, and that under the surface of this spacious stretch of sea, full three thousand fathoms deep, may still be found the scars which mark the place where a world was born.

When was this birthday? In the beginning of things is about the most satisfactory answer we can give. But if we wish to place some reasonable span between that vague 'beginning of things' and the present day, we may state, yet with some hesitation, and with no small uncertainty, that at the very least one hundred million years measure the moon's age as a separate world.

A burnt-out cinder, a dead world, a desolate land of fierce extremes of heat and cold, are the names we hurl at the friend that has companioned our earth for over a hundred million years. If it is dead, a dried-up cinder, a furnace and an iceberg by turns, it has had its day of good things. It was once so near the earth that it modelled its mountains and seas; but as the years came and went it drifted farther and farther away, till at last a heave of the ocean in greeting is all earth has to give to its eldest born.

What the future of our own planet may be does not concern us here; an excursion into such a field of inquiry does not fall within the area of an article on pear-shaped stars; but the question is certainly of interest, and I hope at a future opportunity to indicate what answer science has to give to it.

Now we return to the point from which we started, and we have to modify a certain thought expressed in the opening paragraphs of our article. After all, a spheroidal world bears the last touches of Nature's kindly formative hand. A round globe is the finished product of many evolutions; and if our minds have grown instinctively abhorrent of pear-shaped stars, it is because life as we know it on such tide-distressed worlds is an utter impossibility. Their substance is as diaphanous as a summer cloud; in the space of a few hours their huge bulk, sometimes as much as three hundred million miles in diameter, contracts and expands through a range of over a million miles. Storm and strain are the spirits that brood over their vast, tumultuous, shoreless wastes; there is ever the clash of atoms and the surge of sorely tossed titanic waves. Majestic in their spaciousness, impressive in their stupendous movements, their importance, their human attractiveness, lies in their potentiality, in their promise. They are worlds in the making.

THE SHIP OF YOUTH.

A SHIP steered slow to my port of dream, With spectral rig and a phantom beam; She bore the freight of my broken years, My springtime loves, and my ancient fears; She sailed on the waves of my past-ahed tears.

He at the prow seemed a swrivelled youth Who lisped the words of a ravished truth; He at the helm fast babbled a creed In the heart of which was barren seed, And the flowers of his cheek were gray as weed.

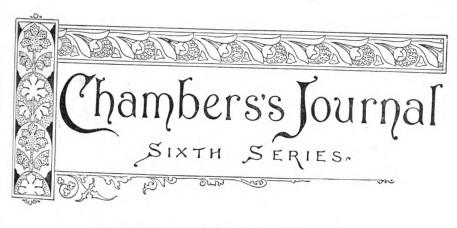

The tattered rag was a flag of hope Lashed to the mast with ambition's rope; She'd ploughed her way through a trough of cares, Was wrecked on a sea of frozen prayers, And was swept to the shallows unawares.

And though bleached, barnacled, staved, and gray, With squeaking blocks and a crumbled stay, She spoke of years when her keel was clean, Her sails ran full, and her prow glanced keen, And her paint, like grass in the spring, was green.

The notes in the log of that battered craft, Torn, splintered, and riddled fore and aft, Betrayed the tale of my ancient pride, My fervent faith for the fullest tide, Of a hope that failed, and a trust that lied.

She lay like a wraith, with her slatting sails, And her shrivelled cargo of scheme-packed bales; And my heart yearned strong as it did of yore To sail to a land with a golden shore I had known of old and should know no more.

A. STODART WALKER-

GERMANY OF TO-DAY.

A SNAPSHOT.

By Mrs ALEC TWEEDIE.

HE Kaiser has won!

It has been a battle-royal, a battle between an Emperor and his people. Germany is going through a great political crisis, and that crisis is by

no means ended by the election of a new Reichstag. It so chanced that I was in Berlin when the 'colonial scandals' were being discussed in Parliament. A few days later those scandals caused the dissolution of the Government.

With one election just over—the most stormy the country has ever known—and every prospect of another at no distant date, one wonders what is to be the end of the political war.

Hearing that the sitting on that particularly wintry afternoon would be interesting-the House sits from one o'clock to seven—a friend offered to escort me thither. He sent in his card to one of the Ministers. A few moments later the greatest excitement known for over twenty years startled the Reichstag. We entered by the famous 'Portal Zwei, a door through which, in his days of power, Bismarck had so often passed. Up the red-carpeted stairs we mounted, through handsome rooms with Pictures on their walls, beneath which Ministers sit to chat over important political affairs. At the head of the large hall stands a marble statue of the great Prince who led his country through war to peace, and planted the seeds—tiny seeds then from which in less than forty years has grown such

For a moment let us take a peep at the Reichstag itself. It is a handsome modern structure; but then nearly everything in Berlin is new, except the old Schloss and a handful of public buildings. The greater part of Berlin as it stands to-day was conceived after the close of the Franco-German war; and this vast, wealthy, modern business town is one of the signs of the evolution of Germany. In all three hundred and ninety-seven members sit in the

Reichstag. Of these, Prussia returns two hundred

and thirty-six, Bavaria forty-eight, Saxony twentythree, Würtemberg seventeen, Alsace-Lorraine fifteen; the Gross-Herzogthümer, Herzogthümer, and Fürstenthum return members varying in number from one to fourteen; Lübeck and Bremen are represented by one only; while Hamburg sends three.

From above, a huge glass roof lets in the light of day upon the scene, while electric lights filter through this glass dome in the hours of night. Each member has his own desk and seat, as in the Capitol at Washington. They fill the body of the hall. Behind are galleries for the public, and here men and women alike find seats as listeners. Women are not hidden behind a grille as in the British House of Commons, but are treated like ordinary human beings, allowed fresh air and light, and given the possibility of both hearing and seeing. In front of the members' benches is a long, high dais, on which the Bundesrath sit facing the House. The Bundesrath is representative of the different States which form the Empire. The members are nominated by the Sovereign of their respective States, and retain their position at their Sovereign's will. In a House so constituted the now famous 'row' took place.

I was partly educated in Germany, living for nearly a year with Herr Geheimrath Professor Carl Thiersch, the famous surgeon in Leipzig, whose wife was the daughter of one of the most renowned chemists of all times, Baron Justus von Liebig. Liebig was my godfather. More than that, my father, Dr George Harley, F.R.S., was a student in Heidelberg and Giessen, and a friend of Helmholtz, Kölliker, Bunsen, Carrière, Ludwig, Virchow, and other great German thinkers. My mother lived as a girl with Baron and Baroness Justus von Liebig in Munich, where she met every one of note in the great Bavarian capital. My whole life, therefore, has been sympathetic to Germany, where my father's APRIL 13, 1907.

[All Rights Reserved.]

books and my own have been translated. Thus my poignant regret when misunderstandings prevail between that great country and our own will be understood.

Two or three facts have been established at the recent election. The Social Democrats have momentarily lost power; but with the decline of Socialism in Germany, another and perhaps a stronger factor has risen in religious guise.

The Kaiser's present position demands that he shall work with the great Catholic party—the famous Centrum—or he will be in peril. The Pope saved the situation. Naturally, the Vatican took the side of the Government in Germany. They could not afford to do otherwise, with their great political struggle going on in France.

The Kaiser still holds the reins of government, even if the Catholic steed he is riding proves a little restive. People must, however, remember there are two bits in that animal's mouth, a curb and a snaffle. One is called Conservative and the other Liberal. In the meantime, the steed known as the German Government and its ally Catholicism are ambling steadily, the Kaiser holding the ribbons. Once the horse begins to pull, to jib, or buck, then comes the moment of trial. If the Conservatives and Liberals don't work together, over goes the whole bag of tricks, the rider will be dismounted, and another appeal to the people will be necessary.

The position of the German Government is by no means secure. It has to rely on a very small majority, which may at any moment be withdrawn by Rome. Britain, being a Protestant country, will watch this position with interest.

The present Reichstag contains twenty-two different political parties. Some have only one representative, it is true, but there are twenty-two different forces to deal with. That in itself is no easy task. There are four strong parties: the Catholic Church under orders from the Vatican, the Conservative and Liberal politicians, and the Social Democrats or labour representatives. That horse will take a deal of riding, and it will require all the Emperor's tact to keep him in the saddle at all.

Another lesson this election has vouchsafed—namely, the people of Germany take a much greater interest in politics than formerly. The Kaiser appealed to every one to vote, and the result was surprising. About 75 per cent. of the voters formerly rallied to the poll; but that number was augmented to something like 90 per cent. at this election. Another sign of the awakening of the Fatherland; another token of the interest of the people in public affairs.

Peace and prosperity have reigned in Germany for thirty-six years—not a long time in the making of history; but that period, brief though it is, has done much for the development of the nation. Centuries of war and minor disturbances ended in 1870, when the German Empire was born. The States federated themselves under a constitution in 1871, when the executive power, within certain

limits, was given to the Emperor. Universal suffrage was created, and the Federal Council and Reichstag came into being. The people laid aside the sword. Gradually they drifted from the agricultural districts to the towns, as one manufactory after another was opened, and to-day modern Germany has become one of the great producers of the world. A country hitherto poor has amassed wealth; occupation has been found for the men, more leisure for the women. Modern Germany is the product of human industry.

For thirty-six years Germany has experienced the working of a Constitution. The actual cause of the late crisis was the sending out of a few thousand troops to the German colonies in South-West Africa; but much else lies behind, and possibly in this country it is not sufficiently realised to how great an extent Ultramontanism is mixed up with the question. It must be understood that Germany is about one-third Catholic and two-thirds Protestant. For instance, the Rhineland is almost wholly Catholic.

The powerful Centrum (Catholic) party originated after the war of 1870, when it found an able leader in Windhorst. The statesman who ruled at that time was a strong opponent of the doctrine of papal infallibility. As is well known, this doctrine only applies to questions of creed. The Pope only claims to be infallible when he speaks ex cathedrû. But Bismarck maintained that in politics the distinction is practically valueless, as the Pope has the right to decide how far the idea of 'creed' shall go. As an instance, the Catholic Church has always claimed the right to control the education of the people, and the doctrine of infallibility enables the Pope to exercise his power over the schools. Bismarck shared the opinion of Napoleon I. that he who has control of the school has the future of the country in his keeping. He thought it imperative to exclude the Church from the school, and therefore passed a law in 1872 by which the inspection of schools was taken from the Church and put entirely in the hands of the civil power. This was the beginning of the struggle between Rome and the Prussian Government. In a famous speech Bismarck dramatically declared that 'the Empire will have one enemy for ever, and that enemy will be the Jesuits.' What would he have said to the alliance of the Government and Catholics to-day?

This internal religious war is not all.

Everywhere one turns in Germany one hears of the Social Democratic party; they are the great and growing factor to be reckoned with. Despite this brave display, the number of revolutionary Socialists in Germany is probably not very great. If it came to the point, it is doubtful whether many of them would vote to abolish private property or wish the production of manufactures regulated by the State. That, at least, is the belief of many who know the German workman well, with his underlying patriotism, his thrift, and

his love of order. The out-and-out Socialists of Germany are probably about as numerous and influential in relation to Germany as the Jacobins and Communists were in France a hundred years ago. Taine has shown that the number of real Jacobins was small; but they were supported by many who were discontented with the then existing state of things, until Napoleon Bonaparte saved France from a reign of terrorism. The strength of the Socialistic party in Germany to-day lies, as it did in France one hundred years ago, in the discontent of the labouring classes, who do not want Socialism so much as shorter hours of labour, a greater share in the profits of industry, better treatment, and more consideration from their employers.

An opportunity came with these colonial scandals for the Centrum joining forces with the Social Democrats to overthrow the Government. Prince Bilow, as Imperial Chancellor, had tried for years to compromise, angling continually for the Catholic vote. It was, therefore, expected that he would again adhere to this policy. But at last the Prince realised that further submission would end by the entire subjection of the Government to a religious party, and he himself threw down the gauntlet. It is, therefore, remarkable that this very Catholic party should have helped to put the Government back in office, and is ready to work with and for the Kaiser!

It was the first time since the days of Bismarck's Ministry that a member of the Government had dared to attack the Centrum in such an uncompromising manner. Herr Dernburg is neither a great orator nor a political genius; but he spoke to the point, and his words appeared to have great weight with the listening House, as I watched him from the Ministers' Gallery. Dernburg was a lanker, and is said to be, like Beaconsfield, of Jewish descent. He has the reputation of being a clever financier, for which reason he was chosen for such an important appointment. Like Lord Byron, he might say, 'I awoke one morning and found myself famous.' He must be amazed at his own prominence in Germany to-day, and tomorrow he may find himself Prime Minister—who

Among the intellectual class in Germany—the mental aristocracy, so to speak—there is no ill-feeling towards England; and, after all, these are really the thinkers and writers of the country. The science of both countries has been closely related since the days when Harvey, the founder of Modern Physiology, published his book at Frankfort. A disciple of Newton was made President of the Berlin Academy of Science by Frederick the Great. Darwin had no truer disciple than Haeckel in Jena. England has shown the same broadmindedness with regard to Germans.

It was curious, however, occasionally to hear Germans talk of possible war with England, a talk which is heard only amongst men engaged in

commerce and industry; to hear their indignation at our good understanding with France, which some of them look upon as a personal slight to themselves, or of our position towards them over Morocco. Anglophobia in Germany is no chimera. It is real; less than at the time of the Transvaal war, it is true—a war they so roundly abused, and now they themselves are having grave troubles in their own colonies. This Anglophobia is very sad. It probably originates from envy; but its origin is of less importance than its cure. Business people think we are rivals.

Well, rivalry is healthy; it stimulates and achieves; but rivalry which amounts to bitterness retards and destroys. This rivalry, this warlike feeling, only seems to exist, however, among the merchant class; one hears nothing of it from ministers, politicians, or university people, all of whom have a wider horizon.

War between England and Germany is surely impossible. They are the only two great Protestant countries of Europe; one might say they are the two most important countries of Europe, and their strength is only equalled by America and Japan. Their most vital interest is to keep peace. How would it be possible for these two great European Powers to go to war? Who would be the gainer? War would immediately become international Europe would become the battlefield of the world. War makes good newspaper 'copy,' but no rational being seriously thinks of such a possibility.

The German Government has no direct supporters among the Press. More than that, German Ministers do not owe their existence to political parties, and cannot, therefore, rely upon any party Press for implicit support. With but rare exceptions, only members of the Conservative party, at least in Prussia, are appointed as Ministers, and it is not unknown for them to quarrel with their own following. Ministers in Germany do not change with the changing verdicts at the polls; they hold their offices at the will of the Kaiser, and have very little personal contact with the people. Antagonism on economic questions has repeatedly arisen during the last few years between the Government and their habitual supporters.

When, a few years ago, the Prussian Ministry brought in a Bill relating to the construction of canals in the western provinces, it met with unanimous opposition from the Conservative party in the Lower House of the Prussian Diet; and the ministerial policy with regard to the treaties of commerce has repeatedly been combated by the Conservative majority. In such cases the Conservative Press has gone against the Government. There is, therefore, no portion of the Press upon which the Government can count as an absolutely trustworthy ally.

In England the conditions are entirely different. A party paper follows and upholds its chiefs through thick and thin; but such a state of affairs does not exist in Germany. With ourselves, the ship of State is always under the guidance of one or other

of the great political parties, whose Press gives voluntary support to the Government without waiting to be asked. There is, therefore, no need to exercise any influence. For such political services the owner or editor may in due time receive a title; he may become a baronet, or if his wealth and influence have been strong enough, he is made a Peer. In England a Liberal or Conservative Government has in the Liberal or Conservative Press a natural and trusty ally, whose business it is to give the most widespread publicity to its views.

There being no such voluntary system in Germany, it would surely be asking too much of the Government to demand that it should refrain from having any connection with the Press, which, after all, exercises the greatest influence upon public opinion. Comparatively few individuals have the necessary acquaintance with the details of public life and political affairs, the education, or the power of judgment to enable them to form an independent opinion on matters relating to politics. The vast majority of mankind obtain their knowledge and their opinions from the particular newspaper they are in the habit of reading. This becomes rather amusing sometimes when a man has read his own party's views so often that he has no idea there is another side to the question at all.

British Ministers have a further advantage over their German colleagues. Popular celebrations of every kind, openings of museums, galleries, public parks, political meetings, or Lord Mayor's banquets, give occasion for them to address the public. They thus secure frequent opportunities to speak directly to the people, and are able to defend or oppose political principles. Every Englishman who takes any interest in politics reads, for instance, the speeches made by Ministers at the Guildhall or at the great political gatherings in the constituencies. In Germany, on the other hand, this valuable mode of influencing public opinion is almost unknown. This makes the position of the Government more difficult, inasmuch as the ideas and aims by which it is moved are less in evidence.

Englishmen, like Americans, appear to be greater orators than Germans. The Anglo-Saxon race make shorter, more emphatic, and more impressive speeches. Perhaps this is largely due to the language; ours is simpler in construction and clearer in its mode of expression than German. As Mark Twain pointed out in his delightful rigmarole on the Teutonic tongue, Germans take pleasure in long and hopelessly involved sentences, and one almost forgets the pith of the story while waiting for the verb to arrive at the end! Possibly, also, the philosophic trend of the Teutonic mind does not lend itself so readily to vocal expression as our more practical way of thinking.

It is a common notion in England, and in some quarters in Germany, that Prince Bismarck exercised an enormous influence on the German Press. This reproach, one of old standing, was doubtless

emphasised by the well-known book on the first Chancellor of the German Empire by Moritz Busch. Having heard this theory so often advanced as the origin of the supposed control of the German Press by the Government even to-day, I was naturally anxious to learn something from authentic sources. During my last visit to Berlin I had the opportunity of talking to many persons intimately connected with the Bismarckian era, from whom I gathered that the Prince had undoubtedly a very high opinion of the power of the Press. At the beginning of his political life, in the late forties of last century, he wrote numberless articles for the Kreuz Zeitung, at that time the mouthpiece of the Conservative party. But I am assured by one who certainly ought to know that he never made use of the Press in any way for party gain either by his influence or by bribery.

Two wealthy merchants in Hamburg who had the greatest admiration for the Chancellor were at that time the proprietors of the Norddeutsche Allgemeine Zeitung. Of their own free-will apparently, they offered to place their newspaper at his disposal. In the Reichstag Bismarck repeatedly laid stress on the fact that his only connection with the Press was the blank sheet which that journal always kept at his disposal. It was an open secret that by this means Bismarck communicated with the people. Sometimes he seems to have written articles himself, but more often to have given notes to his secretaries to elaborate.

Despite all that has been said and written about the 'reptile Press,' Bismarck appears to have had really but little control over the German newspapers of his time; and, in fact, the long-prevailing ideas of his interference with it seem to have been as grossly exaggerated as is that of the German Government at the present day. On both sides of the Channel the Press is frequently held responsible for that undercurrent of ill-feeling between England and Germany which one must candidly admit is not yet entirely removed.

Turning from the Press, we must remember that Germany for years enjoyed the admiration of Europe for her progressive development in science and art. A grand period of philosophy began with Kant, Fichte, Hegel, and Schelling, while Goethe took front rank as a poet. In music, Mozart and Beethoven were unequalled. The nation did not shine in politics. Germany was called a land of poets and thinkers. In the second half of last century, however, under Bismarch, the country rapidly acquired political importance, followed by a wonderful economic development founded on sound education.

Modern Germany is very new. It strikes one as a strong, healthy child learning to walk, and not quite steady on its feet. It is throwing off old traditions and acquiring new customs. In many ways the Germans are in advance of Englishmen; in others, behind. In the education of men, in all technical education, they are far in advance

of us. The commercial travellers' knowledge of geography and languages beats us to shame; but as a rule that class have not the broad views or enterprising mind of the British. In music and science the Germans are very thorough. In the higher education of women they have still much to learn; but there is at this moment a tremendous movement towards feminine improvement in every way, and in a few years the world may be astounded at the result. It certainly looks as if they were to be a great power in the future. The Frauenfrage is the opening of a new era in the Fatherland. Women may help to unravel a very knotted skein.

There is a passage of singular interest in the Hohenlohe Memoirs, recently published, inasmuch as, dating back as far as 1848, it shows that Germany was then confronted with the same problem that is before her to-day: 'Since the House of Hohenzollern first stepped forward as Electoral Princes and Sovereigns they have been marked out as the defenders of Protestantism in Germany. . . . The real peril lies not in the parties of the Communists, Socialists, and Radicals, who have existed in every State and in all ages; not in the secret machinations of the Jesuit Fathers and their friends, who represent the stunting of the minds of the people as the only salvation, the sole anchor of safety; but in the fact that the discontent, of which each party makes such skilful use, is so universal and so well founded. . . . The nation demands a share in public administration now as never before. . . . It is a mistake to try to dam the tide of revolution by liberal reforms in individual States without reforming Germany as a whole. The Free Press is a necessity; progress is a condition of the existence of States. . . . It is a lamentable illusion with many well-meaning statesmen to regard progress under the existing conditions of Germany as something quite innocuous. Progress leads to revolution. A hard saying, but a true one!'

In the dawn of 1907 Germany is outwardly more prosperous than she has ever been in history. She is richer; her people are better employed; she holds a stronger position in the face of the world; she is expanding her new colonies, increasing her navy, and maintaining her army. But a riddle lies before her. How is this internal crisis, this political discontent, this mistrust of the Government, to be restrained; in what direction is it to be allowed to run, and how far may concessions be made, and yet the integrity of the German Empire be retained?

Even those men in the forefront of German political life are doubtful what turn the evolution of politics will now take, and I shall not myself venture on the perilous path of anticipation.

Germany, after all, is not alone in this political crisis, although at the moment her position is more acute. All the Great Powers of Europe are passing through somewhat similar ordeals. In Russia rich and poor are at war, the autocracy trembles; in France Church and State are at defiance; while in England who is to say where the present House of Commons and its democratic tendencies, its Churchmen, its Nonconformists, and its Socialists may not lead us?

As a nation, we Britishers must realise that Germany is an undoubted world-force. She is forging ahead. She is rich and well organised. She has her nobility, her middle class, and her peasantry. Above all, she is ambitious. She has felt her feet, and she means to march forward. We are her friends—both chips of the old block, so to speak—and we should try to understand her, to sympathise with her, and help her in her aims, rather than present an antagonistic front and seek to retard her development. Two such forces, two such nations, working hand in hand can do much towards universal peace, the advancement of trade, and the betterment of mankind.

Let us shake hands and call Pax!

норру.

CHAPTER II.

'I heard him. You can't go, my boy; sorry as I am to have to refuse you.'

'But, colonel,' cried Hoppy, 'surely the General didn't mean that in a case like this a man was to be left outside? He's a hard chap, we know, but he never dreamed that there would be any wounded still alive. He's seen service before against ruffians of that kind, and knows their

devilish ways. It would be inhuman, too awful, to leave a chap out there even half-a-minute longer than was necessary—exposed to the chance of being spotted by some prowling nigger—just for the sake of red tape. Do, for God's sake, let me go!' he urged. 'I don't like to disobey orders exactly; but you can satisfy my conscientious scruples by giving me leave now, and then go off and find Ranger, and tell him about it—about Vare being outside, I mean. When you're gone I'll slip out and fetch him in, and I'll say nothing about you at all, colonel. If there's a row, I'll keep mum. I'll not give you away. Only just say I may go, and then, whatever

happens, my conscience will exonerate me from blame.'

Now, Colonel Morrison was one of those kindhearted, weak men who have no business in the army whatever, and yet, strange to say, they abound in it; they get themselves and their subordinates into endless scrapes through sheer inability either to accept responsibility or say 'No' to a persistent pleader. They are dear, good fellows as a rule, and popular enough in the piping times of peace; but when the serious business of their trade befalls they possess the confidence of neither officers nor men.

Thus Hoppy's earnest pleading, according as it did with his own feelings of humanity, produced the usual effect; and, instead of peremptorily telling the subaltern, who was a great favourite of his, that he could not be a party to any such scheme as Hoppy proposed, he jumped at the lad's insidious suggestion as a spleudid way out of the

difficulty.

'Very well,' he whispered, 'I'll give you permission to go, and I'll find Ranger and tell him about Vare; but it is understood, he added impressively, 'that this is only between ourselves and for your private scruples. I know nothing of your doings officially, mind you-absolutely nothing whatever; and if anything happens, or there is any row, I shall expect you to keep silent and remember that you acted entirely at your Indeed, I should deny all rememown risk. brance of this conversation if you hinted that I knew anything about it.' And the poor man got quite angry, and puffed with indignation at the bare thought of it ever becoming known that he had, once in his life, done something without orders from a superior.

'Word of honour, sir,' cried Hoppy joyously; 'I'm awfully grateful;' and then softly murmured, sotto voce, as his friend hurried away, 'Mirabelle, my darling, you may marry a V.C. yet if there are any niggers about. Not that I am doing it for that,' he hastily added, as he realised the meaning of his words. 'I hope it's for a nobler motive than that; and anyhow, if I succeed or if I fail, I run a jolly good chance of going before a court-

martial.'

Then he gave his orders. 'Sergeant of the guard,' he said, 'I am going to try to bring in Captain Vare. You will take charge of the gate during my absence, and on no account either leave it or allow any one else to do so-that is clear, eh?-under no circumstances whatever.

'Very good, sir.'

'Post your best shots on the wall to cover my retreat if necessary, and don't open the gate for me

until I am quite close to it.'

'Please, sir, may I come too?' asked Private Rex, stepping forward and saluting. He had been relieved by another man by this time, and had been standing close to Hoppy for some minutes unnoticed.

'Certainly not, Rex,' sharply answered the latter; but the man came close to him, and, in defiance of all the rules of military etiquette, whispered, 'I 'eard w'at the colonel said, sir. You oughter 'ave a 'and with this job; it won't per'aps be as heasy as it looks, sir. I wish you would. I hain't forgot that little matter you 'elped me hout of at 'ome, sir.'

95

'No, no, my good fellow. If I could take anybody, there's no one I'd sooner have than you. But it can't be done; and as to that little service I did you at Aldershot, if you are really grateful you can best show it by promising me not to say a word, whatever happens, of what you appear to have overheard pass between me and Colonel Morrison. Come, can I count upon your

silence ?' 'Ay, ay, sir, if you wish it,' dolefully replied the soldier; 'but I'll go hup top, with the sergeant's leave, in case of haccidents. I'm stiddy, yer know,

sir, an' best shot o' the battalion.'

Hoppy did not reply, but hastened to get rid of his sword and helmet, replacing the latter by a cap. He still retained his revolver; and this, with a small flask of brandy and a roll of bandaging, was all he considered necessary to burden himself with. He was a big fellow, and one of the strongest in the army, as he had proved time and again at many an athletic meeting; while Vare, on the contrary, was small and slight as a woman. But he felt that he had no light task before him should the latter not be in a condition to help himself; and that if by any unlucky chance he should be obliged to make a run for it with the man in his arms, every extra pound that he had to carry would tell in the race for home.

'Now, sergeant, open the gate,' he ordered; and with one long, comprehensive sweep of the glasses to see that the coast was clear of lurking foes, Hoppy started on his errand of mercy, and heard the great doors close ponderously behind him with

an ominous and suggestive bang.

'By Jove!' he muttered as he sped away, 'I don't care a rap for the niggers; but I hope those clanging gates aren't prophetic of my future, and mean that this little business is going to shut me out of the service for ever.' Strange foreboding! Could he have had a glimpse into the future would he

have turned back, I wonder?

Rapidly getting over the ground with long, easy strides, he made his way down the dreadful road until he came almost abreast of the spot where Vare was lying, averting his eyes as much as possible from the appalling sights that met them on every side, and then, striking across the loose sand of the plain, he speedily reached his man. He found him suffering from no more than a somewhat severe sword-cut over the head and face, the loss of blood from which, by happily rendering him unconscious, had saved him from death and mutilation at the hands of the barbarous enemy. He was by this time, however, rapidly coming to himself; and after he had swallowed the dose of brandy which Hoppy poured down his throat he promptly completed the operation. As he recognised his brother-officer the dazed expression which had followed the return of his senses gave place to a fierce scowl, and he made a determined but futile effort to rise to his feet unaided.

'Come, come, Vare!' cried Hoppy impatiently, 'this is neither the time nor place to show your feelings like this. You can't get along without my help; and if you think it would be pleasanter to lie out here until somebody comes along you like better than me—a prowling nigger perhaps—just cast your eyes over there to what remains of poor Vidal, and see what you may expect at his hand. Ah, I thought so,' he went on, as Vare, obeying the suggestion, uttered an exclamation of horror. 'And now I'll tie up that ugly gash in your head, and we'll make tracks for the gate, from which I have been absent too long, I expect, already.'

Vare maintained a stony silence. It was evident that hatred of his successful rival strongly urged him to reject his assistance. But, prudence and the gruesome sight which he had just seen winning the day, he sulkily submitted to the bandaging, and then, lifted to his feet by his powerful rescuer, he half-tottered, was half-carried by the latter's strong right arm on what was destined to prove before they had gone very far the most exciting quarter of a mile of their lives.

Vare's weakness being excessive, Hoppy deemed it the wiser course to make straight for the road rather than to strike it obliquely. This meant more ground to cover; but he felt that, with every probability of very soon having entirely to carry the wounded man, it would be better business to have hard ground under his feet than loose sand. The line he took, therefore, was directly towards the empty tomb which he had mentioned to Colonel Morrison as indicating, more or less roughly, about the distance out that Vare lay. It stood some way back on the other side of the road; and when the two men reached the latter, they, the tomb, and the city formed the points of an isosceles triangle, of which the gate was the apex.

'That's all right,' cheerily cried Hoppy, as he once more felt his feet take hold of something solid instead of the shifting, tiring sand. 'Now it's all plain sailing, Vare, and we'll get along easier. I'll take you on my back if you are done, and we shall be inside the gate in a brace of shakes.'

But even as he spoke he was startled to hear a shot ring out from the wall, followed by others in quick succession, until the firing became rapid and continuous. The cause of the outburst was immediately apparent; and Hoppy felt his heart sink into his boots as he realised that his companion's brandy-given strength had run out, and that in a few minutes he would no longer be able to put one foot before the other. Swarming from the old tomb, and spreading out fanwise as they ran, so as

to make certain of intercepting their prey, if they did not overtake them before they could reach the sheltering gate, were thirty or forty of the enemy, who had evidently been lying in this convenient hiding-place with a view, comfortably and unharassed by fire from the walls, to stripping the dead at their leisure when night should hide their movements. But the sight of two living infidelstwo keys to the gates of felicity for the lucky ones who could cut their throats—had proved too great a temptation for the skulking true believers, and out they had rushed helter-skelter, eager to win the prize. But 'champion shot' Rex and his friends, keen-eyed and alert, had discovered the very first of the swarthy warriors as he left the shelter of his lair; and, using the convenient parapet that topped the wall as a rest, their deadly rifle-barrels were instantly spitting out cunning little nickel-nosed leaden messengers that hummed merrily away to the rescue.

In a flash Hoppy took in the situation. It was going to be a race then, was it? Well, he had not won the mile as a cadet at Sandhurst, and at Aldershot later on as an officer, for nothing; and though this hot, sandy road could hardly be called an ideal running-track, and he was heavily handicapped with an eight-stone burden into the bargain, he smiled grimly as he picked up the little captain in his arms and stretched his muscles to the task.

As he forged ahead gallantly at an astonishing pace, Vare hanging limply over his shoulder, a great storm of cheering from the city walls came rolling and booming over the plain, and as he noticed from the corner of his eye how, one after another, the pursuers nearest to him suddenly collapsed into crumpled little multicoloured heaps, or, throwing up their hands, sprang like stricken deer into the air, he blessed the happy chance that had given him such clean shots and loyal hearts as were the men forming his guard that day. Cool-headed, too, were they; for, as an experienced sportsman selects for his first attention in early September the two old birds of a covey, so these sharp-shooters concentrated their fire upon those of Hoppy's enemies who ran the fastest or had the shortest distance to go to cut him off.

More than once the running man was upon the point of dropping his burden and drawing his revolver to give battle to an adversary whom it appeared almost impossible to avoid; but on each occasion the danger passed, and in the nick of time the fierce eyes burning with fanatical hate would glare with a sudden horror, and their light go out for ever. And now there is but a bare hundred yards of that mad race for life to be run, and the labouring, panting man, his heart thumping against his ribs as if it must burst its overtaxed valves, his breath coming in sharp sobs, and the perspiration rolling down him in rivulets, sees the gate flung open before him and safety almost assured. Almost, but not quite; for a small handful of cunning ones-who from the very beginning had

made direct for the gate, and thus, being the remotest from Hoppy, had avoided the hottest of the fire from the town-it was now evident would certainly reach the goal at the same moment as, if not a little before, the now rapidly tiring man. Running in close under the shelter of the high wall, they were practically out of sight of the men on the top; and on discovering this they set up shrill yells of triumph. For though their ultimate death was certain, they cared little for such a small matter when the reward was an assured future.

But they reckoned without their host. With cracking sides and bursting temples, the young Englishman, worthy son of the dominant race, made a last supreme effort, and, covering the remaining distance like a charging bull, fell with his unconscious burden into outstretched arms but a few feet in front of the whirling blades thirsting

to drink his blood.

But though safety had been won, there still remained a few moments of stern work; for the disappointed Ghazis, maddened at the loss of their prey, threw themselves in frenzy upon the guard ere the latter could close the gates. Of course it was soon over; the finest swords in Asia, wielded by the most expert of her dusky children, would not have availed against the thicket of long steel bayonets with the thrust of the Islanders behind them. Thus the half-dozen seekers-after-Paradise were promptly sent to their account, the tulwar of one alone having found its mark and laid a white man stark on the reeking ground under a pile of swarthy foes.

'Splendid, old fellow! This means a V.C. for you, I'll bet a penny,' cried an officer, one of several whom the sound of the firing had brought to the gate, and who were pressing round the two recumbent men, questioning, congratulating, and perhaps

envying. But suddenly the babel died away, there was a universal straightening of backs, the guard fell into some sort of order, and the General, followed by Colonel Morrison and another officer, strode into the midst of the group. There was a deep silence. The great man glared to right and left, his steelblue eyes taking in the scene and growing hard and menacing as they rested upon the pile of dead, and especially upon the body of the white soldier.

31

10

3

10

'Who is in command here?' he snapped out.

'I am, sir,' said Hoppy, getting on to his legs with difficulty.

'What is the meaning, then, of this commotion,

may I ask? 'Captain Vare, sir, was lying wounded out by the old tomb. I brought him in; and some of the enemy managed to get in with me, and before we could settle them killed a man of the guard.'

'He saved Vare's life, sir, and nearly lost his own,' eagerly broke in a young officer, a connection of the General's, and consequently a somewhat

privileged youth.

Sir John considered a moment, then sternly asked, as he faced the still panting Hoppy, 'What does it profit to save one life at the cost of another? You remember my orders as I passed in a short while ago?'

'Perfectly, sir.'

'What were they?'

'To keep the gate shut, and see that nobody went in or out.

'That will do. Rejoin your men.-Morrison, see that these bodies are looked after;' and, turning on his heel, the General strode away to visit some other part of his command.

(To be continued.)

SLAVES. WILL BEBRITONS NEVER

By R. A. GATTY.

OTHING delights a British audience more than the strains of 'Rule Britannia,' and people will shout themselves hoarse declaring that Britons never will be slaves. This spirit of independence, which shows

itself nowhere more prominently than in Yorkshire, distinguishes our nation from all other races in the world, and is the secret of our success at home and in our colonial possessions. No man in England is hampered, for instance, at the outset of his career by compulsory conscription. he likes to go into the army or navy he can do so, but he is a perfectly free agent. If he has ability there are no checks put upon his ambition, or any limit to the honours he may win. It is in this way the noblest and best come to the top, and the State is strengthened and

Legislation, ever since the Reform benefited. Bill, has been directed towards the abolition of all restrictions which used to handicap candidates for posts in the civil and military services, and religious tests have been abolished and our great universities opened to every creed and nation. It is no wonder Englishmen are proud of the institutions under which they live; and no citizen, even of a republican country, can claim greater freedom and more liberty of action than we enjoy under a limited monarchy.

There seems, however, of late to be a tendency to alter the present state of things, and in a measure to curtail individual freedom by legislation. It is no doubt an excellent law that every parent shall send his children to school or go to prison himself, but it impinges upon a man's liberty of action. A parent naturally wishes his children to be educated; therefore the Act of Parliament brought with it no sense of injustice. This was not the case when compulsory vaccination was propounded, and a compromise had to be effected.

The differences between workpeople and their employers led to the creation of trades-unions; but it is a question if the working-man has not had to macrifice a good deal of individual liberty in exchange for the benefits he has gained. He may have a good wage and be doing well, but if a strike is decreed he has to go out with the rest. He votes as his leaders direct, and he is allowed no choice or opinion, but is merely a unit in a huge combination regulated and controlled by the votes of the majority. If a man elects to be independent, and remains outside the union, he soon finds he has a very unpleasant position, and in a little time it is probable that the treatment awarded to non-unionists in Wales will be followed all over the country. Again, if a man in the heyday of his youth and strength feels he can do ten or even twelve hours' work, he is threatened by an Act of Parliament to restrain him from working more than eight. I am not for a moment presuming to say that trades-unions are not excellent institutions, and well worth the support they get from the working-classes; but there can be no question they encroach upon individual freedom of action.

Nor is it only the workman who feels this coercion. I was talking the other day to an employer about the state of trade, and he told me he was greatly handicapped by the trades-union. He pointed out some particular things he made which required considerable skill and accuracy, and said that only certain men who had been trained could do the work. 'It would be different,' he added, 'if I could put down a machine which has been invented in America. It turns out ten times the amount in aday which hand-labour can produce, and I should be able to complete my contracts much more quickly. When I suggested it, the union informed me it could not be allowed, as it would throw some men out of work,' 'But,' I said, 'England is a free country, and I should defy the union and act as I pleased, 'No, you would not,' he replied, 'if you were in my position. I have certain contracts to fulfil, and the men know it. If I disobeyed the mion they would strike, and I should lose the skilled hands who do this particular work, and I am unable to replace them in a moment, 'I should feel inclined to take the risk, and put down the machine, I said, 'even if I lost money by it.' But that is not all, he went on. 'I have a certain number of apprentices who pay me a premium, and who are very useful in the works. I could engage everal more, but the union will not allow me. They say it is taking work away from the workingman, and I have to submit.

I was again in the company of some business scattered who were very large employers of labour, amounting to thousands of men. This same subject

cropped up, and they told me that if labour difficulties increased and profits were cut much lower, they would remove their works out of the country and go where they were not hampered by strikes and unions. This was said in perfect seriousness, and some instances were quoted of large plants being removed with satisfactory results. Nothing, of course, could be farther from the intentions of the trades-unions than to bring about such a deportation of capital, which would mean ruin to the working-man and the commerce of the country. But unfortunately there is a growing feeling in certain classes of the community that by organising the ranks of labour, regulating the hours of work, and fixing a minimum wage, a remedy can be found for unemployment and other difficult problems. They do not seem to see that this practically means protection pure and simple, and is quite contrary to the principles of free trade.

One of the highest authorities on questions of this character, Lord Avebury, has recently expressed his views to a correspondent as follows: 'The want of employment is in my judgment due to several causes: (1) the enormous increase in our national expenditure, and especially in our military and naval preparations; (2) the equally great increase in our municipal expenditure; (3) the expectation held out that people will be provided for whether they work or not; (4) as regards London, the tendency has been to tempt people up from other districts. Emigration would take away the best of our working-classes, leaving the loafer and less industrious and least energetic at home. The constant increase in wages shows that there is a demand here for good workmen.' Lord Avebury does not advocate the application of socialistic nostrums such as the restriction of the hours of work and a minimum wage, but he points out the causes which have brought about the present want of employment, and how they can be remedied-namely, by a reduction in expenditure both national and municipal. He speaks as an expert economist, and his words are worth serious attention.

There can be no doubt that the socialistic ideas which the Labour party has prominently put before Parliament are tingeing the legislation both of the House of Commons and municipal bodies and county councils. For example, trusts have always been held as sacred obligations laid on trustees, whose breaches of trust, when they have occurred, have always been met with the severest punishment. Yet the Education Act proposed to sweep away something like ten thousand trusts, and upset the pious intentions of their founders. It may all be the best thing to do under the circumstances, and I am not presuming to say the Education Bill was not an excellent piece of legislation; but it was also an interference with individual liberty of action.

When a man makes his will, he believes his wishes will be respected and carried out; and

relying upon this, he bequeaths five thousand pounds for the building and maintenance of a school, and directs that the religious teaching shall be the same as his own creed, whether Roman Catholic, Presbyterian, or Church of England does not matter. He creates a trust, appoints trustees, and the law of England endorses his action. It is high-handed, to say the least of it, to sweep away these trusts by a single Act of Parliament, and approaches more the moral law of despotism than the moral law of freedom. If you once establish the principle that the individual has no rights which the majority are bound to respect, then indeed you deliver a death-blow to personal liberty.

There is an old saying that an Englishman's house is his castle, where he is free to do as he likes, and if perchance he has invested his savings in a small freehold cottage and garden, it is none the less a castle in his estimation. Money laid out in industrial or other securities may fly away and vanish; but when you have bought a bit of land it is always there, and you can hand it on to your children. The owner of the castle, however, now finds that recent legislation has somewhat encroached upon his domain, and the value of his land has gone down as the rates have gone up. It was not so in the past, when a rate of three and sixpence in the pound sufficed to clear him from all charges; but he now pays between nine and ten shillings in the pound, which is a serious difference. I quote this high rate from the place where I live, and where I have evidence of the burden laid on small freeholders, though the rates are by no means as high as this throughout the country at present. What is this due to? Principally the enormous debt of the municipal bodies and county councils, which amounts to five hundred millions, and the tendency of legislation which sets in the direction of State aid. Formerly the rates were levied to pay for the poor-law charges and the roads. They now include all the costly machinery of county councils, rural district councils, and parish councils, and to this are added the burdens of education, baths, libraries, wash-houses, lighting, paving, water, and, in fact, everything that comes within the scope of municipal and county management. Unfortunately this is by no means the end, for we are threatened with various other schemes, such as the feeding of school children, old-age pensions, work for the unemployed, and every vagary which may enter the brains of our legislators. Who is to pay the bill? The man in the castle, of course, and he is beginning to realise the fact.

There was a remarkable speech made recently by Mr H. D. Buckland when addressing a meeting of the Auctioneers' Institute. Alluding to the shrinkage in the sales of real property, which amounted to over eight hundred thousand pounds less than

last year, he said: 'The growing burden of the rates and taxes was crushing the spirit out of the real property market. The overburdened ratepayer must live; and if the rates exceeded a certain figure he equalised matters by paying less rent, and less rent meant a lower capital value. This was a painful process for owners, who had to pay the piper and were not allowed to call the tune. A limit must be set to the growing impositions upon real property. Overlapping authorities, the multiplicity of spending bodies, complicated machinery, and the mass of officialism-these things were responsible for a growing distrust of real property as an investment, because it was in the nature of things regarded as the milch-cow for every extravagant scheme.'

Every one who has brought up and educated a family of sons knows how important it is to get the young men independent of help from home. The old saying of being born with a silver spoon in your mouth contributes more to the failure of men in life than anything else. I remember as a boy being taught to swinn with a belt round me, which my teacher held suspended from a boat-hook. So long as I felt I should not sink I managed to make the proper strokes, but when the belt relaxed I failed to keep afloat. Some of the elder schoolboys, noticing this, quickly had me out of the water, and then taking me to a deep pool, flung me headlong in. I swam ashore.

Lord Avebury strikes the right note when he ascribes one of the causes of unemployment to 'the expectation held out that people will be provided for whether they work or not.' State aid kills individual effort and pauperises the people, yet this is what is being widely preached as a remedy for all our social troubles. Such theories might possibly be put in practice in a Utopia inhabited by people who had no objection to slavery; but Britons are differently constituted. The spirit of independence is our national birthright, and it has won for us the position we hold in the civilised world. The temptations, however, are very alluring which are set forth in the Socialist programme, and many people are carried away with the idea that it is possible to put an end to unemployment and poverty by adopting them. The experiment in Poplar showed that the increase of pauperism was by no means checked by lavish expenditure, and that the moment the expenditure ceased the pauperism decreased. The statistics are as follows, taken from the Local Government Journal: In 1894 Poplar's pauperism stood at thirty-two per thousand; in 1905 it stood at seventy per thousand. Then came the inquiry, and now the pauperism stands at forty-three per thousand. This is a sufficient answer to those who advocate a reckless expenditure of the rates as a means of checking unemployment in our midst.

THE LUCK OF THE 'GOLDEN CRESCENT.'

PART II.

MONTH later the Golden Crescent, having cleared 'London river' and the outlying shoals, was butting her way down Channel against a westsou'-west gale. Deep down, below

a general cargo for Gibraltar, which Moses Grüber had adroitly secured in the interval, was stowed the hardware destined, in the first instance at any rate, for the coast town of Mahazen. She was a vessel of two thousand tons, staunch and stiff, and drawing but little water for her tonnage, with a sea-speed of ten knots and an unusually capacious coal-storage; this was useful, as it enabled her to keep clear of ports infested by prying consuls. And Ralph Heriot, hanging on to the bridge-rails in streaming oilskins, was pleased with everything save the weather, which had got steadily worse ever since the pilot had been dropped. He spoke a few words to the mate, who was on watch, and, dropping down the ladder, sought the shelter of his cabin. Here he was greeted by a companion whom, greatly against his own wish, he was taking for the cruise.

Charles Merton was an old schoolfellow whose path in life had been widely separated from that of the sailor, as—the son of a rich man—he had at the age of thirty come into a large fortune, and had spent his time 'trying to amuse himself,' as he had put it to Heriot. The latter had come across him in London on his return from his hurried journey to the coast, and had resisted stoutly the idea of taking him out on this speculative venture. In the seclusion of Merton's luxurious flat in Maylair, Heriot had argued in vain against his inclusion in the trip.

'What in the world,' he had said, 'do you want running your head against brick walls in this fashion? It is a different thing for me, as the world to me is an oyster I have to open to enable me to get my living; whereas you, a rich man, don't want to make money, and, I suppose, have no particular desire to be knocked on the head, or to find yourself the inhabitant of an Eastern prison, the slave of a wandering sheikh, of the hero of an international difficulty when the other nation holds all the trumps.'

But Merton was obdurate and persistent, avowed that he was sick of London, sick of shooting tame pheasanta, sick of society; he had no ties, and no one would particularly care if he were knocked on the head. In a word, he insisted upon coming if the beat the latter gave in at last with a good grace.

'Well, don't blame me,' he had said. 'I've told you all that's likely to happen, and if you will come I can only say that I shall be delighted to have your company, and in some cases two heads may be better than one.'

Merton 'signed on' for the Golden Crescent as steward's assistant at one shilling per month wages, and it was he who greeted Heriot as the latter stumbled into the cabin.

They carried bad weather across the Bay, but once they had rounded Finisterre the wind hauled to the northward, the sea went down, and the remainder of the trip proved pleasant enough. When they arrived at Gibraltar, the first person to step over the gangway was Don José Montero, somewhat to Heriot's surprise, as it was upon him he counted to carry out the programme he had sketched out for Moses Grüber at his interview with the latter worthy in Cannon Street.

But Don José was calm, dignified, and reassuring. 'All is well, mi amigo,' he said as soon as the first greetings were over. 'Our telegram will be sent to my house at Tangier, and I have there the right person to attend to it; but it came to my mind that you are—pardon me—not very strong in your use of Spanish, and that fat rascal the Bashaw of Mahazen might try and overreach you. He cannot pretend to me that he does not know our tongue, for I have had many dealings with him. Therefore, senor, with your permission, I come.'

'No one more welcome, Don José, and it was well thought of on your part. Will you send the telegram, or shall I?'

'That shall be my care,' answered the Spaniard, 'and then this evening perhaps you and Don Carlos'—he bowed with courtly grace to Charles Merton—'will honour me with your company at dinner at the Bristol Hotel. The day after to-morrow we may have alarming news from the coast; but then, after all, as my friend the Bashaw says after he has cheated some one, "Are we not all in the hands of God?"'

Three days afterwards the European press was busy with recounting how terribly disturbed was the coast of Morocco; how British, French, and Spanish subjects had been petitioning their respective Ministers in Tangier for protection against the ferocity of the tribes encamped outside two of the coast towns; and how warships had been hurried down south to avert the possibility of calamity. Leading articles referred to the Algeciras Conference with dignified scorn, and at least six newspapers in different countries detected unmistakably the hand of the German Emperor in this 'new disturbance of what was, after all, the peace of Europe.' A few people smiled; among them were a Hebrew gentleman named Ben S'liman and Mr Moses Grüber of the firm of Volsuss, Schmidt, and Grüber, of 1000A Cannon Street, E.C.

The heat of the sun lay white-hot as a searingiron across the land and sea as the Golden Crescent's best bower dropped with a splash and a rattle of chain-cable into four and a half fathoms of water off the coast town of Mahazen; but although lighters lumbered out across the short strip of water intervening between ship and shore, no cargo was started.

'There is, you see, unfortunately no confidence between man and man,' explained Heriot to Charles Merton. 'My arrangement with the Bashaw is that for every box of rifles and ammunition received a box containing dollars to the amount agreed upon should be sent off; as I take out the duros, so I place an equivalent in hardware in the lighter. Now, you will observe that the lighters have come off empty. It is a fool's game, as time is everything, and the vice-consul has been got rid of by a trick. I am very glad now that we brought Don José, as he can go and tell the Bashaw what we think of him.'

Don José, cool and dignified as if the thermometer were not somewhere about boiling-point, stepped into a boat and went ashore to argue with the Bashaw. His arguments were effective, and the remainder of the day was spent in frantic toil. Each case of dollars had to be opened and counted on the one side, each case of rifles to be opened and counted on the other; therefore progress was necessarily slow. But the donkey-engine wheezed, the sheaves in the derrick-heads whined like souls in torment, and crowds of stalwart men, streaming with perspiration, pulled the clumsy lighters to shore and back again. But for all their toil it was four days before the last case was landed, the last case brought aboard.

'By the holy poker!' said Ralph Heriot as the carpenter nailed up the last box of duros and the mate struck it down into the hold, where, along with its companions, it would remain padlocked till the ship saw 'London river' once more, 'we often speak of the luck of the Golden Crescent, but this is the softest thing we ever brought off. What ho, Charlie, for the foggy old Thames once more!'

Deep disgust was imprinted on Merton's features.

'And this is what I thought was going to prove something in the way of an excitement. Why, dodging the motor-buses in the Brompton Road is

thrilling in comparison.'

Heriot laughed. 'Your money's made, old man; mine's in the making; and although it may be exciting to be shot at, the excitement ceases when a bullet comes straight. Hallo! here's Don José just back from the shore.—All finished now, Don José; concluido, eh?'

'The duros, then, are all on board?' queried Don José with a smile,

'All.'

Bueno. But you and I, Don Ralph, are never averse from making a few more?'

'Not by any means. Have you any proposal to make?'

'It is thus. I have just come from the Bashaw;

and a messenger has come express from the camp of the Ouled-Boaziz—this, as you know, is the tribe who have bought the rifles. They are encamped an easy twelve hours' ride from here; and the Sheikh is so much pleased with the carbines—particularly, he says, with the ammunition—that he would wish to see and to speak with those good men who have brought them hither. He particularly invites us to visit his camp, as he wishes personally to place a further large order with us. He declines to treat through the Bashaw in this matter. The question is, shall we go?'

'Seems rather odd. Why the blazes can't he come here if he wants to see us so particularly?' said Heriot. 'Up to any tricks, do you think, Don

José?'

'I can see no reason why he should be, and this has been such a splendid contract that we should certainly secure another if we can.'

'What do you say, Charlie?' asked Heriot, turning to Merton.

'By all manner of means let us go.'

'There is one thing that will assist us,' said Don José, 'and that is, I have bought from the Bashaw the three finest horses I have seen for many a day. He gave a big price for them to the Sheikh of the Ouled-Boaziz. Where he got them I don't know; but I intended asking you, Don Ralph, to allow me to take them back to Gibraltar in the ship, where I can make a good profit by selling them to the English officers.'

'Of course we'll take them,' answered Heriot.

'In the meantime, if we decide to go, they will be useful to take us to the Sheikh's camp if we decide to accept his offer to visit him.'

'Let's sleep on it,' said Heriot. 'We've had four pretty strenuous days, and we can talk it over to-morrow.'

The next day it was decided that they should go.

. .

The boat was alongside, and Merton and Don José had gone down the ladder into her; but Heriot stood on the top of the gangway in converse with the chief-mate, an old and tried friend and companion in many an out-of-the-way corner of the world.

'It's just this, Thompson,' he was saying. 'I am taking a couple of blue lights in my pocket, for one never knows what may happen; and if we get back after dark and want to come aboard I shall burn one from the shore, probably to the south'ard of the town. If I do, send a boat in at once, as there will be hurry toward. I shall be back in two days at the latest, as with the horses we have it won't be more than an easy eight hours' ride. In the meanwhile, keep up steam, hoist the gangway ladder, and don't let any of the Bashaw's rascals aboard under any pretence. Heave in to a short stay, and trip the anchor and stand out to sea in case there is any attempt to rush you. I trust the Bashaw just as far as I could throw him with one hand. You understand, I'm sure?'

Thompson looked steadily into Heriot's eyes. 'I understand perfectly, sir;' and then, holding out his hand, he said, 'Luck, old man.'

Heriot returned the steady grip. 'Yes, I'm sure you wish us that. Adios!'

'Therefore,' concluded the Sheikh of the Ouled-Boaziz, 'it is written that you shall die, all three of you, for that you attempted to cheat true believers.' His sonorous tones ceased, and Don José, who alone understood, translated the sentence for the benefit of Heriot and Merton. It had been early dawn when the three men had arrived in the camp among the foothills which lead to the mountains, and they had been received with a most disarming courtesy. A tent had been set aside for them, and food had been provided to supplement the scanty supply which they had brought. All night they had ridden, guided by a gaunt tribesman with a long Tetuan gun slung across his broad shoulders; but Heriot took careful note of the way and frequently consulted a pocketcompass by the light of a powerful electric torch he carried. He was careful to avoid letting the

guide see what he was doing. The horses were hobbled, watered, and given a measure of barley, and the three men smoked and dozed until the hour appointed for their interview with the Sheikh. The fierce heat of the noontide subsided somewhat as, comparatively early in the afternoon, the sun sank behind a giant mountain-

Their guide appeared and intimated to them that it was the pleasure of the Sheikh to interview them. They found him seated at the door of his tent. On his right was the Sub-Sheikh of the hibe, on his left two of the elders. The keen, aquiline, handsome face of the desert potentate showed no sign of a welcoming smile, and he did not rise from where he sat on a tarnished silken cushion. He drew his brows together till they formed a finely pencilled straight line across his forehead, and to Don Jose's greeting of 'Salaam, O Sheikh!' there came no answering response of 'Salaam, Alei-koum!' as courtesy demanded.

'Something very wrong here,' whispered Merton to Heriot.

'Yes; but don't talk, and for goodness' sake keep a stiff upper-lip whatever happens. I can't understand what he's saying; but there's trouble in the

On each side of them a hedge of dark-faced, sinewy tribesmen leaned upon their guns in the altitude of interested spectators at a play, and over the mountains the shadows darkened. Heriot, Merton, and Montero were apparently unarmed, as the mystery of the American hip-pocket was not within the cognisance of men who did not war trousers; each carried a heavy six-shooter in this convenient receptacle.

The cause of the trouble was soon explained. At the side of the Sheikh lay one of the carbines

brought from the Golden Crescent, also a box of cartridges. The box was marked with the name of a foreign firm, and the cartridges were-dummies.

'Saving turn of mind that firm,' said Heriot with a shrug of his shoulders. 'I suppose five bob would have put cordite instead of coal-dust into those confounded cartridges, and that five bob is just the price of our lives, I'm thinking. Mind, this is none of old Grub's doing; but if I live I shall talk to Pfungst.'

The Sheikh motioned forward three young men, who each picked up a carbine and slid a cartridge into the breach from the box which lay by his

'He says,' said Don José in a level, unmoved voice, 'that he is now about to show us how harmless are these cartridges before he uses some that will shoot. Keep steady; the cartridges are really useless.'

Nevertheless the ordeal was trying, as at a guttural challenging order from the Sheikh the three men raised the carbines to their shoulders, and the three adventurers saw the business ends of the weapons pointing straight at their hearts. There was a tense, strained silence, a further command, and then a sharp click showed that the triggers had been pulled. Not one of the three from the Golden Crescent had moved so much as an eyelash. The tribesmen jerked out the dummies and reloaded from the same case. Again the same pantomime. As the carbines were lowered a second time, at a sign from the Sheikh the men placed them on the ground and stepped back among their companions.

Don José spoke rapidly. 'Whether they kill us now or to-morrow morning matters little. Señores, shall we take it fighting, or die like bullocks in the shambles at daybreak, with torture perhaps before?'

'We fight now,' said Heriot in a low, swift tone. Back to back, comrades; but don't draw till I tell you.'

Merton edged nearer to the Sheikh, who had risen to his feet. 'Before I draw mine, old man, I'm just going to have a smack at that abandoned ruffian, for the sake of old times, and to demonstrate that the runner-up for the heavy-weight boxing championship can still hit out.'

Don José's level voice struck in.

'He is ordering them to seize us and tie us up.' As he spoke his hand stole to his hippocket.

There was a sharp order from the Sheikh and a stir among the crowd, who began to advance, but as they did so Merton stepped forward, and all the science and skill gathered in many a hard-fought bout with the gloves went into the terrible crashing right-hander which caught the Sheikh fair on the point of his aristocratic chin. With a half-turn of lightning rapidity, marvellous in so heavy a man, the assailant swung his left in round arm, and catching the Sub-Sheikh fairly behind the ear,

dropped him in a confused heap on the senseless body of his chief. Then Merton stepped back and drew his revolver, and by this time it was nearly dark. The sudden assault on the Sheikh had absolutely paralysed his followers; but now an ominous growl ran through the ranks, and again Don José spoke, still quietly and with a perfect command of himself and the situation. They had disposed themselves back to back.

'Señores,' he said, 'the first man that steps forward, shoot him dead. Our one chance is to

move in the direction of our horses.'

A man apparently of some authority stepped in the direction of Don José and shouted an order. The revolver in the hand of the Spaniard cracked, and the man fell dead in his tracks.

'Uno,' he counted coolly. 'We cannot afford to miss, Don Ralph.'

'They're getting closer. Shall we brown 'em?' asked Merton.

'Not if we can help it,' answered Heriot; 'but it's so precious dark one won't be able to see to shoot them singly down. By Jove, I have it!' He thrust his hand into his breast-pocket and pulled out the electric torch. 'This'll give us light enough to die by, anyhow.' He pressed the button, holding it on a level with the heads of the crowd, and the clear pencil of light fell full upon the dark, scowling faces.

There was a wavering movement, a wild yell of mad, hopeless, unreasoning terror, and then in the gathering darkness the lean legs of the frantic tribesmen carried them at railway speed away from the magic of the Evil One.

Don José threw out the empty shell and pushed a fresh cartridge into the empty chamber of his revolver. 'Por todos los Santos,' he ejaculated piously.

'What's up?' queried Merton.

'Just this, my friend, that a scientific toy has saved us from a remarkably unpleasant death. Our friends think that we are in league with Shaitan. However, don't let's give them time to recover. To horse, señores!—to horse!'

On the outskirts of the camp, where they had left their horses, there they found them, as the Sheikh had directed they should be so left until the owners were comfortably buried. Don José slashed through the straw hobbles with his great navajo de Sevilla.

'I had thought there had been other work for thee,' he said, gazing affectionately at the blade as he thrust it back into its sheath hidden in the folds of his crimson silk faja, 'before this night had been out.'

The sun had risen behind them and the sleepy wardens of the great town gates had just pushed

them wide when the trio galloped up.

'Through to the water-gate, Don José. We'll pinch a lighter and get these nags of yours off before the Bashaw's awake,' was Heriot's command; and they found the very craft they wanted alongside the stone-faced quay where the great arches re-echo the thunder of the Atlantic surge in westerly weather. But this morning it was a flat calm. As they pushed off, the owner of the lighter protruded a sleepy head from the frowsy nest in which he had been sleeping, and was instantly commandeered and made to row. As they lumbered alongside the ship the derrick-head drooped, two men dropped on the lighter's deck and slung the horses, and, before the lighterman was fairly aware of what had happened, the horses stamped on the deck of the Golden Crescent, the best bower of that staunch vessel was dangling at her bows, and with a widening, whitening wake through the still blue water, she swung hard on her port helm till her bows pointed nor'-by-east.

'And if you can say, Grub, that I haven't earned 10 per cent., and if you can say, Charlie, that I didn't give you a run for your money, then you're the two most ungrateful men in the city of London.'

It was thus that Ralph Heriot spoke in con-

clusion.

Moses Grüber filled the champagne-glasses, and winked slowly with an intense enjoyment of the process. 'I have, my dear captain, no complaint. And Mr Merton?'

'By Jove, no!'

Moses raised his glass. 'Then,' he said, 'we will drink once more to the luck of the Golden Crescent.'

THE END.

AFRICAN INDIA-RUBBER.

By GILBERT R. REDGRAVE.

HE great increase in the demand for india-rubber occasioned by the invention of the pneumatic tire and the development of the motor and the bicycle industries has stimulated explorers in all parts of the world

to discover fresh sources of the raw product, and the native supplies of rubber will very shortly be reinforced by cultivated rubber from Ceylon, the Malay Straits, and from various other localities, where many thousands of acres have been planted with seedlings within the last three or four years. It has been stated by experts that if a continuance of present prices can be relied upon there are few crops likely to afford such large returns as those to be derived from the cultivation of india-rubber.

The world's chief supply from the early days of the rubber industry until now has been obtained, as

is well known, from the vast forests bordering on the river Amazon in South America, the produce for the most part of the Heven brasiliensis, a tree scattered over wide areas of territory, throughout which the full-grown timber is found somewhat sparsely distributed among the trees of other species. In recent years, partly in consequence of the need of obtaining increased supplies and partly owing to the competition of collectors, it has been necessary to go farther and farther afield, and to explore new areas in these tropical forests. The difficulties entailed in providing labour and fitting out fresh expeditions each year have often been described, and it is only possible to obtain the rubber at the cost of numerous accidents and at a considerable sacrifice of life, even among the hardy race of natives who are engaged in this industry. It has been stated on good authority that under ordinary circumstances not more than eight full-grown trees suitable for tapping are found on each acre of forest land, and the wages paid to the labourers in Brazil are very high compared to the price of labour in some other tropical countries. Even under these disadvantages the weight of South American rubber exported in 1905 was upwards of thirty-four thou-

Mainly owing to the fact that the chief port of shipment is at Para, the Amazon rubber is usually designated as 'Para rubber,' and the uniform good quality of this product, which commanded the highest prices in the market, has caused it to become the standard of excellence with which all other classes of this material are compared.

It will be understood from the above description that in the earlier years all the rubber coming into the market was of the nature of 'wild rubber,' or such as is furnished from indigenous timber. As has already been pointed out, a new industry has now arisen in planting trees raised chiefly as seedlings from the Hevea tree, and the cultivation of rubber is likely to be an extremely profitable investment, while there can be no doubt that it is an exceedingly popular one at the present time. No less than one hundred and twenty thousand acres are now planted with rubber in Ceylon alone, and very large areas are being brought under cultivation in the Malay Archipelago. The one drawback with respect to this business is that some considerable time must necessarily elapse before the young trees can be tapped, and thus the investor must be prepared to wait for five or six years before any returns can be expected on his outlay, while large sums must be expended on the plantations before they reach a revenue-producing stage. Thus, at a very low estimate, not less than two million five hundred thousand pounds will have to be spent on the abore acreage in Ceylon before any profits will be forthcoming from this source, and at first the amount of sap or latex which can be extracted from the young trees will be relatively small.

It is no wonder, therefore, that explorers in all Parts of the world are searching for native rubber-

yielding trees, and the number of these already known is very large. Many of the tropical forests abound with plants more or less capable of affording a supply of marketable rubber, and certain of the wild vines in the African forests yield a latex of excellent quality. The difficulty is that rubber collected by natives who are not always subject to skilled supervision is found to vary very greatly in quality and to be as a rule badly prepared, in the sense of being dirty and adulterated. There is no product which suffers more largely in value from the imperfect condition of the raw material than india-rubber, and a sample of rubber which, if it had been originally well prepared, might have readily been sold for four to five shillings per pound will, owing to inferior manipulation in the first instance, be valued at less than half this sum. The cultivated rubber now being obtained, which will be produced under skilled advice and with the best appliances, will, it is understood, compete on very favourable terms with the standard of best Para wild rubber, fine samples of which have lately been sold at five shillings and twopence per pound, whereas consignments from Ceylon and from Malay plantations have fetched as much as five shillings and ninepence per pound.

Much attention has lately been attracted to the rubber from Western Africa, chiefly in consequence of the alleged atrocities in connection with its collection under the supervision of the officials of the Congo Company, and some details of this industry may be of interest at the present time. The so-called 'silk rubber' of the Lagos district is the product of a forest tree originally known as the Kickxia elastica, but now named the Funtumia elastica. Many of the specimens of rubber from the West Coast are, however, derived from 'vines' or creepers which grow in the wildest profusion in the tropical forests, and hang in festoons and clusters in every direction. The practice has hitherto been to cut down these vines, and, after dividing them into small pieces, to boil the stems in order to extract the juice or latex. This mode of collection is obviously a very destructive and wasteful one, and district after district has been denuded of the vines, which are of slow growth. The rubber somewhat carelessly prepared from the wild vines has not the same market value as that produced from the silk rubber-tree, and the vines do not appear to lend themselves well to artificial cultivation. Attempts have therefore been made to produce seedlings of the Funtumia elastica for the introduction of the rubber industry into other parts of Africa.

The knowledge of the properties of the silk rubber-tree in the Lagos district dates back only a little over eleven years, as the Kickxia was not known as a possible source of rubber before 1895, previous to which year the total export of this material from Lagos was about twenty-one thousand pounds per annum, whereas in 1895 the export of india-rubber at once reached a total of five million pounds.

The introduction of this tree into the Uganda Protectorate reads almost like a romance. Steps were taken several years ago to obtain seeds from West Africa, and in the first instance, a supply having been procured from the Gold Coast, a number of young plants were raised by the Government botanist. Concerning these Mr J. Mahon, in his Report on Exotic Plants of Economic Interest in the Botanic Gardens at Entebbe, published by the Foreign Office in January 1903, states: 'A serious loss occurred last June in the burning down of a large nursery-shed through native carelessness, when a fine batch of the celebrated silk rubber of Lagos was lost, in company with other things.' Mr Mahon refers also to a plant obtained from Kew, and states : 'I feel certain Lagos silk rubber will prove a suitable culture here for plantations in the lake region.' In the General Report on the Uganda Protectorate for the year ending March 31, 1904, we read concerning the Funtumia: 'A case of these rubber-plants was received from Kew in September [1903], only one plant dying in transit; they were planted out shortly after arrival, and are now making good progress.' In the report for the following year attention is called to the results of a systematic inspection of the forests of Uganda undertaken by Mr M. T. Dawe, whose valuable account of a subsequent botanical mission was published as a parliamentary paper in the course of last year. We learn from this latter document that 'until two years ago practically nothing was known of the economic resources of the larger forests of Uganda. In September 1903 Mr George Wilson, C.B., then His Majesty's Acting Commissioner for Uganda, arranged that I should inspect and report on the Mabira forest of Chagwe, which was done during the following month. To illustrate the importance of this forest exploration, I may mention that, amongst other things, the result of that mission was the discovery of Funtumia elastica-the Lagos silk-rubber tree-which was not hitherto known to exist in Uganda, and its rubber had never been exploited by the natives.' In a later journey this tree was found to be widely distributed over the protectorate, though nowhere in the same abundance as in the Chagwe forest, where it was first discovered.

It has been estimated as the result of a very careful computation that on an area of some fifty-four square miles in the above forest there are not less than one million seven hundred and sixty thousand rubber-trees, and that over some twelve square miles of territory there are on an average one hundred and fifty trees to the acre. After all the laborious attempts made to propagate this valuable source of rubber, it came as a genuine surprise to find that the tree already existed in great abundance in various parts of the protectorate. No time has been lost in opening up these districts, and a lease of the forest for twenty-one years has been granted to the Mabira Forest Rubber Company, constituted during the course of last year with

a capital of one hundred and twenty thousand pounds.

The Uganda authorities have laid down certain rules for the collection of rubber, and a permit must be obtained for this purpose. Among these regulations it is made a condition that systematic planting must be resorted to; but it would appear that at the time the rules were drafted the authorities had only the possibility of obtaining rubber from the wild vines in view, and that the existence there of the Funtumia was not then known.

The discovery of this tree and its successful utilisation must be of untold benefit to the future of Uganda, and the company in possession of this lease appears to have a prospect before it of a rich harvest. With, at present prices, a yield of only half a pound of rubber per tree from one million trees each year, the profits would enable the company to distribute annually considerably more than 50 per cent. on its capital in the shape of dividends; and as time goes on, and its plantations extend, its income would rapidly increase. By the aid of the steamers on Lake Victoria Nyanza and of the Uganda Railway the rubber produced in the Mabira forest can be transported to London in less than a month, and with careful preparation would no doubt command a very high price.

THE INDIAN.

HE sees the stars unfold their rays
Across the heavens' silent ways;
The forest glooms on every side;
The broad-wayed river rolls its tide
From the white Andes far away,
Where the snows melt at high noonday.
He knows not what it all may mean
To him and to his dusky queen;
Yet voices that he scarce can hear
Seem ever whisp'ring in his ear.

Afar, afar, at evening-tide
The chapel-bell by the river-side—
The tiny chapel painted white,
With the tiny cross at the rooftree's height—
Rings from its vibrant silver throat
O'er swamp and wood its wistful note;
The cayman stirs in his bed of mud
By the mighty Amazon's tawny flood,
The fireflies dance as the day grows dim,
Mosquitoes rise to their night-long hymn.

He wonders seeing through the trees
The black-robed padre on his knees,
Through the door of the tiny chapel white
The gleam of the pallid tapers' light;
Wonders to hear the deep Amen
Bchoing o'er and o'er again.
Steals away to his hut of grass
Hid in the mists of the vast morass.
Ah, will he ever understand
The whispers of Never Never Land?
A. W. HOWLETT.

ANOMALIES INCOME-TAX COLLECTION. OF

BOUT the political ethics of the income-tax as at present applied there is one view which is almost universal among the efficient and producing classes of this country;

but one may yield the point that on a vote being taken there might be found to be more people who would stand by the tax on the grounds of necessity and expediency than some people suspect. Passing it thus as a necessary evil, one expects that the most particular justice and the nicest tact and the most scrupulous fairness shall be employed in the methods of obtaining it. But even the minority who would defend the principle of the tax on its merits would not stay to support the present methods of its collection, which, it is safe to say, are not merely unsystematic and irregular, but are frequently unjust and un-English, so that it is probably the case that the greater part of the irritation which endures permanently throughout the country—chiefly among the middle classes, who are notoriously the greatest sufferers by this tax—is the result not so much of the tax in itself as the dark methods by which the collecting authorities obtain possession of it.

Nowhere else in the entire British system is there anything that can compare with these methods for irregularity and tyranny; there is no principle or detail of the government of the country which ever suggests as this tax does that the boast of the freedom of the Briton is a little exaggerated. There is an element of cunning in the business which is not agreeable to our taste. It is not one's business to seek for explanations as to why these mysterious and irregular methods are adopted in this matter as they are in no other; but an elementary and plausible view would be that the chief authorities of the present day have inherited a misgiving about the principle of the tax from their generations of predecessors, and they are still without the courage for its thorough application to all the people whom it concerns. The almost inevitable result of such pusillanimity as this is the discriminating between reson and person, and class and class; the screwing

down of the weak to make up for the lightening of the burden of the strong. The proper sum of the tax must be obtained, and the minus amount in one section must be balanced by the plus yield in another; and by this oppression of the weak and concession to the strong the collecting authorities find themselves embarked upon methods about which there is infrequently anything that is creditable, and often much that is tyrannical.

The anomalies of the system and its consequent injustice may be best explained by illustration and example; and in the first place one is led to remark upon the hopelessly complicated character of the form to be filled up for assessment, which has over and over again proved beyond the capacity of persons of quite average intelligence to understand in relation to their own particular circumstances. It abounds so much with cross-references and contradictions, and so many different shades of meaning can be attached to particular terms, chiefly in the matter of the exemptions, that highly conscientious people, with a whole-hearted desire to do their full duty by the State, have sometimes found, to their chagrin, that for many years they have been paying too much to the national revenue by way of this tax; while, on the other hand, there are shrewd people with a little time to spare and much patience who have achieved wonderful results in the matter of proving their title to large exemptions. The man who has no separate and clearly defined business in a town, but who is engaged in some occupation which he fulfils for the most part at his domestic residence, is at one and the same time he who has most possibilities in the way of securing exemptions if he prosecutes them with sufficient ingenuity and determination, and he who is most frequently mulcted in more income-tax than he need pay. The intricacies of the extent to which a room in the house may be considered an office, new typewriters, stationery, and stamps be considered as business charges, and a lady of the household-one's wife even-giving constant assistance be considered as in employment in a clerical capacity, are points to which no more attention [All Rights Reserved.] APRIL 20, 1907.

than mere mention need be given on the present occasion, such mention being sufficient to suggest the large possibilities for doubt and confusion; while it may be added that in the writer's experience such points have frequently been at real issue, and that, in keeping with their reputation for the perpetration of anomalies, the authorities have given varying and often contradictory decisions.

Now, here is a curious case which shows how irregular and illogical it is possible for the methods of the collector to be, even though this is one of the few instances in which the poor taxpayer came to gloat in triumph over the cunning enemy. Last Christmas Eve, as ever, a select party of literary and artistic gossips sat round the fire in a London club telling stories of members' sudden deaths, murders at cross-roads, and other seasonably cheerful subjects, which being presently exhausted, the séance was terminated by a recital of some of the saddest income-tax experiences that have ever been listened to. But a man who is very celebrated in literary life told a rousing and most heartening The income-tax people, so he said, waited upon him at his residence on many occasions and requested him to fill in the buff paper so that he might be properly assessed; but he consistently refused to do so, giving as excuse that he could not understand the instructions, and that, moreover, he had conscientious objections to disclosing on a sheet of paper to which all kinds of persons might have access such profound secrets as he would not tell to his most intimate relative.

Somehow the excuse seemed to be accepted for a while, and for two or three years the authorities assessed this man without the slightest clue of any kind whatsoever as to his means and income. (Surely this in itself, common enough as the practice is, is in the national interests a most ridiculous thing.) As he did not object, and was on the whole quite well satisfied, it may be taken for granted that the assessors did not do anything like justice to his earning capacity. But eventually they appeared to become uneasy in the matter, and when the collector called in due course with respect to the assessment for the forthcoming year he declared that he must have a return. The matter was argued for some time, and eventually the collector pointed out that, in case of refusal to make the return when demanded, the person refusing could be fined, and in this case probably would be. 'And supposing I refuse to pay the fine, as I shall do, what then?' 'Then,' exclaimed the collector with some gusto-then, my dear sir, you will most certainly be sent to prison!' 'Excellent!' retorted the literary man. 'I wish very much to go to prison in a matter of this kind, so proceed. And now, good-morning!' But the collector stood aghast at the prospect of a man who thus desired to go to prison instead of paying income-tax. The matter was further argued, and the novelist pointed out very circumstantially and convincingly how he would certainly make very much capital out of being sent to prison in such circumstances, and how the advertisement would assuredly do him an enormous amount of good from a pecuniary point of view. This view appealed to the collector, who did not like the idea of anybody profiting in such a way out of the income-tax. He said he would go back and see about it. The result was that the man who wished to go to prison heard nothing more about making any return, and from that day to this, despite a substantial increase in his fortunes, he is troubled no more, but is regularly and kindly assessed at about one-third of his proper value. The story is simple enough; but it shows us very plainly what a loose sort of thing this incometaxing system is, how far too much is left to the 'discretion' of the collectors and assessors, with the inevitable result of unfair practices, and how the whole machinery would be better for a little of the red-tape of which so much might well be spared from some of the other Government departments.

We have thus seen how the collector may be cowed; let us now see him playing the part of lion to a very small mouse. Here is a case which is a fair sample of hundreds-very likely thousandsof its kind which take place annually. There is a small shopkeeper who, with little or no capital, and amidst severe competition from large stores run by limited companies, succeeds in establishing a little business for himself, which, he finds, yields him just about one hundred pounds a year. It is a very small income, and he has a wife and two children to keep on it, and preserve in some outward appearance of respectability; and, moreover, he has to work terribly hard to enable him to maintain a firm stand against the big stores which constantly threaten to swamp him. We only mention the trying circumstances in which this little shopkeeper is placed in order to suggest that this surely is a case for fair and considerate treatment, and that if ever the collector is to be empowered with any 'discretion,' this is the time when he should exercise some of it. But it would appear that the shopkeeper is not a man of much account, and he is weak and timid. It happens that besides his hundred pounds from his shop he has an annual income of just sixty pounds from investments in some house and other property, some of which have been made as the result of savings effected with great difficulty, and often enough at the cost of insufficient food and clothing, and the remainder as the result of a little windfall that once befell him. His total income of one hundred and sixty pounds a year thus entitles him to complete exemption from the income-tax. See what happens in the process of the very artful dodge which the collectors of the tax have invented for his discomfiture. He makes his full return and his claim for complete exemption, and expects to hear nothing more of the matter. Presently he receives a demand-note informing him that his 'business'-nothing said about the minor part of his income-has been assessed, not at one hundred pounds, but at one hundred and sixty pounds, and that one hundred and sixty pounds

abatement has been duly allowed to him. There is thus no charge made upon him, and it does not seem to him to be a matter to worry about as to whether his business is assessed at one hundred and sixty pounds or one thousand six hundred pounds so long as there still remains nothing to pay, as in this case. But later he receives a demand-note with respect to the investments, and now he realises for the first time that while income-tax and property-tax are the same thing, the Commissioners may separate them on one occasion and join them on another with some resultant advantage to themselves. Having exhausted his exemption, as already pointed out, he is now informed that he must be taxed on the full sixty pounds, and he appeals against the unjust demand, pointing out that his return clearly showed that his total income was only one hundred and sixty pounds. 'Surely you are wrong,' they say. 'Your income from your business was assessed at one hundred and sixty pounds, and if you objected to that assessment you should have appealed against it. You did not appeal, and therefore it was passed, and your total income stands at two hundred and twenty pounds, with tax to be paid on sixty pounds. Hurry up!' And so he pays.

It may happen that there may soon afterwards come into the shop of that small tradesman a customer who is the wife of a working mechanical engineer, whose employers are extremely busy and prosperous, so that the employés are all sharing in the good time. The husband has been doing some overtime, and his wages for a week in these days come to four or five pounds, and sometimes more than that. The wife buys all kinds of fancy jam, pickles, smoked sardines, and a variety of other luxuries. This she can afford to do, because her husband is a working-man, and therefore does not have to pay income-tax. We have nothing against the working-man as such, and we sincerely congratulate him on being the one who scores most in respect to the exercise of the 'discretion' of the income-tax people. The working-man would be a very difficult person to tackle for the tax in more respects than one, and it is plainly the policy of the authorities to pursue the line of least resistance. But it must be aggravating to him, as to all other people, to reflect that his only chance of becoming a citizen who does his share towards the upkeep of this costly Empire, while the poor shopkeeper is doing more than his share, lies in the possibility we will say the remote possibility—of his becoming very intoxicated in the evenings, and so paying something very trifling to the Government by way of indirect taxation. Of course there are thousands and thousands of persons in this country who come legitimately within the meaning of the term 'working.men, who yet earn from three pounds ten to our pounds ten a week, and who have never been sked for a penny of income-tax in the whole of their lives; and, what is more, the authorities know these men and could put their fingers upon them without the slightest difficulty.

But what of another class who are called working-men but who do not come legitimately within the meaning of that term, yet whom the complaisant authorities are quite willing to accept as such and to exempt from the tax or the trouble of answering any questions about their means? 'Working-man' is the password to exemption, and any man who will dress the part, eschewing well-cut clothes and silk hats, and taking care to live in a small way in a small house-thus keeping his money to himself and doing less for the community than the man who spends reasonablymay be immune from the income-tax. Let me give an authentic instance which has recently been quoted to me. A man engaged himself as an assistant in a small way to a large firm of professional photographers. At the beginning of his connection he was not quite liable to the tax, but he soon strengthened his position with the firm and became interested in a new and important development, so that gradually his weekly emolument reached the handsome figure of twelve pounds-largely made up on a system of percentages of profits-and round about this figure it remained for some years, during which time the salary remained as at first. But in his habits and ways of living, and also in his description of himself, he is still a working-man, and it is gratifying to him to know that he has never yet paid any of this tax.

Here is another matter which reflects no credit whatever upon our system of income-taxation. The high authorities will tell you, with something in the nature of pride upon their business ability and efficiency, that a large proportion of the revenues that they conceive to be due to them are 'cut off at the main'-that is to say, that in all cases of incomes derived in the form of dividends from Government stocks and shares in public companies they take their tax before such dividends are sent along to their owners. When making his annual return the taxpayer is still called upon to state the extent of his income from these sources, although it is already taxed and done with, so that the authorities may use the evidence against him in making him pay more tax on that part of his income that has not yet been meddled with. But the tax is deducted from the dividends beforehand without any reference to the total income of their recipient. The taxers do not know it, and they do not want to know it, for if they did and were called upon to act on their knowledge it is clear that in an enormous number of cases they would have no right to make any deduction for the tax. The total income of the recipient may be within the amount which entitles him to complete exemption from the income-tax, or it may be such as to entitle him to substantial abatement. If a man has an income of one hundred and forty pounds from the Fundsand that income only-he has the tax deducted from every pound of it before it reaches his hands. although the Government is not entitled to a single penny. In the same way the man with an income

of five or six hundred pounds from such a source has the tax deducted from the whole instead of from a part. It is true that the unjustly taxed person is told that he may make a claim for repayment—told when he inquires about it, that is—and that the claim will be considered in due course, and that in this way, if he is very patient and energetic, he gets his money back again. What, then, can be the object of the taxers in putting themselves to the trouble of taking money out of a man's pocket if they have to go to much more trouble to put it back again? This is another little trick—not the kind of trick that would be countenanced for one moment as between man of business and man of business in any considerable commercial centre, but one which comes quite naturally to the taxers. The shrewd judges of human nature who regulate these things know well that among the people from whom they are getting something that they are not entitled to, by 'cutting it off at the main' in this way, is a large proportion who are either tired out with a busy life or have too much to do to give the proper attention to such unusual and unexpected business as this, others who are prone to neglect, and more again-such as the widows-who are inclined to bungle in such matters; so that all these people, from the various causes, do not proceed to get the exemption or abatement to which they are entitled, and do not get their money back. And so, though it is not theirs, and they have no moral or legal right to it, the taxers keep it, and they have reckoned beforehand on thus being able to keep it. Some people have a very harsh word to use for this kind of thing.

But suppose the man does protest and appeal. He is then summoned to appear before the Commissioners and surveyor, and take with him all his private account-books, bills, receipts, and everything bearing upon the inmost secrets of his affairs, such as he might often hesitate to expose to his brother, or even his wife, and lay them bare before a set of complete strangers, and answer questions of the most impudent character that are put to him by these persons, who do not hesitate to suggest that they believe that in every word he says he is lying, and that he has falsified returns and documents like a common forger for the purpose of deceiving the Commissioners. When he has passed through this humiliating procedure he is excluded from the room while the Commissioners and surveyor-his judges and his prosecutor-deliberate upon his case, and come to a decision by a process of argument and deduction of which he is never made aware. Against this decision there is no appeal on points of law. Is it to be wondered at that thousands of British people who have preserved their innate delicacy of feeling shrink from passing through such an ordeal as this, and prefer rather to give up their gold to the marauders?

The anomalies which we have thus seen to be created in the exercise of the taxers' 'discretion' have been more or less local and promiscuous in

their operation; but there are anomalies which are perpetrated on a grander scale, in which a distinction without reason is even drawn between the component parts of the kingdom which are nominally subject to precisely the same national taxation to be administered in precisely the same way. A distinction is drawn between England and Scotland, and we may assume beforehand that Scotland gets the worst of it, since she is presumably the weaker partner. She does. The Scottish income-tax payer is called upon to part with his money some three months before his English brother-victim has to do so. Thus towards the end of last year the Scot who is liable was served with a notice that he must pay his tax for this year on or before January 2nd. His second notice was that he must pay on or soon after January 22nd. The average Englishman is not called upon to bestir himself seriously in the matter until the end of March, and often enough he does not pay the tax until the middle of summer. It is little wonder that in Scotland there is considerable indignation on this point, and that there is talk of this year, being the bi-centenary of the Union, being a good year for formidable protest. It is pointed out that if Scotland pays her income-tax at the beginning of the year instead of at the end of March she is deprived of the use of about three millions of her own money for three months of the year. The natural result is that her trade is hampered to a considerable extent through her being obliged to seek the help of the banks and pay heavy rates for accommodation.

The ingenuity of the collectors in gaining advantage over the taxpayers is really most wonderful. Their guile is superb. Here now is another dodge of recent application and most complete success. A trap is laid to tempt the taxpayer-the English taxpayer, too-to pay his income-tax some months before he needs to-in the year preceding that in which it is due as a matter of fact. This is how it is done. As every tenant of a house knows, the authorities duly charge him with income-tax under Schedule A, which is not an income-tax at all, but a tax on the house occupied at so much in the pound on the rental value. This tax is levied on the tenant, but on the demand-note there is placed a notice to him to this effect: 'The landlord is bound under a penalty of fifty pounds to allow out of the next payment of rent after the date of the receipt the amount of duty paid under Schedule A up to an amount not exceeding one shilling in the pound on the rent payable for the year. The receipt should be produced when the allowance is claimed.' There is much more in this than meets the eye at the first glance, and please let it be noted that the italicising of the word 'next' is done by the authorities and not by the present writer. The trick lies in the circumstance that in the application for it this tax is grouped with, and put on the same bill and added in the same total as, the income-tax proper, and the demand for the combined amount is sent out a few days

before Christmas—that is to say, just on the eve of the householder's quarterly rent becoming due. Here is the bait, that if he pays up the property-tax, and with it the real income-tax which is not due yet, and which need not really be paid for from three to six months—if he pays them by return of post he can then get his money back from his landlord when he sends in the rent a day or two later. If he does not do that he cannot get that money returned until the end of the next quarter. Here you have the complete significance of that italicised word 'next' in the collector's note.

Of course it is the middle classes that are chiefly the sufferers by all these methods; and as if all their suffering were not enough, the word is sometimes sent forth from Somerset House to 'put the screw on, and a pretty state of affairs ensues. Threatening papers in red print are issued, spies are set on the trail of persons suspected of being able to pay a little more income-tax than they do, and methods are resorted to which might have been appropriate to the Middle Ages, but which are out of place in the present times. You never know if your next-door neighbour is not in league with the taxers against you. It happens constantly that he is. Your habits and customs are reported upon. You have bought a new carriage for your professional practice; you are moving to a new and bigger house, the rent of which you can ill afford, but which is necessary in order to enhance your business or professional credit; you have bought a fur coat for the winter-all these facts come to the knowledge of the tax-collector, and he arrays them against you as evidence of wealth that is leading to luxury, and he wants another hundred or two hundred pounds added to your assessed income. It is added to and added to until, in desperation, the victim appears before the Court of Inquisition, and is treated as we have seen. We heard some little time since of an authentic case in which it was established that two persons, neighbours living in adjoining houses, had been persuaded to act the spy upon each other. But happily they were led to

Is all this a truly British system, and are we to regard the machinery for the collection of the

income-tax in its present state as moral and legitimate? With such methods as these being practised daily, how can anybody expect that there shall be no resentment, no evasion, no retaliation? There is surely ample justification for them. What is it that gives such a keen edge to this espionage? The surveyors of the several districts get promotion according to their increased yields. One must be forgiven for exulting in the occasional discomfiture of the surveyors and the spies, even though it has cost the nation a trifle and there is so much more to be paid by the other taxpayers. For years a man lived in a house rented at sixty-five pounds a year, next door to that occupied by a surveyor of taxes, who regarded him as of most moderate means and accepted his statement of such a very small income as entitled him to abatement, so that his income-tax as paid was next to nothing. Then the man died, and his will was proved at two hundred and twenty thousand pounds.

Here are the faults, or some of them, of a system of tax-collection which is thoroughly repulsive to all who are subjected to it, and which can scarcely be permitted to continue. Given the desire, and a proper respect for British scruples, it ought not to be beyond the wit of legislators and officials to devise a new system which would be without so many formidable objections. And if the new system were a good one it would very likely pay handsomely for all the trouble taken in its formulation. In the meantime, one would commend these foregoing observations to our friends in France, who are just about to set up an income-tax of their own, after thinking about it for a very long time, and having been greatly worried about the prospect. It is no exaggeration to say that the chief reason why there has been no income tax in France before this is the dread which exists in the public mind against the income-tax spy; and to make the way clear for the introduction of the tax, the Minister of Finance, M. Caillaux, has found it necessary to soothe the public mind and to assure the people in speeches that there should at no time be anything in the nature of prying at houses and into private accounts. The tax shall be 'clean.' And so in due course we shall have to say that this is one more of the things that they do better in France.

HOPPY.

CHAPTER III.

TOLD you so,' said Morrison under his breath, as men and officers drew aloof. 'I felt certain that you'd get into a mess over this business. I never saw a man so savage as the

General was just when we heard the firing and I was explaining about Vare. If it had been done quietly and this poor young fellow had not been knocked out it might have been all

right, especially as you've brought your man in; but, as it is, coming on top of this awful day's work, I'm afraid you'll catch it. I'm dreadfully sorry now that I ever gave you permission to go; but you remember our compact, don't you, Hoppy? I didn't give you leave to quit your guard; you'll remember that, I know.'

'Oh, all right, colonel; don't be alarmed. Of course you didn't give me leave,' answered Hoppy

rather bitterly. 'And now I'll get on my sword again, ready to give it up, I suppose, by-and-by, when the old man has time to send for it. You'll take charge of Vare now, won't you, sir? I see he's coming round.'

Morrison, looking much relieved, called an orderly, and together they got Vare on to his feet. He did not appear much the worse for his wound, and expressed himself as quite able, with a little help, to reach the hospital and have his head properly dressed.

'But wait a moment, colonel,' he said. 'I just want to say two words to Hoppy before I go. I won't keep you long.' And, approaching his rescuer with rather unsteady steps, he said something to

him in a low voice.

'Ah, good chap that,' thought Morrison.
'Knocked half-silly as he is, he won't go away without thanking Hoppy first. I like that, by Gad!'

But the worthy man would have been considerably astonished could he have heard the little captain's speech. It was literally just two words, as he had said, and they were: 'Curse you!'

Then, rejoining the colonel, he went off with him in the direction of the hospital, leaving Hoppy staring after his slight, retreating figure with a look of incredulity upon his face, as if he found it hard to believe that any human being could be guilty of such waspish malevolence.

'Heigh-ho!' he exclaimed as he retired into the privacy of his guardroom and flung himself into a chair to obtain a little rest after his late exertions. 'It seems to me that I have got myself into rather a considerable hole. Quitted my guard without authority; disobeyed the General's personal order not to open the gate; let a crowd of niggers in, thereby causing a poor fellow's death; and created no end of a shindy in the place, right under old Ranger's nose. And for what?' he asked bitterly. 'To save the life of a miserable, illconditioned little sweep who, if he hated me before, hates me now ten times worse in consequence. V.C. irdeed!' He laughed mirthlessly as scraps of conversation from the men outside floated in through the open door, and he caught the magic letters oft repeated, mingled with such sentences as ''Oppy hall hover. Nobody but 'e could ha' brought hoff that larst 'undred yards;' and 'Dirty little hadjutant! 'e warn't worth the sweat,' &c. 'No V.C. for me. I shall consider myself lucky if I get nothing worse than a jacketing, if I know anything of the old man's temper. My sainted aunt, how he glared at me!'

'Ah! I thought as much,' he exclaimed a few minutes later. 'He hasn't been long about it. Here's the first—no, the second—act in the comedy, or tragedy I expect it will turn out to be;' and, rising hastily as the ring of spurs and clang of a scabbard trailing over the rough cobbles of the street became audible, he assumed his sword and

helmet, and prepared to receive what he had a strong presentiment would turn out to be a very unwelcome visitor.

He was not long left in doubt.

'Ah, Hoppy,' said the new-comer, who turned out to be the junior major of the Sooties, 'sorry to have to come on such an errand-deuced sorry, my boy; but-er-another fellow is coming down to take over your guard, and-er-the General's orders are that you are to consider yourself under arrest for the present. Of course it will come all right by-and-by, when the old man has cooled down a bit; but the colonel has sent me for your sword, as the adjutant's not available, and so we'd better make tracks for your quarters at once. Your relief will be here in a minute, so we can leave the sergeant in charge till he comes. I'll take the responsibility of that, and then you will escape the bother of handing over the guard before all the men, and-hang it all, old chap! you know what I mean-let's get away at once. Blow the chief for sending me on this beastly job!' muttered the good fellow feelingly, under his breath.

'Quite ready, major. Please don't mind,' cried Hoppy. 'I was expecting it, and I'm awfully sorry that you should have had the trouble of coming down here; and it's very good of you to let me down so easily.' And then, assuming as cheerful an expression of countenance as he could manage, he followed the major with such a jaunty step that none of the men sitting about on the bench outside the guardroom under the shade of the veranda suspected what had happened as they rose to salute the officers. Calling to the sergeant, the major, in half-a-dozen words, gave him his instructions, and then the two comrades strolled away side by side up the street in earnest conversation, and not one of the numerous onlookers, as they gazed admiringly at the big man who had won so terrible a race against such tremendous odds, suspected the painful relationship in which he now stood towards his companion.

The Viceroy and the Commander-in-Chief, closeted together in the former's sanctum sanctorum at Simla, were deep in an animated discussion. They sat at a large table strewn with telegrams, cipher and otherwise, books, papers, and military reports, and every now and then one or other of the great men, interrupting the conversation, would attentively study and perhaps take a note from some portentous-looking official document. Neither of them looked particularly cheerful, although a crushing defeat, with immense slaughter, inflicted on the enemy by a British force, which had taken them by surprise the day after the disaster to the column from Rhanibad, had served to lessen the gravity of the latter in the eyes of the public, and enabled the authorities, by judiciously treating the two battles as but phases of one operation, to calm, not to say successfully HOPPY. 327

hoodwink, those who pay the piper at home. True, 'Taxpayer,' 'Paterfamilias,' 'Mother of Three Soldier Sons,' &c. had, as usual, rushed into print in the hospitable columns of the Daily Telephone; but, also as usual, as we had muddled out all right in the end, the great majority were contented, and these grumblers were speedily forgotten. It was not, then, any violent explosion of indignant public opinion that was worrying the two bigwigs, but a ridiculous yet difficult question that had to be settled-namely, the conduct of an insignificant subaltern on the day of the first battle.

This young man, it appeared, had performed an act of gallantry which had been admired by the whole army, and in consequence had been recommended by his colonel as worthy of the Victoria Cross; but he also happened at the same time to have done something against the General's orders, and the latter, a stern and un-get-at-able warrior, had not only refused point-blank to forward the recommendation, but had applied to the Commander-in-Chief for leave to try the candidate by court-martial.

Of course a simple little matter like this would have been settled in ninety-nine cases out of a hundred in the General's favour, as discipline undoubtedly demanded; but the snubbed colonel of the youth's regiment, the famous and aristocratic Sooties, had set the wires in motion; and not only had two powerful newspapers taken up the cudgels in the culprit's defence, as announced in the cipher telegrams, but his father, Sir Ralph Apner, had also begun to buzz around certain great ones in England. And, worse than anything, Lord Idsworth, a very tower of political strength, whose daughter was engaged to young Apner, had threatened to go on the war-path if his prospective son-in-law was brought to trial.

'I suppose you can't try a man by court-martial and give him a V.C. at the same time and for the same thing, can you?' plaintively asked the

'Quite impossible. Make us the laughing-stock of the whole world if we did,' grunted the Commander-in-Chief irritably. 'Confound the fellow! Why didn't he get bowled over? A nice how-d'yedo we're in, with his nonsense."

The Viceroy coughed. He was a man of peace, and words and sentiments like these offended him, or he pretended they did, which came to the same

thing in the end.

'The question we have to consider,' he said quietly, a shade—only a shade—of reproof in his silken tones, 'is, what course is the safest for us to pursue in the interests of the country? If we grant the court-martial we run a grave risk at the General Election which must come presently; for Idsworth, who has long been wavering, will go over and make the reverse at Rhanibad a party cry, tacking on this matter of Apner's as a case of gross injustice as well. You know how little it needs nowadays to influence the man in the street, and a sentimental affair of this sort will interest the women, and perhaps turn the scale against us.'

'But we cannot afford to flout Ranger either; he's our coming man, you know, and-ahem !-is marked out to succeed me,' modestly remarked the Commander-in-Chief. 'Now that this matter has reached this point of publicity,' he continued, 'nothing will induce him to give way; and if we don't support him, he tells me privately that he will go; and that, when his reasons are known, will be quite as bad for your party, if not worse than Idsworth being against you. Besides, there is no doubt that he has right on his side, and that by refusing his demand for a court-martial we put ourselves completely in the wrong and lay ourselves open to all sorts of charges. No,' he went on very earnestly; 'sorry as I am for Hoppy-ah, humyoung Apner I should say; I've known him from a baby-he must, in my opinion, stand his trial for the sake of discipline; and I hope that you will look at it in that light too, and allow me to grant Ranger's application.'

The Viceroy shifted uneasily in his chair. He knew well enough that the other's arguments were sound, and that he ought to give in to them. Yet beneath that suave exterior lay that innate feeling of rivalry-always present in a greater or less degree between the civilian and the soldier-the dislike of the smooth politician to give way, even in the smaller detail, to the professional exponent of force. He was also painfully alive to the fact that, should his forebodings become realised and Lord Idsworth carry out his threat, his colleagues in the Government, from the Prime Minister downwards, would unitedly lay the blame on his shoulders if harm to the sacred 'party' came of it. Looked at from any point of view, his position was a difficult one, and it seemed to the worried statesman that, whether Ranger resigned or Idsworth made himself obnoxious, he would be held responsible in either

He turned the matter over in his mind for several minutes, and at last, looking gloomily at the waiting Commander-in-Chief, who had been watching him anxiously, with nevertheless a look of pity on his rugged features, for he quite appreciated his friend's dilemma, he exclaimed with a weary sigh, 'Well, well, have it your own way. I dare say you are right; and, after all, when you come to consider it, it's a purely military matter. Nevertheless, just at this ticklish time it may well prove the insignificant lever that shall upset the Government; in which case, of course, I should be obliged to go with them. Plague take these hot-headed young soldiers and their decoration-hunting! I hope Mr Apner will get well pitched into, although he is a friend of yours, General.'

'He'll get what he deserves; no more and no

less,' shortly replied the Commander-in-Chief; and then he gathered his numerous papers together and abruptly took his departure. 'Ugh!' he grunted as he joined his waiting military secretary in the room outside. 'These civilians, strict as they are in their private capacities, seem ready to do any job where the interests of their own political party are concerned. It was only Ranger's threat of resignation, which he knew would put him in a hole, that made his lordship do the obviously

'Pon my soul, I don't understand right thing.

'em.' 'Ouf!' exclaimed the Viceroy as the door closed behind his late visitor. 'These soldiers are the very deuce, with their pride and their rigid notions of discipline. And he's known this lad from his babyhood, too-called him Hoppy-and insists on trying him! Well, upon my word, I don't understand them.'

RAISING SUNKEN VESSELS.

By DAY ALLEN WILLEY.

HE raising of sunken vessels has become so common that steamships weighing thousands of tons have been lifted to the surface of the ocean in places where the water was so deep that their hulls were

completely submerged. The invention of the pontoon and powerful pumping machinery has made the operation practicable. It has been planned to raise a great warship from Havana harbour, however, by a method which is entirely different from the usual way of lifting vessels, for a hole must be made in the middle of the harbour in order to accomplish the feat. The undertaking brings to mind the story in the Scriptures where the waters of the Red Sea were divided, for literally they must be separated here by a great circular wall.

The harbour at Havana is one of the largest on the western continent, and is entered by ships drawing thirty feet of water and more. At the place where the hole is to be made in it the depth is about forty feet, but beneath are many feet of soft mud through which the wall-makers must penetrate in order to have their work on a solid foundation. When it is stated that this hole will be no less than three hundred and fifty feet across at its greatest diameter, and will be circular in form, a further idea of the great task involved will be obtained. But engineers who have made a careful examination say it is the only possible way by which the battleship Maine can be removed from her grave beneath the waters, and this is the reason why it has been decided to undertake the project.

By a mysterious explosion, which resulted in the destruction of the Maine and many of her crew, an opening was torn in the bottom of the battleship, causing her to sink in a few minutes to the bottom of the harbour, where she had been lying at anchor. Divers who examined the wreck say that the explosion occurred underneath the bow, and injured so much of the vessel that only by turning the part of the harbour in which she lies into dry land can the Maine ever be raised and repaired.

The plan which has been decided upon by the engineers is to build what is called a coffer-dam of

mammoth proportions. It will be a perfect circle in form, completely surrounding the sunken ship. Really the dam will consist of two, for it will be composed of an outer and an inner wall, separated from each other by about eight feet of space. This will be done in order to use the water between the walls to help to resist the pressure of the water on the outside of the dam. Each wall will be composed of stout wooden planks no less than three inches in thickness. The ends of each plank will be fitted with teeth or serrated, so that they will be joined together by what a carpenter calls a dovetail; but in addition they will be fastened by long spikes. Between the walls will be placed other timbers both directly across and in a diagonal direction, so that the top of the dam will look like a row of hour-glasses or gigantic letter X's.

One of the perplexing questions, however, is how to get a base firm enough for the dam to rest upon without allowing the water from the harbour to force its way under the walls. To provide this foundation, cribs loaded with iron rails and other heavy weights will be sunk. The cribs are hollow squares made of framework of heavy timber, merely intended to keep the ballast which will form the foundation in the proper position. They will be so heavy that they will sink through the soft mud to the clay and rock which form the solid bottom. Then divers will place more ballast on top of the cribs, so as to afford a level surface on which to set the dam. The joint between the lower part of the dam and the cribs will be covered with rows of bags filled with sand

to prevent further leakage. But the designers had to plan how to prevent the dam from being crushed by the pressure of the waters outside. Any one who is familiar with the enormous force which water exerts will know that the strengthening of the timber walls will be a most important part of the work. The dam was planned in the form of a circle because its shape will thus constitute a double arch, giving it far more resisting power than if it were built square or oblong in shape. One cubic foot of sea-water weighs a little over sixty-four pounds.

At the depth of thirty feet it is calculated that

every square foot of the outer wall will have a pressure of no less than one thousand nine hundred and twenty-nine pounds against it, or nearly one ton; but, as the pressure will be equal on all sides of the dam at this depth, the weight of the water on one side will to a certain extent counteract the weight of the water on the other side. This fact has been utilised by the engineers in their plans. While the walls will be of equal thickness from top to bottom, the bracing between them will be much stronger as the depth of water increases, so that at the bottom the timbers and bolts will be more massive and more numerous than at the top. If a framework could be built across the space enclosed by the dam, it would, of course, be greatly strengthened; but the battleship takes up so much room that it is impossible to do this, so a structure must be built which will be strong enough to keep out the sea without any interior aid.

After the dam is completed the next step will be to make the hole inside. Of course this must be done by removing the water with powerful steam-punpa. As the Maine takes up considerable space, so much water will have to be taken out that this part of the undertaking will be by no means small, yet it will be the least difficult of any portion of the work. When

the water has been lowered sufficiently, a timber framework will be placed beneath the wrecked ship, for it is intended to repair the Maine so that she can be floated and taken from port to port in the United States, to be exhibited as a sort of memorial museum. The machinery in the vessel alone cost nearly a million dollars. It is believed much of this can be again utilised. Parts of the equipment are to be made into souvenirs of brass, bronze, and copper, and sold to relic-hunters. After the ship has been exhibited in the various cities of the United States, if she can be repaired sufficiently for service she may be sold and again take her place as one of the battleships of the sea. But the armour-plate of the Maine is believed to be worth the outlay to be spent in raising her, as when new it cost no less than five hundred dollars a ton, being harveyised steel. In short, the company who has secured permission from the Cuban Government to remove the vessel from the harbour believes that it will be able to get back the whole expense of the operation, as the Maine originally cost no less than five million dollars to build and equip. The engineers estimate that fully one-fifth of this sum must be expended in making this great hole in the sea and pumping out the water about the wreck.

THE BRIDGE-WARDEN.

By Owen Oliver.

PART I

WAS born in the wardhouse overlooking the narrow bridge of gray stone that spans the Loar; and the nurse—so she often said—carried me straight to the window to look out

ship of the bridge had been in the family for two hundred years, since six of my ancestors fell there covering the retreat of their king, who, with royal gratitude, had granted to John Rix, whose name I bear, and to his lineal descendants, the right to take toll of all who passed so long as the bridge stood.

Old age had come upon it in my day, and it was held together rather by the weight of the stones, and the moss and weeds which clung round them and filled their joints, than by the crumbling mortar. Often, as a boy, I watched awesomely as it shook in the winter wind; and it trembled whenever a carriage passed. There was room for this and no more, for I could hold a hand over each side at once when full grown (being a large man). It seemed strange, indeed, that it had endured so long, for it stretched seventy feet from one sheer bank to the other, supported only by two warped stone piers; but I deemed it would last my time, and never doubted to take toll, in my graybeard age, as my forefathers had done. It was a liveli-

hood for a man and his family, for there was traffic to and from the coast, and the fords were many miles round, and impassable in the rainy seasons of the year.

There was a time, however, when I was like to forfeit my privilege. My mother-God rest her !died when I came, and my father scarce forgave me to the end for costing him so dear; and since he showed small pleasure in my company, and great impatience of my youthful freaks and follies, I left home when a lad and took service in the wars in France. I rose to be captain of a company of mercenaries, and dreamed, as boys do, of rising to be a great leader. But my soldiercraft lay in my arm rather than in my head; and, coming to the wiser age of thirty, I judged my chances of further advancement but small. So, thinking it better to sit at the bridge than to march in the field, I claimed my discharge, and, taking such moneys as were due to me-I was never unthrifty-made my way home.

I returned none too soon; for my father had died some months before, and I found a crafty knave of a scrivener installed in my house, pleading leave and license of the Lady of Eastlake, who had lately come of age and been freed from warlship, and ruled the lands between the river and the sea.

The man could not look me fairly in the eyes; but he drew out a long roll of parchment and read many outlandish phrases that were neither English nor French, and argued his rights with much citation of the law till I pricked him with the point of my sword. Then he fled, shricking as if all the fiends were after him, and threatening me with the wrath of his patroness.

The lady herself rode out with a following the next morning to demand the house from me, and rated me with many angry words. A tall, headstrong maid she was, and one to gladden a soldier's

I heard her in patience, knowing that a woman's eyes. tongue must run, until her breath seemed ex-Then I told her calmly that by the King's gift the wardenship of the bridge was mine, and the right to take toll from those who passed thereon; and she had no power to grant leave or license otherwise. 'Unless,' I concluded courteously, 'you can show me warrant, madam.'

'Warrant!' She tossed back her hair and turned a little to the men-at-arms. 'My warrant is easy to

'I am a poor scholar, madam,' I answered; 'for I read.' can read nothing there to set aside the King's word; and I will move from here for no other.'

She tossed back her hair again, which was a trick

'Your blood be upon your own head,' she cried, if you are foolhardy enough to resist a

'Nay, madam,' I said, 'upon yours, since you would set twenty men upon one who but holds his own,

She bit her lip and hesitated; for a woman is swift of speech but slow to action, and I think her heart was softer than her words. But her men began to move in upon me, and I drew my sword sharply. The flash of the steel frightened her steed, and suddenly he reared and threw his mistress. I dropped my sword to catch her, and staggered against the doorway with her in my arms. Then I set her courteously upon the ground. Her men would have seized me unarmed, but she turned and drove them back and stamped her

'Fie!' she cried. 'Fie! He has dropped his sword to aid me!' Then she turned to me and bowed. Zounds! she was a fair maid.

- 'I have no mind to set twenty on one, Master John Rix, she said, even were it not that I owe you some thanks for saving me from the stones. They tell me that you have fought in the wars and gained much honour.'
 - 'I fought in the wars, madam,' I told her.
 - What rank held you?
 - 'I was captain of a company.'
 - 'Will you take my service, and be captain of four ?'
 - 'You honour me greatly, madam,' I replied; 'but I am weary of serving.'

She looked at me under her eyelashes; and a woman's eyes have won more soldiers than all the silver of the King.

·

'Would my service be so irksome to you, sir?' she 'It would be pleasant service,' I vowed, 'but asked.

She laughed merrily. 'Think you to dangerous. Why?

lose your head in it?' 'My hand can guard my head,' I answered; 'but

there is no guard for my heart. Therein I spoke lightly, thinking a compliment, even to so great a lady, not amiss. Yet by accident

I touched the truth. The lady tried vainly to frown down my boldness, but laughed outright at last.

'Keep your heart,' she said, shrugging her shoulders, 'and your tottering bridge; but I will pay no toll when I pass.'

'My eyes will take toll every time,' I answered boldly, forgetting too much the difference in our

She glanced hotly at me for a moment, and gave degree. herself a haughty shake; but she spoke no more till I had helped her to mount and she was riding away. Then she bent down from her saddle and whispered quietly:

'I will take toll of you, Master Rix, before I have done. Every dog has his day, and this is

'You speak truly, madam,' I whispered, as softly yours; but'-To-day I have held the world in my as she. arms.'

She flushed like a fire that is fanned, and gave her horse the spur; and I stood bareheaded, looking

'So,' I mused, 'my tongue has run too far; after her. and it is war between us, my proud lady! I am like to fare the worse; but you will remember that John Rix the bridge-warden held you in his arms. What a maid of maids it is!'

I held counsel with myself how the lady would seek her revenge on me; and it seemed likely that she would take occasion of some error of mine to lay a case before the King to deprive me of my wardenship. So I was wary in my doings and gave offence to none. But when I came to know her I found that I had judged her wrongfully, since she was above all underhand doings. So next I thought that she spoke without intent, as woman will, and would have no revenge at all on me. But she stopped whenever she rode my way unattended—and that was often—and greeted me fairly, and spoke with me as with an equal, laughing and looking at me with her great eyes, and displaying many little airs and graces; and then it dawned on my slow understanding that she would take her toll in another way, with a woman's weapons; and pay I must, and pay I did in many a peevish day and restless night. Yet I concealed my vanquishment from her, and looked her fairly in the face, and answered her speech like one heart-free, lest she should laugh me to scorn.

'The King bids me to Court to find a husband,' she told me, glancing to see if I winced. 'What think you, Master John?'

'That if you tarry too long the King will find a husband for you,' I answered.

'Even so he vows,' she said; 'but it seems that none will dare.'

'It needs daring, madam,' I answered, shrugging my shoulders. 'But there are some who lack the wisdom to fear, and one will come riding over my bridge some day.'

'And then?' She smiled at me.

'And then-I shall take toll of him.' I slapped my pocket till the coins jingled.

'If he is bold enough to come for me without my leave,' she declared, 'he will be bold enough to pass without yours.'

'If he is bold enough to pass without my leave,' I retorted, 'he is bold enough to take you without

'Truly,' she vowed, 'that would need a braver man than you, Master John.'

I contradicted her not, believing that she tried to tempt me to my downfall, and having no mind to give her occasion to laugh my presumptuous folly to scorn. Though I doubted that the event would find her nearer to tears than laughter. For she was a true-hearted maid, her wilfulness withal, and when she had won her revenge, would think less of her victory than of my hurt, and be like to blame herself for playing with me. Sometimes I was minded to be open and tell her so; but then I knew she would come my way no more, and, poor love sick fool that I was! the day had no light unless I saw her. So I piqued her still that she might come; and, since she permitted me to speak fankly with her, I advised her concerning her marriage as a friend to whom her welfare was dear, and especially that she did unwisely to flout

'A great lady like you must marry,' I said, 'and have a husband to rule her lands, and heirs to govern them after her. Among the nobles of the Court there may be some whom you would like well, and a wilful maid makes often a willing

'I will make none,' she cried hotly.

'It is worse to be an unwilling one, and if you try the King too long he may send you a husband little to your liking.'

'Then I will send him back again.' She drew herself up hotly. 'I have four hundred good men to hasten him on his way, and perhaps one more. For you would take my service then, Master

'Nay, madam,' I answered. 'My service would not profit you, and I am grown too old to fight a

Then she grew angry, and cried that I was a coward, and she wanted none in her service; and touched her horse with the spur and rode away, leaping the hedges and brooks in her reckless

Toward the end of the summer there came across my bridge a messenger from London, a lusty man with a fearless voice and a soldier's bearing; and I saw on his wallet the royal arms. He paid treble toll and took no change, and asked the road to my lady's castle; and my mind misgave me. It misgave me more when he returned, looking angrily and biting his moustache; and as he flung me a coin he cried that he would pay no toll when next he came my way. So I judged that he thought to return with the King's army, which passes free.

The next morning I was early at my door, looking for my lady, and not in vain.

She was flushed with riding fast, and could scarce stop her steed till I caught at the bridle. 'It will gladden your heart to know that you

will take your toll soon,' she cried, tossing back her hair.

I steadied my look and voice with difficulty.

'It is as it should be, lady,' I said, 'if he is a good man and worthy of you.

'That might easily be,' she said, with a bitterness in her voice, 'as you think of me. But even you will scarce think so of-the Earl of Lanby.' She looked across the river, where his earldom lay as far as the eye could see.

'The Earl of Lanby!' I grated my teeth for a moment; for the Earl was well at fighting, and ill at all else. 'I have been a soldier, lady, and drilled to hold that the King can work no evil; else I had said that he has done you grievous wrong.'

'The wrong is not yet done,' she cried. 'I will defy the King; and now, will you serve me, John ?'

I leaned one arm upon her horse and stared across the narrow gray bridge, and seemed to see myself and a few good men holding it against the army; but I saw them, in my mind's eye, surrounding us by the fords and taking us in the rear, and myself hanged—that mattered not—and her men; and I shook my head.

'My life is little to me, madam,' I said, 'if it would profit you; but it would not. You will but add to your bitterness the humiliation of defeat. Neither will I ask your men to follow me in so hopeless a cause. You cannot resist the King.

'Do I care so little for my brave men-or for you?'she cried. 'Ask them to follow you-and me -across the water. Discipline them into soldiers worthy of the acceptance of the King of France. They would fain serve under you, John; for they say that you are a good soldier, and that there is no swordsman like you in France.

I had, indeed, some skill with the weapon, and her men-at-arms loved to learn from me.

She smiled down at me as she sat on her horse;

and I was sore tempted, but steeled my heart against her wiles.

'No, madam,' I answered. 'I am yours to the death if I can render you useful service; but I will not serve the enemies of my King.'

She swerved her horse aside, pulling angrily at the rein.

'You are a poltroon,' she cried—'a poor knave with no mind above taking toll at your bridge. Come against me with the army of your King!' And with that she was gone.

I stood gloomily looking after her till she was out of sight; then I walked out upon the bridge and sat upon the parapet, staring moodily at the

water and communing with myself.

I was ready enough to fight for her, even against the King, if that would save her from a distasteful marriage—for the thought that I would not have her love her husband I dismissed as unworthy; but this was beyond my power; and even if I refused service against my countrymen, I saw no profit in following her to France. Since my presumptuous love for her grew every day, I should but increase my tortures by seeing her, and at the end should dance at her marriage with some finnicking French nobleman whom I could stifle with one arm. To France, I resolved firmly, I would not go.

There was only one way in which I could free her from the need of flight to escape this hateful marriage. If I could meet the Earl and kill him! They would kill me afterwards; but that would not matter, for life held nothing but trouble for me since she was out of my reach. But I could not bring myself to so unsoldierly a deed as to take him unaware, and he would disdain single combat with one of my degree. Indeed, they would thrust me from his doors if I sought audience of him.

I pondered all day upon the matter, and, thinking still of it at night, I could not sleep. So I rose and dressed, and went out on the bridge and rested my arms on the parapet and looked down on the river hurrying by. There had been a storm in the evening, and the wreckage of the trees raced down the stream, and sometimes a great bough struck one of the slender piers and made the bridge tremble. The wind blew fiercely towards Lanby, and the keen air and the cold moon peeping through the scurrying clouds chilled my hot passion to a pensive mood.

I had stood there a while when I heard, beyond the far end of the bridge, a sound that I knew. I should have recognised it before but for the contrary wind. It was the thud of horses at a trot—horses

that were ridden in close order together.

I thought with a quickness unusual to me—though my wits are apt to wake at times of action—it could not be the King's army, for the messenger had barely returned. It must be the crafty Earl coming with a force to seize my lady ere she fled to France, as one might well judge she was like to do. There was no time to run back and saddle my mare to give warning. I could but die for her.

(To be continued.)

A NEW AUTOMATIC RAILWAY COUPLING.

By J. E. WHITBY.

HE question of automatic railway coupling is one that has long been recognised by all civilised nations as of vital importance; and the news, therefore, that a Belgian inventor has surmounted the difficulties hitherto

met in producing a perfect apparatus is of the greatest interest to all.

The absolute necessity for doing away with the dangerous practice of hand-coupling railway cars is freely admitted, and America has legislated against it; but the actual invention which should assure absolute security to the life and limb of railway servants, that would minimise labour, and effect a saving in the wear and tear of rolling stock, while relieving railway companies of the expense of pensions and compensation sums in case of accident—this perfect invention had yet to be produced.

Now, however, Belgium claims to have a perfect automatic coupler ready for use. For some time experiments have been going on at the railway siding of Ghent-Terneuzen, where the engineer-in-

chief has greatly perfected the machine; and tests that would seem to prove that the great question is solved at last have been taking place at the Government railway works at Ghent.

The experiments are actually the result of a discussion in the Belgian Chamber of Deputies on the immediate necessity for legislation with regard to automatic coupling, and this special invention was mentioned as meeting all requirements. Further, it has been carefully examined by the Belgian Technical Commission in committee for the Government, which pronounced in its favour, saying 'nothing now remains but to put it into practice,' and expressing perfect confidence in the result. And in this idea they are supported by the advantages possessed by the Belgian system over all those inventions hitherto presented; these being its simplicity, its cheapness, and the fact that it is simply an addition to the car or wagon as it stands, requiring no remodelling or alteration in the frame, a matter of great moment to railway companies. For were it necessary to have fresh cars and wagons made, an immediate heavy outlay would be unavoidable before which any company might shrink when remembering its shareholders; and, moreover, traffic would be so disorganised while the adoption of the new cars was taking place as to assure further heavy loss. This is one of the drawbacks to the model adopted in America, in which the buffers are entirely removed or placed in the centre.

That, indeed, was one of the chief difficulties to be grappled with by the inventor, M. de Vlieger, who, it may be mentioned, is a distinct embodiment of the old saying, 'a round peg in a square hole.' Nature built his brain for an engineer, but the circumstances of his parents were against his being educated for that calling, and, like many another lad, he had to take up a somewhat uncongenial occupation. But despite the fact that he has risen, like the Egyptian in the time of Pharaoh, to the post of 'chief baker,' being actually the Court baker in Brussels, and possessing a fine business, he has spent every spare moment in inventing all kinds of things, from a new sort of braces for men's greater comfort in wear to the automatic railway coupler under consideration, which it is believed will save thousands of lives annually by doing away with hand-coupling by railway servants. The enormous loss of life and the great suffering entailed by the present system weighed on the mind of M. de Vlieger, and he set himself to invent some piece of machinery that should meet the difficulty.

Just at that moment Russia offered a very large prize for such an invention, and M. de Vlieger was one of those who sent in suggestions. Unfortunately, the sudden and disastrous opening of the Japanese war threw the idea into the shade, and nothing more was heard of the competition. Four of the plans, however, came into the hands of the Belgian Government, and of these, three have been eliminated, leaving only that of M. de Vlieger for the final experiments. As with all inventions made by men not practical engineers, certain alterations have had to be made in the original designs, and these have been made by F. von Balluscoh's patents.

Roughly speaking, the idea is that of a hook and eye, one of each being placed at the end of every car, so that the hook always meets the eye, and the coupling is, therefore, double. Both are jointed so as to allow of play at curves, the contrivance being placed between the buffers and at the same height.

It may be said, further to explain the action of the coupler, that the 'eye' is in reality an inclined plane, smaller at the top, slotted, and with that heavy turned-over border known as a flange. The hook, with its flat, square head, is pushed up the incline by the very slightest touch, and falls over a bolt, where it is securely held by the heavy flange until uncoupling is desired. No supervision is needed for coupling, the machine acting with the

most gentle advance of wagon to wagon as well as by a more sudden impact; and uncoupling is quite as simple, requiring only one man outside the wagon. He releases the bolt with one hand, thus allowing the hook to drop between the slots of the 'eye' nearest to him, and with the other pulls a chain attached to a lever that releases the bolt on the opposite side. One of the great advantages of the Belgian system, also, is that coupling can easily be done at curves, and both couplers act effectively on a curve of two hundred and thirty feet, the stiffest curve to be met with on railway lines. Indeed, during the tests an attempt was made to join fifteen-ton wagons on a curve of one hundred and fifteen feet used merely to send damaged cars to the workshop. Even here one coupler acted perfectly, and the second took up its work immediately the locomotive had moved to a slightly less severe bend. Meanwhile it was found impossible to couple at all by the hand-system in present use with such a radius.

The inventors of this boon to mankind have realised that it will be difficult to adopt the system all at once, and the old-fashioned hook still remains in the centre of the Belgian contrivance, while the chains also are left. The Belgian hook and eye can be lifted out of the way under bars when an up-to-date wagon meets one behind the times, and this, of course, will allow the railway companies to adopt the Belgian plan by degrees.

There is no doubt that the invention will confer a great boon on humanity, for it will not only do away with the risks to railway servants, but ensure greater comfort to passengers, for the tightening of the coupling, making for less oscillation with passenger trains, is so well arranged by means of side-winders that the movement is of the slightest. In addition to this, the saving in the wear and tear of railway material will be enormous, for it will be no longer necessary to drive cars heavily together to secure a coupling which is not only double, and therefore far stronger, but which requires no supervision, and is absolutely incapable of becoming undone.

This invention now only needs the final seal of approbation of the International Railway Congress, before which the Belgian Government will lay it when the time arrives. We understand that the coupling is to be definitely adopted by the Belgian Government. When it is remembered that in Great Britain alone one hundred and twelve railway men came by their deaths during three years, and that forty thousand were injured by being compelled to work at the hand-coupling of railway cars, every one will be glad to learn that there will be no future need of risk of such frightful accidents. It is interesting to remember that Belgium, which is presenting the world with this inestimable blessing, was the first nation on the Continent to adopt railways

'I CANNOT LOVE A COWARD, BY MY FAITH!'

By F. G. AFLALO.

I hate a coward !'

As Olga stood before them with this passionate declaration, an uncomfortable hush fell on the party. Her old father, who had just been setting the chess-table for silent

battle with his son-in-law elect, knocked over three pawns, a bishop, and a snuff-box, the last with disastrous results. Her young sister was glad of the excuse afforded by the too aromatic cloud that filled the air, for had she not sneezed she must have screamed. Geoffrey Larbalestier, whose pale complexion and stooping shoulders told of the scientific student in great cities, stood self-confessed, unwilling or unable to defend the part he had played in the confession that had elicited Olga's maidenly indignation.

It had not been a very romantic story; yet, told as he alone could have told it, there was no lack of human interest even though the mise en scène were the Malebolgian atmosphere of the District Railway before electricity had been called in to purify its tunnels. They had been discussing heroism, and particularly that form of it which inspired disregard for danger in face of sudden emergency. Olga, who held strong views on the subject of physical courage, and who had somehow, though at no apparent sacrifice, earned among her little circle the reputation of a 'dame sans paour'-she liked the old French spelling as suggesting a Bayard in petticoats—had asserted her conviction that courage lurked where least suspected; and she laughingly declared that even Geoffrey, torn suddenly from his beloved microscope, would find himself doing deeds of daring if only the occasion should arise. For herself, her one regret was that unkind fate sent no chance of proving her superiority to vulgar fear.

Her opinion struck some answering chord in the man she had promised to marry a month hence; and, with a fearlessness that he had hardly during the last few hours given himself credit for, he had held up his head and told in straight and manly language, and without attempt at exculpation, a little experience of that afternoon which at once proved and disproved her theory—proved it for the type, disproved it for the individual.

After a hard day's research-work with the microscope at South Kensington, he had paced the platform of the District station, wrapped in smoky fog and far from the crowd which gathered round the brighter illumination of the bookstall. The only other individual in sight was a gigantic labourer in corduroys, holding by a string a mongrel cur, in which none of three types predominated. The

poor beast bore marks of starvation and neglect, but had the great appealing eyes and almost human expression, the expression in which some one has recognised the missing of a soul, often more noticeable in mongrels than in dogs of breed. As if conscious of impending doom, this canine derelict whimpered in the murky darkness, and of a sudden turned on the man and feebly, half-heartedly bit him in the leg. The human brute, who through his coarse hide could scarcely have felt so slight a token of hostility, made use of a filthy expression and kicked the poor little beast in the side with such violence that, as he had loosed his hold of the string at its collar, sent it off the platform.

It all happened in the drawing of a breath, and at the same instant the signal-light changed colour and a distant boom, with a rush of smoke from the tunnel, told that the train was near. The little dog dragged itself between the metals and whimpered feebly. Geoffrey expostulated with the man, and received blasphemous counsel in return, with the information that, if he liked to pull the dog out of danger, he could call it his own. To jump off the platform and carry the poor little brute out of danger could, if done at once, entail very But a delay of more than two or little risk. three seconds might be fatal. Geoffrey made a step towards the edge of the platform; and the brute beside him, knowing him apparently better than he knew himself, laughed cynically.

'Go it, toff, and ye'll get the bloomin' V.C.'

Geoffrey did not get beyond the edge.

'Wot! funk it? Well, I'm blowed! 'Ere goes, anyway.'

Without a moment's hesitation, the man who had just sent a dog to its death without a qualm leapt in front of the advancing lights, caught the dog by the scruff of its neck, and just flung himself forward as the cry of 'Stand back!' came from both sides of the station. Amid the cheers of the crowd, which saw only the heroism and knew nothing of the prelude, the man and his charge were dragged from under the locomotive, the man with a crushed leg and unconscious, the dog still whimpering, but otherwise unhurt.

And Geoffrey, who had chided, yet had not the courage to act, shrank in abasement in a corner of an empty compartment, feeling that the very faces in the advertisements of perfect soaps and patent foods were laughing at his want of spirit.

So he had told his story.

'No,' was Olga's next remark, 'I could never trust myself. I would rather marry your workman!'

'Really, Olga,' was the old man's remark, 'you

are like a tragedy queen. How do you know that you would have done otherwise?'

'I am sorry, papa, but I could not keep my promise to Geoffrey after what he has told us."

Quietly, and with a touch of the dramatic style which came from a grandmother who had once charmed Petersburg with her acting, she drew the half-hoop from her finger and laid it on the table beside the chess-board.

Geoffrey, who had said nothing since telling his story, now protested, though only in a self-deprecating fashion, as if conscious that he deserved no

'Surely, Olga, this is not the end?'

'It is the end, Geoffrey.'

She left the room, and Geoffrey shrugged his shoulders and then left the house.

Next afternoon Olga Varley descended from the omnibus opposite her favourite tea-shop and walked quickly down the side-street which led to the British Museum, where she was engaged on some of the lighter literary cribbage by which many young ladies supplement their dress allowance, spending their earnings, which their poorer sisters devote to bread and butter, on smart hats and other aids to the unnatural selection which culminates in matrimony. A bright spot burned on either cheek, not so much from the recollection of her renunciation of last night as because of the news and map-shots in that morning's Daily Error, a copy of which was clenched in her little hand. It contained sensational pictures of the latest bomb outrage in Moscow, the real object of which, a Grand Duke, had escaped without a scratch, while the victims were an aged general, a little child, and the per-Petrator herself, a young woman who but the day before had been the toast of the students. Olga's veins ran Russian blood. Her name had been borne by five generations of a Petersburg family well known in dramatic and literary circles, and inherited poison was distilled in her mind. She saw nothing dastardly in the abortive attempt on a tyrant's life, nothing appropriate in the retribution. Dynamite for autocrats was her motto; she envied Anna Karenina, whose mangled remains now awaited burial by the police, and felt that she too, in other circumstances, might have been a heroine if fate had not made her a writer of blameless fiction.

Full of resentment at so prosaic a destiny, she walked past the porters at the gate with her head high in the air, past the strutting pigeons in the courtyard, for which she had always had a word and sometimes even a crumb, and so through the

The Rotunda of the British Museum may be conducive to study, but, lacking the bright decoration of its fellow at Washington, it is not enliven-

Those who frequent it are in keeping with the building, and there is about them a remarkable homogeneity, the indefinable quality of men and women who crowd there bent on one purpose. The dead, who knew how to write, are exhumed by the living, who do not.

Olga, who wanted some notes on a period of Russian history, on the unsavoury fabric of which she was raising an unpretentious shocker of Nihilism and fierce Tartar amours, threw her gloves down on the blotting-pad of I 18, one of several vacant seats near the swing glass-doors, and turned up her nose at a mild-eyed Oriental, who stared with Persian admiration at his smart neighbour through high-power glasses that had, for want of more alluring occupation, been focussed on a frivolous tome concerned with the hieratic ostraka and papyri.

Having thus retained I 18 for her own beheat, Olga went to the centre of the room to write out some fresh slips from the catalogues, after which she deposited them in the basket and returned to her place with a volume of an Encyclopædia to while away the interval until the long-suffering attendant should bring some, at any rate, of her desiderata.

Then she glanced abstractedly through the proofs of her last instalment in The Woman at Large, the thrilling scene in which the English governess rushed back into a burning château on the Neva and rescued the crippled child of a Nihilist exiled to Siberia, whom she was eventually, when the stipulated hundred and fifty thousand words were approaching completion, to wed in romantic circumstances not yet fully evolved.

Suddenly she realised that I 17 was no longer empty, but was occupied by what at first sight looked like the back-view of the late Sir Henry Irving as Othello. The individual, who gave but slight promise of beauty on nearer inspection, pushed a little paper parcel to the back of the desk, covered it over with a black velvet cloth like that used by photographers anxious to shut out all worldly distraction from their eye when focussing on a ground-glass plate, and suddenly turned to look up at the gallery. Olga gazed with extraordinary fascination on the face, not so much because it resembled that which the Man in the Iron Mask of her imaginings would have disclosed had he been permitted, as for the undoubted identity which it betrayed with a famous anarchist refugee badly wanted by the Italian police. The man was certainly starving, and probably insane. The skin was the colour of parchment; the eyes burned with the fires of great, perhaps fearful, purposes; a goatlike beard, depending below hollow cheekbones, lent a touch of the satyr. On his far-off gaze the spectacle of a goodlooking young woman staring at him, her lips parted, her breath held in suspense, had no more effect than had she been a windmill. Even as she looked, unable to avert her eyes from a face

1

that she had last seen in the weekly illustrated papers on the occasion of the failure of a demand for the owner's extradition, the man, muttering audibly, though unintelligibly, to himself, pushed back his chair and passed out through the doors, leaving the black bag covered by the black cloth on the desk.

Disturbed by this apparition, and relieved more than she could say by its removal, Olga opened the Encyclopædia at the article that interested her, and tried, as mechanically she turned the pages, to concentrate her thoughts upon the subject. Subconsciously she heard the ticking of the clock, rhythmic, insistent, dominating. Of the clock? But had she ever before heard anything of the Museum clock but its striking? With a cold thrill down her spine, she looked up, and slowly, irresistibly, her eyes followed the direction of the sound until they rested on the black cloth. The ticking came from inside the parcel! Beads of perspiration started on her white brow; in the porches of her ears was that curious buzzing which we associate with crises great and small, with the passing of a valued life or a visit to the dentist. Where now were her heroics? Where her contempt of Geoffrey? Where her yearning for the martyr's crown? For here, she never doubted it, lay an internal machine timed to wreck that fane of priceless treasures and to mangle all those poor studious sheep as soon as the mad miscreant who left it there had got clear of the neighbourhood. Oh! to blow up autocrats and grand dukes and chiefs of police was a hero's mission, but to wreak such blind vengeance on the unoffending crowd of dullards copying wisdom that other dullards might read was the vile crime of an Ishmael inspired by madness.

She would seize the bag and rush with it to the attendants at the gate. She, no doubt, would perish in the attempt; but the Museum would be saved, and Geoffrey would ponder-as he contemplated her last photograph (a becoming one by Alice Hughes) in the Sphere and Sketch, which enshrine in their weekly Valhalla some that deserve honour and others that do not-the justice of her refusal of him. Should she hesitate, with the way so clear before her? She did not. She fled hurriedly from the room, but without the parcel; left her gloves beside the open Encyclopædia, and on the next desk left that dread something ticking away the lives of men. Once outside the gates, within which she had behaved circumspectly like a criminal cunning to avoid capture, she ran until she was on the footboard of an omnibus bound east. Her heart beat violently; every moment she expected to hear the death-roar of the national library. She did not come out of her trance until the bus was delayed at the top of Cheapside. Then curiosity got the better of discretion. She was, after all, of the same sex as Lot's wife, and must look back even if the city were burning. She got down, and clambered on the roof of another bus going west. The air seemed charged with dynamite. Cockney newsboys

were bawling the headlines of a fresh outrage at Odessa. Olga glanced furtively at the sky ahead, and for a moment her heart stopped beating. Then, with a sickly smile at her own fears, she realised that she had mistaken the good-night rally of the winter sun for the reflection of a great blaze.

A few minutes later she alighted opposite Mudies'. There was no crowd. The Museum was still intact. Evidently the blow had yet to fall, but for the life of her she could not run away, but felt herself drawn by an irresistible force within the building. Through the glass doors she peered, and there sat the Italian poring peacefully over a great volume on the reading-slope. Beside him, half-covered by the baneful cloth, was one of those cheap alarumclocks which wake domestic drudges from dreams in which they walk in the ermine of duchesses. Olga felt a catch at the throat. Thank Heaven! none had known of her stupid mistake, and she might still preserve her respect and reputation as an unrecognised heroine. Not, like Geoffrey, would she tell them all of her miserable cowardice. She could still hold up her head. But could she?

That night she went early to her room and wrote a long letter, pausing now and then as if she would throw it in the fire that burned brightly in the hearth, but going resolutely to the end. Then she addressed it to Geoffrey's chambers, and went out to post it herself in the pillar at the corner.

Next morning the family was still at breakfast when the bell rang with no uncertain summons. Olga, her face flooding with colour, left the table and went to the door.

'Oh, Geoffrey!'

Well, dear, it seems that we are a pair.

Geoffrey, can you ever forgive me? Geoffrey could.

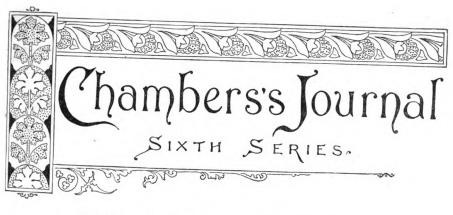

IN THE OFFING.

FAR out, where white sails dip and lift Their swelling bosoms on the verge Of waters, there's a ship that waves A sunlit sail all day.

Her helm has taught her many a shift; Still far to sea that ship delays, Rapt in a dreamy summer haze, And gains no length of way.

She cannot catch a breeze to urge Her landward ere the day is done; But with the setting of the sun She's glorified, and like a star Her masthead flashes from afar This thought to me:

'Thus souls upon the swelling sea Of Song and Passion miss the gift Of words, that pass them winging swift; So on the verge of silence drift With dip and lift.' D. CARROLL.

THE HEART OF THINGS.

By HENRY LEACH.

[All Rights Reserved.]

LONDON, April 20, 1907.

T as at the annual exhibition of the Royal Academy comes to claim the general attention at the beginning of the month of May, and the men who make the exhibition have been wondering anxiously for a long time

past whether this year at last, now that there are some signs that the country has a little more money to spend on the things that give pleasure to the cultured taste, some encouragement will be given to them, for they have had many bad seasons in succession. They looked forward with some hope to last year's exhibition at Burlington House; but they were disappointed, for there was no recovery from the stagnant position into which the commercial side of art has fallen in late years. The bad time set in at its worst when the Boer war came, with all its heavy cost, and the immediate disposition of the people in consequence was to confine their purchases to what they described as necessities. So they got out of the habit of picture buying, and the artists had to cut their expenses down most severely. Then, when the war was over and there was money to spend again, the motor-car craze swept over the country, and everybody who was anybody, or wished to be considered somebody, felt it incumbent on him to expend near a thousand pounds on a carriage that would go by petrol instead of by horses. It would do him much good to go out into the country, he said, and would be a great convenience, and the money could be saved in divers ways. For instance, one could go without new pictures, which, after all, were rather expensive luxuries. So, what with one thing and another, the people who used regularly to buy good pictures, and to pay good prices for them, have rather fallen out of the habit. In this queer age we seem to want something more exciting and novel than art. The men who make books can and do adapt themselves business placed provisionally on the line, but may in a large measure to the peculiar and changing be removed from there before the places are finally idiosyncrasies of the public taste; but it is harder determined for no other reason than that they do for the artists to do so, and if they attempted any not fit properly. There is no greater delusion than No. 491.-Vol. X. that the pictures which are on the line are in all

considerable measure of such enterprise it is likely that the percentage of rejections by the Academy would increase from the already discouragingly high figure of 85. Nearly twelve thousand pictures are sent in by ambitious artists every year, and of these only some fifteen hundred by non-members and two hundred by members are kept for exhibition. So it is well said that the Academy is not what it used to be, and those most immediately concerned wonder whether the really happy days will ever come again in such a complicated age as this.

It may not be generally known what a veritable

hive of industry Burlington House has been all

through this month of April. It is the busiest month of the whole year in this temple of art, for it is the month in which the exhibition is made. Vans and vans by the score deliver the pictures sent by the aspirants by the end of March, and the forty Academicians constituting the Selection Committee sit there through the early days of April gradually reducing the number of pictures until they have just got enough for the walls. They meet each morning of the first week in one of the large rooms, the President sitting in the middle of the group, while a large army of porters carry the pictures in one by one and rest them for a while before the court. At its first consideration that court has three decisions open to it, represented by the letters A, D, and X, one of which is applied to the picture as it is moved away. A majority get the sign of the X straight away, which means that they are rejected and can go back whence they came. When a picture is so good that there is no possible doubt about its inclusion in the exhibition it gets the A mark, and those of which the merit is so obvious are at the beginning of the hanging

APRIL 27, 1907.

cases supposed to have more merit than those which are up above. A frame that is an inch too big may result in the picture which it encloses being sent up from the place on the line for which it was a candidate to another right up on the top. The D mark stands for doubtful, and those marked thus are the pictures which give most trouble to the selectors, since many of them have to be brought up two or three times for examination. Artists know from the shape of the envelope that encloses the letter from the Academy authorities what their fate is. The court-shaped one contains an invitation to remove the picture as soon as possible, and the oblong shape tells of acceptance and the need to repair to Burlington House quickly to put the last touches to the work. Then comes varnishing-day and the private viewing, and as soon as the latter is over Room III. is converted into a banqueting hall, and the Academy dinner is held on the Saturday night.

Strange thing this Academy dinner; it is one of those delightful institutions that have taken a century and a half to mature to their present fine state. On the evening of the day on which the first exhibition was held in 1769 a dinner was given at the St Alban's Tavern in celebration of the event, and Reynolds sat in presidency over it; but it was not until two years later that the first official dinner was held at the new rooms in Somerset House, on the day before the opening of the exhibition of the year. Only twenty-five invitations were sent out, and the cost of the dinner was limited to five shillings. There were two comprehensive courses, one consisting of 'fish, fowles, roast-beef, pidgeonpye, raised pye, ham, sallad, and greens,' and the other of 'lamb, goose, ducks, asparagus, and pudding.' Port and madeira were the only wines served, and they were extras, as also were 'desert of fruit, 'strange beer,' 'olives after supper,' 'attendance by waiters,' and a few other items. About a hundred years ago there were complaints made that whereas 'the original intention of the entertainment was to bring together at the opening of the exhibition the highest orders of society and the most distinguished characters of the age, by degrees the purity of selection had given way to the influence of private friendships and the importunity of acquaintances, the rooms being most inconveniently crowded and the dignity of the feast impaired. Never after was there any cause for complaint, and to-day it is a very high honour to be bidden to the feast at Burlington House. In olden times songs used to be sung both during and after the dinner, but all that has ceased long ago, the only music now being supplied by the Royal Artillery Band, which plays the National Anthem after 'The King' has been proposed, and gives a few selections while the guests are wandering through the galleries.

A circumstance that encourages some people to the belief that there may be a revival in the patronage given to art before long is that there appears to

have been more interest than usual in the sales at Christie's this spring. Quite a little flutter was created a few weeks ago when it was told that over thirty thousand pounds' worth of business had been done on a Saturday afternoon, a Lawrence portrait at four thousand guineas and a Cuyp at only a trifle less being among the leading items. This certainly represented good bidding, and Christic's is always one of the most interesting places in London when there is such going on. Nobody who was there will forget that Saturday in May four years ago when the Vaile collection was disposed of, and pictures to the realised value of one hundred and five thousand eight hundred and forty-five pounds were hammered away. Other big sales of comparatively recent times were the James Price in 1895, which realised eighty-seven thousand one hundred and forty-four pounds; the Wells in 1890, seventy-eight thousand three hundred and twelve pounds; the Pender in 1897, seventy-five thousand nine hundred and sixteen pounds; and the Becket-Denison in 1885, which yielded seventy-one thousand and fifty pounds; while there have been several others at which business to the amount of over sixty thousand pounds has been done. There is a romance in these figures alone, and often enough there are little romances bound up with individual lots. For example, late in the afternoon of the sale of the Vaile collection, an item in the catalogue, a 'Portrait of a Young Lady' by Gainsborough, realised nine thousand guineas, and the purchase-money went to a humble home at Worthing which until just previously had not suspected what a treasure it contained. The lady of this home one day came up to London with the picture, which was in a very dirty and neglected condition, and offered it to a Bond Street dealer, who ventured to bid her a couple of pounds for it. Neither of them knew what the picture was at that time, but the lady luckily declined the offer; and very shortly afterwards, when it came to Christie's, the bidding began at two hundred guiness, and finished, as stated, at nine thousand.

When the Academy is opened, the London season, with all its life and colour, must be reckoned as fairly begun, and there is every indication that from the fashionable point of view it will be as good a season as ever there has been. Whatever may be the shortage of money for other purposes, it is rarely that the men of the 'smart set' pinch their womenkind in the matter of dress when the latter are dependent upon them. They will tell you in Bond Street that, so far from there being the slightest evidence that the doctrine of the simple life is gaining in favour in the showy circles, it is all the other way; and it is not long since Mr Redfern, of the famous firm in Bond Street, when tackled upon the question, confessed that he could see nothing out of the way in a first-class English society lady spending a matter of nine thousand

pounds a year on her dress alone, and he considered one thousand pounds a proper amount for such a lady to spend in lingerie, and one thousand pounds in furs. In France such a lady, he declared, would spend not nine thousand pounds but twenty thousand pounds a year. It is very—what shall we say? -wonderful; and not the least wonderful part of it is that for weeks and months past many acute scientific minds have been hard at work in the attempt to solve problems of which my lady is to have the benefit this season in the Park, and at Henley, Ascot, Goodwood, and Cowes. Not only must shapes, as a man would call them, change, but shades of colours too, and each season there must be some absolute novelty. Now, it is a difficult thing to find shades of colour that have not been in use before; but they must be found, and every spring bales of material are delivered to the fashionable houses in the West End all in the new tints that the scientists have evolved during the preceding months, which forthwith become the fashionable favourites. The discovery of these tints in the first place, and their commercial production in the second, is a very long and expensive business. For the most part, the persons who make this their business go to nature for their ideas, and the whole thing was explained to me in close detail some time ago by the head of one of the ladies firms with whom I happened to come into contact. The man who has the commission to find a new colour wanders in gardens and over fields and moors for the sole purpose of finding such. There are suggestions to him at every turn; but for one reason or another they are rejected time after time, until at length, after much weary wandering, his eye lights happily on the looked-for tint. Perhaps it was in a garden that he found it, and then he has very likely days of work in siting beside it while it is still growing, alive and in its fresh beauty, and imitating it as nearly as he can in artificial colours. All the pigments and chemicals of an artist's shop and a large laboratory are brought into service, and when the colour is really there on a piece of paper or cardboard it is borne off in triumph to Bond Street or Oxford Street, where it is duly approved, and it is decided that it shall be the fashionable colour of the next season. So it is these people wandering in gardens, and mixing their chemicals afterwards, who rule the colour-destinies of the London season, and not the grand ladies who have garments made of these colours, though the latter might scout the idea of the selection being due to any one save themselves. It was told to me on this occasion that a particular shade of red—and a really very nice red, too-which was then very much in vogue had taken eighteen months to fix and get into the shop. One of the colours of the present season comes from the imitation of the new Banksia rose which goes by the name of 'Dorothy Perkins,' and 'bee's wing,' 'mignonette green,' and 'sea-holly blue, are other tints that have lately been obtained from nature in just the manner described. They

will all be seen in London at the beginning of this season, and soon after they will be away to the provinces.

* * *

The extent which the agitation for the abolition of barmaids lately assumed must have given considerable alarm to that section of humanity which generally goes by the description of 'the gilded youth.' Remove the ladies from the other side of the counter, and to whom shall these gloriously attired and so smart young men give their little posies of flowers on Saturday evenings, to whom shall they pay such exquisite compliments? Who shall be benefited by their scintillating wit and the accounts of their own dare-devilry? Yes, abolish the barmaid, and some of these sparks of London will find an aching void to have come in their lives. But so far as the general body of Central Londoners is concerned, and even that sophisticated section that is comprised in the term 'men about town,' it is certain that there will be no tears shed on the departure of the lady from behind the bar. A considerable change has come over the taste of those free-living but more sensible Londoners who used to frequent bars. A large proportion, if not an absolute majority, of those who still do so prefer men to wait on them, and a change was made from female to male attendants at one of the most famous bars in London not many months ago, constituting something of an epoch in bar-history. And for the rest, many clever men who will drink their wine at nights among more or less casual company are showing an increasing disposition to give up the bar habit in these times, and to repair themselves instead to one or other of the small class clubs of which there has been a considerable increase in town of late years. Bohemians of considerable intellectual merit do still go to some of the more celebrated bars, but in nothing like the numbers that they used to do, and the change is certainly one for the better all round. There was a time when you might encounter all kinds of celebrated people in the old Criterion Bar in Piccadilly Circus, the type and character of which were changed a couple of years ago. As it used to be, it was probably the most famous bar in the world, and a most entertaining book could be written of the stories that were told in connection with it. One evening a real bishop strolled into the bar during an interval between the acts of a play at the adjacent theatre, and called for a glass of sherry. rollicking young bloods were spinning their best yarns to each other hard by, and for some reason or other, which was not obvious, the bishop, who had been standing in an isolated position, edged closely up to them, a circumstance which disturbed them exceedingly and interfered with their conversation. But they were equal to the emergency. In a manner as if continuing his remarks, one of the three said to the others, 'Well, as I was saying, one morning when it was too cold to pick any more

oakum'—— There was no need for more. His lordship swallowed his sherry at a gulp and fled.

* * As usual, those who are most immediately concerned are now beginning to prepare for the advent of the Americans, who in May come over to London in their thousands and tens of thousands. Their coming is now a distinct feature of the summer season in town, and what some of the hotels and the boarding-houses in Bloomsbury would do without them goodness only knows. It is as certain as anything can be that some of the big hotels would show no profit for the year if there were no American tourists to help them to do so. The wealthy Americans patronise the very huge hotels in the Strand and West End, and those of more moderate means simply fill up some of the streets round about the British Museum, until the Stars and Stripes might very fittingly be flown from some of the house-tops round about. This has always been a favourite quarter with them, and one of the reasons whimsically advanced for its being so is its convenience to the said British Museum, where it is certain several of them spend some considerable time during their visit in endeavouring to make pedigrees for themselves, a delightful occupation in which they are assisted by certain alleged specialists who profit greatly. Some fearful and wonderful results are sometimes achieved, and the man who walked out from Bedford Square at ten o'clock in the morning as plain Cyrus K. Jonker has been known to return to the dinner-table again at seven with a 'de' in his name, and to indicate to others assembled at the board the precise part which his ancestors took in some of the bloody battles of the Middle Ages. 'The American rush' is expected to be at least as big as ever this year, and it has been very big of late years. It was estimated last season that one hundred and fifty thousand Americans sailed from the different ports to England for the almost exclusive purpose of holiday-making. It was ascertained that during the four busy months the great fleet of ocean steamships sailing from New York carried approximately twenty-five thousand passengers a month, and large numbers left earlier in some cases and sailed from other ports in others. An authority who knows a great deal about these things reckoned it up some time ago that among them these tourists spent thirty million pounds in the course of their trips, or an average of about two hundred pounds each.

Talking about the British Museum reminds one that there is a sad time ahead for the industrious army of literary workers who toil day after day in the wonderful reading-room, for the trustees have decided to commemorate the fiftieth anniversary of the opening of the room, which occurs in a week or two from now, by an elaborate scheme of redecoration which involves closing it for a period

of some months. It is felt also that it is time that the magnificent dome, which is only two feet less in diameter than that of the Pantheon of Rome, should be thoroughly overhauled. It is wonderful to think that there are now nearly four million entries in the catalogue of the Library, all of the books so entered being at the disposal of the men and women who have permission to use the room, and who in many cases spend the whole of their working days in it from the beginning of the year to the end. Every year two hundred and seventy-six thousand copies of newspapers are added to the collection, and about fifty thousand books are received under the Copyright Act, ten thousand presented, and some thirty thousand, mainly foreign, are purchased. There are forty-three miles of shelves for the accommodation of all these books. The readingroom has comfortable accommodation for four hundred and fifty-eight persons at a time, and the average daily attendance is more than seven hundred. Temporary accommodation will be found for a few of the more regular readers while the decorations are being done, but many must be excluded, and their incomes are likely to suffer in consequence. It is the fashion of some people to sneer at the literary workers who spend their time here amid such resources as could be placed at their disposal nowhere else in the world, and to suggest that the results of their labours are for the most part mere compilations of little more than ephemeral interest. Possibly it was Washington Irving who set the fashion in this respect when he wrote the chapter on 'The Art of Bookmaking' which is included in The Sketch Book, and prefaced by a quotation from Burton's Anatomy of Melancholy: 'If that severe doom of Synesius be true, "It is a greater offence to steal dead men's labour than their clothes," what shall become of most writers?' This paper is entirely an exaggeration of an idea that Irving himself developed in the course of a brief visit to the place. He did not know-as those who imitate him do not know-that many of the works which will rank high in value among the four million that are on the shelves were written in that very room, and that some of the greatest writers of the day have gone humbly to it for its assistance like the others, and have worked there the whole day long. In days gone by I have seen both Lord Rosebery and Mr John Morley making biographies in this room, seated at the writing-desks with piles of books about them just like the rest. There are no class distinctions in this wonderful chamber. There are men there day by day who are making several thousands a year, and have their motor-cars waiting for them at the gate when they leave at closing-time; and there are others who have sat next to them all day who go home to a garret and a crust of bread, and think they have had a good week if some thirty shillings should come their hungry way.

HOPPY.

CHAPTER IV.

HERE was an unwonted stir in the barracks on the morning of Hoppy's court-martial. Early though the proceedings had been announced to commence, officers and civilians of all ranks and conditions were riding

up on their ponies—preceded by their panting saices (grooms), to whom they threw the reins on dismounting—a full hour beforehand.

Like all courts-martial in a civilised country, this one was open to the public; and, in view of the great interest taken in the case from one end of India to the other, the accommodation of the big hall wherein the trial was to take place was likely to be taxed to its uttermost.

On all sides groups of gold-laced, scarlet-and-blue warriors, in all the glory of cold-weather 'full dress' -for khaki knew no place on this important occasion-eagerly discussed the affair; and here and there knots of dark-green, almost black, uniforms denoted the presence of Sooties. Most striking of all, however, were the officers of Native Cavalry, who, instead of the nearly universal white helmets, wore as head-dresses strange-looking but handsome gold-streaked pugrees or turbans of divers colours wound in thick folds round conical red caps. Large flat epaulets, too, composed of hundreds of overlapping shining steel rings-a protection to the shoulders against sword-cuts—gave a quaint and old-world touch to their uniforms reminiscent of the days of armour, while white breeches and black boots with flaps reaching well over the knees completed the picturesqueness of their

As the time approached for the opening of the court its members made their way in ones and twos to the door, where a couple of sergeants mounted guard to see that none but those taking nat in the proceedings entered before the president had completed the preliminary formalities. These were soon over, and the officers having solemnly sworn to 'try the prisoner without partiality, favour, or affection,' &c., the doors were finally opened, and the waiting crowd admitted. Private soldiers there were none, the several commanding officers having wisely agreed among themselves to keep their respective bettalions busy in camp and barracks that morning.

With a marked seriousness of demeanour, and except for the rattle of swords and accoutrements, with an absence of noise or chatter which would have set an example to the courts at Temple Bar, the seats which rose tier upon tier for two-thirds of the long building filled rapidly with silent men. Down the centre of the open space at the extreme end of the hall was a long, baize-covered table littered with pens, ink, and paper, round which

were ranged in two many-hued lines the gravefaced members of the court. At the head sat the gray-haired president, his breast covered with glittering decorations won during many years of strenuous service in different parts of the Empire, and on either side were two little tables occupied by a couple of carefully chosen officers undertaking respectively the duties of 'prosecutor' and 'friend of the prisoner,' as counsel for the defence, when not a real man of law, is somewhat clumsily styled in the Army Acts.

At a court-martial everything is straightforward; common-sense decides every point, the trained elocution and passionate appeals of professional advocates being absent. Plain statements and no sentiment are the foundation of its procedure, and rarely does the decision arrived at by its members cause any miscarriage of justice. Soldiers themselves have every faith in the judgment of their officers, and, knowing that no legal subterfuges will avail, seldom plead 'Not guilty' unless really innocent.

It was to face such a tribunal, then, that—at a sign from the president, an orderly having opened a small door in the farther end of the building—Hoppy, amid a profound silence, and accompanied by an officer, walked quietly into the hall. He was in undress uniform and bareheaded, and his sword, instead of being honourably girt about his waist, was lying on the table in front of the president, a tell-tale token of its owner's unpleasant position.

Taking his place at the foot of the table—he needed no telling where a prisoner should stand, for many a man had he tried himself—Hoppy stood composed and erect. He looked—as was but natural after the long days of arrest spent in his room awaiting the decision from Simla—somewhat pale and thin; but his bright-blue eyes had lost none of their frank fearlessness of expression, and it was quite evident that he had the universal sympathy of the room, including the members of the court.

'Lieutenant Frederic Lechmere Eustace Apner, is that your rank and name?' solemnly asked the president.

'Yes, sir,' said Hoppy.

'You are charged, firstly, with having at Rhanibad, on or about the 3rd of September 188-, disobeyed the lawful command of a superior—namely, General Sir John Ranger, K.C.B., &c.—in that you opened the Eastern Gate, and left the town, after receiving the order, "Keep it shut and see that nobody passes in or out," or words to that

'Secondly, with conduct to the prejudice of good order and military discipline, in that, at the same time and place mentioned in the first charge, when in command of the gate-guard, you absented yourself from the said guard without leave from your superior officer.

'Do you plead guilty, or not guilty?'

'Guilty to the first charge, not guilty to the second, sir,' answered Hoppy.

A wave of motion rippled through the hall at this unexpected reply, and signs of astonishment could be read on every face; but the scratching of the president's quill-pen as he carefully noted the pleas, and a smothered sneeze from a member with a cold, alone broke the oppressive silence.

'Call the first witness,' presently said the president; and the prosecuting officer, jumping briskly to his feet, cried, 'General Sir John Ranger.'

Again the little door opened and admitted the principal witness, who, placing himself beside the president, was duly sworn, and gave the following evidence:

'On the 3rd of last September,' he said, 'I myself gave the order to the officer in charge of the Eastern Gate at Rhanibad to keep the gate closed and to allow nobody to pass in or out until further orders.'

'Was that the officer, Lieutenant Apner, now before the court?' asked the prosecutor.

'Yes.'

'Are you certain that he heard the order, sir?' asked the 'prisoner's friend.'

'Yes, for he replied, "Very well," or something of the same kind, answered the General.

'Did you mean him to understand that this order applied to him, considering his position, as well as to everybody else, Sir John?'

The witness hesitated for a moment—it was evident that the question was unexpected—then he abruptly replied, 'Yes, I did. He had no necessity to go outside the walls at all,' he added, as if wishing to justify his words.

'Thank you, Sir John. We will not trouble you any further,' said the president, glad to get rid of the great man. Then, addressing the members of the court, he asked, 'Does any one require any more evidence on the first charge, to which Lieutenant Apner has pleaded guilty?'

A murmur of 'No' came from those addressed, and then the witnesses to the second charge were summoned.

The first was the sergeant of the guard on the fatal day, who in a few words stated what everybody already knew: that Apner had left his command, and, going out into the plain, had brought in at great risk his wounded adjutant, Captain Vare. Then followed a couple of soldiers who swore to the same thing; and this being quite enough evidence for the prosecution, the president asked the 'prisoner's friend' if he had any witnesses to call on the latter's behalf.

The officer seemed at first rather at a loss for an answer, but eventually said, 'I must confess, sir, that Lieutenant Apner's plea of "Not guilty" to the second charge—which he only confided to me his intention of making a few moments prior to the opening of the

court—has placed me in a very awkward position. My friend, of course, does not deny that he left his guard; but he says that he did not do so without the authority of a superior officer. Naturally, I expected that he would give me the name of this person; but for some reasons best known to himself he totally declines to do so. Under these unfortunate circumstances, although I do not throw any doubt upon his assertion, I cannot help him in any way, and thus the only defence that I could make must necessarily fall to the ground. regards Lieutenant Apner's career, I can only urge that it has been an honourable one, and I feel that nothing I can say in mitigation of his fault can plead half so effectively for leniency as his heroic deed, with which all India-ay, and Englandrang at the time, and which, apart from the breach of discipline involved in its committal, must appeal to the best feelings of all brave men.'

As the officer resumed his seat there was a stir throughout the hall, a gentle clatter of swords and spurs, marking how profoundly touched were his audience by the 'friend's' well-chosen words; an impulsive Irish subaltern even so far forgetting himself as to audibly ejaculate, 'Roight, begorra!' and then hung his head in frightful confusion as stern looks of amazed disapproval were turned on him from all directions.

'If I hear any more remarks such as that I shall have the court cleared. This is not a theatre,' severely cried the president, who had seen this original remark, this pearl of price, reported as having dropped from the lips of Her Majesty's judges at least twice a week ever since he had been old enough to devour the law reports in his daily paper. He knew, therefore, what was the correct thing to say under the circumstances, and it certainly produced a great impression, though a close observer might have seen something very like a smile flicker across the faces of the younger and less red-tape-fed members of his audience, including that of the accused man himself.

But it was gone almost as quickly as it had come; and when the president, looking the latter sympathetically in the face, asked, 'Do I understand, Mr Apner, your friend to urge that you did actually obtain the sanction of a superior officer to your leaving your guard?' he answered seriously enough, 'Yes, sir, I did; but I cannot give the name of the officer.'

His interlocutor looked perplexed.

'Reflect a moment, pray,' he said impressively.
'Your whole career hangs upon your statement. I do not wish to say anything to increase the painful position in which you stand; but I fail to see the use of your assertion unless you are prepared to go further and give us the name I ask for. Indeed, those who do not know you may well imagine that this is but an unworthy attempt to clear yourself at the expense of allowing a stigma to rest upon some innocent man, who, if your words are true, would, I have no doubt, instantly come forward to sub-

stantiate them. Now, I ask you once more, will you give me the name?'

Hoppy hesitated—hesitated for so long, in obviously deep distress, that the scene became dramatic in its intensity. His eyes assumed a far-away look; for his thoughts had flown to his old father and Mirabelle. The temptation was strong upon him; the devil at his elbow, always ready to profit by these occasions, whispered, 'Tell them. Rex will corroborate. What does a pledge of silence given under such circumstances amount to? A man who will not himself come forward to save another placed as you are does not deserve mercy. You will be acquitted of the graver charge, and public opinion will prevail, so that the first one will be as nothing. You may even yet get a V.C., and your darling will be happy. Tell it! tell it!

But then, slogging through his brain, came his words to Morrison, 'Word of honour,' and with that he saw clearly. And, coming back to his surroundings, he alowly but quite decidedly said, 'No, sir. I have thought it all out. My career may be ruined; but I can't give you the name. Honour forbids it—the honour of the service and my own.'

As the full significance of his words struck this assemblage of men to whom the honour of their cloth was above all things, a great amazement held them, and then suddenly the silence was broken by a crash, and one of the officers among the spectators fell from his seat like a log. There was instant confusion; not so much on account of the fallen man, but because of the excuse thus offered to all to relieve their strained feelings by movement and speech. But it was soon over. 'It's Colonel Morrison, sir,' cried somebody in answer to the president's inquiries. 'He's in a fit, or else fainted.' And then, the stricken man having been carried out in charge of a doctor, the court was immediately cleared and the members left alone to consider their verdict with closed and guarded doors.

Their deliberations were of short duration, and concerned only the second charge and the plea of Not guilty. It was obvious to every member of the court that there was something deeper underlying the formal evidence that they had heard, something that their earnest desire to fathom would be baffled at the commencement by the accused man's refusal to give the name that would in all Probability clear him. They every one of them believed his assertion, for he was known to be as truthful as the daylight; but as long as he kept silent, and the mysterious 'superior officer' did not come forward of his own accord, they found themselves perfectly helpless in the matter. Their duty, therefore, on the only evidence before them, was clear enough; and so, very reluctantly, they one by one, beginning with the junior, replied in answer to the president's individually put question

of 'Guilty or Not guilty?' 'Guilty of both the charges,' and listened, with sorrowful hearts, and a feeling that there was something wrong somewhere, to the complaining, scratchy pen as it recorded the fatal verdict.

And now the court is again opened, and the body of the hall filled with the gorgeous uniforms. An air of suppressed excitement is visible on nearly every countenance; for the spectators feel that the crucial moment has arrived which will decide the disputed question as to which is the greater power -public opinion and great private influence, or the rigid rules of discipline. It was an open secret that the sympathies of the court inclined to the side of the former, which, through the medium of the press, strongly supported the view that the motive which had prompted the committal of the military crime—the saving of a wounded comrade-should have sufficed to condone the fault in the eyes of the supreme authorities. Would the court, each man asked himself, by announcing a verdict of 'Not guilty,' in spite of the formal evidence to the contrary, dare to flout their General and administer a rebuke to his severity? The junior amongst them, still filled with the optimistic spirit of youth, thought it would; but the older officers, too well aware of the power of the sacred red-tape, openly laughed at the bare idea of such a thing as they once more sought their seats. Then once again the little door at the end of the hall opened, and for the second time that day the accused man, with his face stern and set, took up his former position and calmly awaited his fate.

It was a dramatic moment. Would the president rise from his chair, and with a few kindly words return the prisoner—for such he in reality was—his sword, the sign of an acquittal? Or would he ask the prosecutor the few formal questions relative to Apner's length of service, &c., which would denote that the latter had been found guilty?

The suspense was not long. A couple of minutes had hardly sped ere the spectators found themselves turned out for good and all. The unfortunate Hoppy had disappeared—his sword, alas! remaining on the table—and the members of the court were left to their last and most unpleasant duty of deciding upon a fitting sentence.

Once more was the junior of them all—such is the rule—the first asked to state his ideas upon the subject; but the answers, which were very diverse, need not be recorded here. It will suffice to say that an agreement was eventually arrived at, written out, and added to the other documents, and then the whole bundle of them being solemnly sealed up, the court was broken up, and the fat blue envelope, with its secret, was carried away by the president to be despatched up the weary rungs of the ladder of routine, for final confirmation by the great man sitting at the top.

(To be continued.)

SANT' ANGELO: AN IMPERIAL FORTRESS.

By E. S. RORISON.

INCE the dawn of civilisation, history witnesses to the fact that man has ever sought to manifest his thoughts and activities in his architecture.

Bearing this in mind, we come in natural sequence to the effect of

character upon architecture, and vice versa. The mysterious wisdom and extreme culture of the Egyptian people can be gathered from the extent and magnitude of their buildings—the Pyramids and other gigantic remains still standing. The grace and harmony of the Greek mind is reflected in the exquisite beauty of form and proportion in Greek architecture, seen, as all the world knows, in the ruins of the Parthenon. From Greece we pass to Rome, and come directly to our subject, Castle Sant' Angelo in the Borgo, the most important of the fourteen districts of Rome, where St Peter's and the Vatican are also situated.

Thanks partly to the wonderful Italian climate, partly also to their skilled use of the arch, the architects of ancient Rome were often able to employ inferior material, and the greatest mausoleum in the world, erected in the second century of our era, was built of travertine stone, cased merely with Parian marble. The Emperor Hadrian, who raised his own marvellous memorial, was a passionate architect, and beauty and strength entered in equal proportions into his design. Later, in medieval times, outer walls and bastions were added to the square foundation of the mighty central fosse, the niches of whose outer galleries were embellished, like the parapet of the bridge which leads to it, with beautiful statuary.

Germany has the Wartburg, Moscow the Kremlin, Paris the Bastille, Scotland the castles of Edinburgh and Stirling, London its famous Tower; but Sant' Angelo of Rome transcends them all in the stateliness of age-worn tradition, the unfading glory of a historical past stretching back to the twilight of A.D. 130.

Centuries elapsed between the passing of Hadrian and the coming of Belisarius, the mighty Macedonian general under whose auspices the mausoleum was converted into a fortress, during the Gothic wars in the sixth century, to sustain a memorable siege, in the course of which the defenders hurled the very statues at the enemy below, to be found long, long afterwards in the ditch; amongst them the famous Berberini Faun now at Munich, and the Dancing Faun at Florence.

A few years later, at the time of pestilence, Pope Gregory, leading a procession of penitents over Hadrian's stately Ælian Bridge, looked upwards, and saw an angel sheathing a bloody sword on the

summit of the dome, as a sign that the prayer of the plague-stricken city was heard and the scourge stayed. From that day onward Hadrian's fortresstomb became known as the Castle Sant' Angelo, and the figure of an angel on its loftiest battlement gave point to the title. Henceforward Sant' Angelo played a prominent part in the affairs of Rome, and the history of the fortress and that of the city are

During the Middle Ages, Sant' Angelo in wartime proved the key of Rome; in peace its chief stronghold, rallying-point, and, as was the case with so many great historical fortresses, its prison. From the time of the seventh century the castle was the chief possession disputed for, and held alternately by popes and anti-popes. At the era of the worst papal decadence, the tenth century, it passed into the hands of Theodora, Senatrix of Rome, who assumed the government of the city. Her grandson Alberic played a successful part in the revolution of 932. Sant' Angelo at the dawn of the eleventh century was seized by the Emperor Otto III., to fall eventually into the hands of the nobles until regained by the popes.

As the centuries elapsed great names became inalienably associated with the fortress, which was either the rallying-point, prison, or death-place of the various Republican leaders: Alberic, Crescentio, Arnold of Brescia, Rienzi, Porcaro. Great Roman traditions were interwoven with the vast masonry of the castle. Its walls were silent witnesses to the deeds of heroism, crimes, and sorrows enacted and endured within their limits. memorable, perhaps, of the many different parts played by Sant' Angelo was that it bore during the siege of Rome by the Imperialists in the sixteenth century, rendered famous by the prowess of the swashbuckler goldsmith Benvenuto Cellini. Thus the great fortress has endured even to the present day immune, apparently, from the ravages of war and time and decay.

History dwells, on the whole, but lightly on the fate of the many personages who played their parts in the long roll of drama staged at Sant' Angelo. Like a vivid shifting panorama, the tale is spread before the inquirer. Scene succeeds scene with bewildering variety and rapidity. First, the magnificent obsequies of Hadrian, laid to rest in the very heart of the circular maze of chambers and galleries; later, the siege captained by Belisarius amid the fury of Gothic warfare, when missiles were hurtled from the walls. The picture fades, and tranquillity enfolds Sant' Angelo as the peace of sunset illumines the saintly old face of Pope Gregory the Great. When history next lifts the curtain the castle blazes with the torch-lit orgies of Theodora, the extraordinary Senatrix. At a later period the courtyard is again lit up with an unnatural flare, in daylight this time, the lurid flames of Arnold of Brescia's death-pyre.

Through the succeeding centuries the long passage leading from the Vatican echoed again and again to the hasty muffled footsteps of popes fleeing to the shelter of the castle. Again and again the summons to arms rang through the galleries within, and the impatient hoofs of war-horses struck sparks from the paving-stones of the outer courtyard. Toward the close of the Middle Ages the quivering figure of Stephen Porcaro hanging from the tower of Sant' Angelo witnessed to the reward of disinterested zeal in those days. The sixteenth century involved the fortress in the storm and dust of the Bourbon onslaught (1527). Within the walls scenes of equal violence at times took place. Here languished the beautiful Cenci, victim of one of the darkest tragedies known to man. Here, too, irony reached its limit in the fierce jest of Cardinal Carafa's stately execution in the best room of the castle, owing to his rank! It is a relief to turn to the plottings of the gay desperado Cellini, who decorated his bed with flowers every day, before escaping with his rope of torn sheets from the castle cell. For a time, also, the Roman fortress yielded its grim hospitality to Cagliostro, that master-adventurer of the eighteenth century; and it was the bell of Sant' Angelo that proclaimed the birth of the ill-fated Stuart, Charles Edward, on the last night of December 1720. Under 'the Corsican,' Sant' Angelo served for long as a French garrison; and to-day, in the first decade of the twentieth century, still exists a living fortress. To-day, too, it is not a little interesting to note that within the last few weeks negotiations have been concluded between Professor Rava, Minister of Public Instruction, and Senator Cruciani Alibrandi, Syndic of Rome, for the formation of a medieval museum within Castle Sant' Angelo. Many medieval treasures hitherto inaccessible to the public, stored in various buildings and private collections throughout Rome, will now be gathered together in the fittest surroundings antiquarian zeal could wish.

In a famous passage, Lord Macaulay the historian descants on the feelings of the New Zealander of the future who is to take his stand on a broken arch of London Bridge to sketch the ruins of St Paul's. It is to be regretted that no picture is extant from the pen of that wonderful word-painter doing justice to the subject of this article, which assuredly would have afforded his historic imagination splendid scope. New Zealander or no, as long as a certain section of human nature cares to linger round the evidences of the past, and as long as the outward symbols of these evidences survive, three great mausoleums there are which will attract increasingly successive generations of such pilgrims of humanity. Eastward, under the burning sky of India, near the river Jumna, rises that glorious witness to deathless love, erected by the Emperor Sháh Jehán, the Taj Mahal, the tomb of his favourite wife, Mumtázá Mahal, tenderly described by Eastern story as the fairest woman who ever lived. In the north of France, in the mausoleum of the greatest soldier of modern times, on the banks of the Seine, the ashes of Napoleon rest, at his own request,* in the midst of the people he loved; whilst westward, beyond the Tiber, memento of another Emperor, Castle Sant' Angelo still stands, proud guardian of the traditions of a great race, of the historic stream, and the Eternal City.

THE BRIDGE-WARDEN.

PART II

CROUCHED under the shadow of the parapet with my sword in hand, for I had not yet disused my soldier's custom to go always armed. The horses drew nearer and nearer

now and then a rough voice reached me against the wind. It seemed as if hours passed instead of minutes, and in a strange fantasy I made pictures out of the black clouds driving in the wind. At last they were upon me, and I leapt up and faced the big Earl

His great black horse, nervous as horses are, snorted and fell back on his haunches. I think the creature wrenched his back, for he did not rise; but the Earl freed himself swiftly, and stood raving and cursing at me, and, taking me for some belated vagabond, bade his men seize me and throw me over the bridge; and when I laughed he smote at me. He knew that I was no yokel when he met my

guard, and shouted quickly to his men to keep back lest they hampered his arm. I withdrew a step, and challenged him to come past his horse, which lay between us, if he dared. He came quickly enough, and then we fought.

I would that I had skill of words to tell the story of our sword-play, for I had some renown in the army as a swordsman, and never have I met so strong and skilled an adversary. We feinted and smote and parried and advanced and retired for a quarter of an hour, and sometimes when the moon was hidden for a moment we waited cautiously on guard, resting our arms. I had two flesh-wounds, and a deeper one in the shoulder, and I had touched him thrice, when at last my sword went home, and he fell without a groan, and as he touched the

^{*} Inscription on the tomb of Napoleon: 'Je désire que mes cendres restent au bord de la Seine au milieu de ce peuple que j'ai si tant aimé.'

ground his followers rode forward. Happily the body of his charger impeded them, for their horses shied at this and at me, and would not advance. So the men dismounted, but foolishly came on two abreast, hampering each other, as their dead lord had foreseen; and I smote down eight, one after the other, fighting across the dead man as he lay on his charger. I can see in my mind's eye his dark, pale face as it stared with glazed eyes and open mouth at the moon; and behind lay the others, and those who still came on had to step on them.

Two stout men were now to the front, smiting not, but pushing me back with their guard, and giving no opening to strike them. Once I was driven off the narrow bridge I knew full well that they would surround me. Therefore, when they paused for a moment I turned and ran, thinking to get to my house. They followed closely, and the bridge filled from the other end till it was full; and since I was faint with loss of blood-for I had received several more wounds-and could not run, I turned to face them as I reached the bank. As I turned I heard a great shrick of many in one, and saw the bridge sway and disappear, broken by age and the unwonted burden; and presently there was a great crash, and the water flew up in clouds. The spray fell on me where I stood. I heard a few shrieks, fewer and fewer, and saw a white face here and there in the stream, and an uplifted arm!

Some few of the Earl's followers had escaped on the bank by my side; but they had no heart to fight further, nor had I. They slunk away, and I staggered to my house, and stanched my wounds and bound them. Then I went to the stable for my horse; but one of the knaves had stolen him while I was within. So I set out on foot to my lady's castle, thinking that some might cross by the fords and take her by surprise. I was faint and dizzy, and the wounds broke out again, and I reeled before the wind that blew upon me. There is an ill dream that I dream yet of a wild moon riding fast in a wild sky, and a fierce wind racing over a bare land, and a wounded man stumbling on to a place that was always far.

I reached it at last, and leaned against the gateway and knocked; and when they opened it I fell senseless within. When I came to from my swoon my lady, with her hair hanging loose, as she had risen from her couch, and clad in a long wrapper, was bending over me and dressing my wounds; and not till they were all bound would she hearken to me; and then I told her how I had taken toll of the Earl.

She called her men to arms, and set guards upon the walls, and had some tree-trunks hoisted, as I advised her, to let fall upon the enemy where they must crowd to attack the gateways; but they came not. So in the morning I counselled her to flee without delay, since she would not submit to the King; and when she dallied with preparations, as women will, I took matters into my own hands and gave orders for the wagons to be loaded, and

sent a troop to the port to secure such ships as were there—they found two, beside my lady's own barge—and bade all march straightway; and they made no demur, but obeyed me.

My lady would have had me embark first, with her; but I refused flatly, telling her that in a retreat the captain's place was at the rear. Then she said she would stay to the end with me; but I vowed that she should go straightway aboard or I would carry her. For a countryman had brought news that the King's army had crossed the ford, and it was no time for courtesy.

Finding me resolved, she yielded with good grace; but before she went she took a little gold brooch from her neck and fastened it at mine.

'Since you have served for no wage,' she said very sweetly, 'and only my heart can repay. Have a care of yourself, and follow safely, or you will cause me great sorrow.'

But I filled the three ships full and saw them go, and bade the men who were left scatter along the shore and save themselves by flight. Then I went back to surrender to the army of the King. For I would not follow my lady to France to see her marry there, and to take service against my King; and I judged surrender better than flight, since the end was speedier. Nor did I care greatly what became of me.

The captain of the advance-guard, to whom I gave my sword, cursed me for a braggart until one of the men who had fought on the bridge bore witness to my story. Then he cursed me again for coming to him to put my neck in a halter.

'It is the best deed that ever a man hung for,' he declared; and he gave me meat and drink before he sent me, under guard, to the King's lieutenant, Lord Marvain.

His lordship examined me with no more harshness than his duty demanded, and ill concealed his pleasure that I had slain the Earl. I owed it to his favour, I make no doubt, that I was not sent before the King till the morrow, when his anger had cooled somewhat; and he gave me a veiled hint to plead that I had but held the bridge against those who would cross it for purpose of unlawful and unauthorised violence. His wife, I learnt afterwards, was a second cousin of my lady's, and I credit him with some voice in the strange events which followed.

He sent me to a tent, on parole to stay within; and I slept most of that day and night, being spent and sick of my wounds. The next morning they led me forth to a court which the King held in my lady's hall; and when I was seated—for I was not able to stand long—I discovered my lady seated beside me. Some of the King's ships had sailed round the coast and captured her. She was greatly angered that I had not followed her, and turned her back on me; and when I whispered would not answer.

An usher called for silence, and the King turned to us sternly.

'You, lady, we know,' he said, 'and your proud, rebellious spirit; but who, sir, are you?' He looked severely at me.

'John Rix, sire,' I answered, 'some years captain of a company, under Sir William Evesham, in your service; and lately, for service of my ancestors, unworthily warden of the Loar Bridge, which I guarded with my life against those who would pass it unlawfully to commit violence upon your Majesty's subjects.'

Lord Marvain nodded approval; but the King's gaze did not relax.

'Did you risk your life for my sake, John Rix?' be demanded, striking his hand upon the table in front of him, 'or for—my subjects'?'

'For this lady, sire,' I said steadily; 'but I chose to surrender to you rather than to seek service with your enemies in France.'

'Did she invite you to such service?' he asked quickly; but I did not answer, although his eyes pierced me. 'Well, I will not force you to accuse her, only yourself. You aided her flight?'

'Yes, sire.'

'Knowing that she fled from my will?'

'Yes, sire.'

'What is your excuse?'

'To you, sire, none.'

He pulled his beard and frowned.

'Did you know that Lord Lanby had no warrant of mine to pass the bridge when you fought him and slew him?'

'No, sire.'

'But you thought so?'

'I did not think about it, sire.'

He smiled grimly.

'I think it would have made little difference if you had, Master John. It is plain that you preferred this lady's service to mine. Yet in all else
I judge you to be a loyal servant, and a brave one.
I shall rest with yourself what punishment you suffer.' His look upon me was not unkindly;
but his face was stern again when he turned to
my lady. 'You, madam,' he said, 'have openly
defied my will; neither have you submitted your
error to my judgment; neither have you held

to me against my enemies. If you were a man your life were surely forfeited. As you are a woman, I will cure your wilfulness in another way. Since you demur to my choice of a husband, you shall choose one for yourself—from my scullions! Unless'—he leaned forward and shook his finger at her—'unless the sturdy knave beside you, whom you have seduced from his duty, will take pity and marry you.—Come! will you take her for punishment, Master John, or shall she put up with a kitchen-knave?'

I looked at my lady, but she kept turned from

'The lady is nobly born, sire,' I pleaded; 'and I am but a poor yeoman. Punish me more, I pray you, and her less. She is but young, and'——

'Dare not to parley with me,' the King thundered. 'Make your choice, and that without another word.'

There was but one choice that I could make; for though it irked me to be the instrument of her punishment, and I could but expect that she would hate me and revile me, yet it was surely less shame to her to marry me than a kitchenknave; and I answered speedily lest I should seem to put scorn on her.

'I will marry the lady, sire,' I said; 'and but for the wrong I do her my punishment would be great reward. For I think there is none to compare with her on earth.'

And then my lady did a thing at which I marvelled; for she rose and bowed to me very courteously.

'I thank you, sir,' she said calmly. 'You do me no wrong.'

I thought first that she spoke but to anger the King; and then I thought—knowing her noble nature—that she spoke to show courtesy to me, since she knew full well I would have died for her sake; but when we were alone she held at my jacket with both her hands, and smiled the sweetest of smiles in my eyes. And then I knew that her punishment, like mine, was light!

THE END.

THE STORY OF SCOTTISH PEARL-FISHING.

By IAN BUCHANAN.

EARLS have been known and their beauty appreciated since the very earliest times. They require no lapidary's art to enhance their beauties, but come perfect from the weak-har come perfect.

the workshop of nature, and so are prized by all lovers of gems. To the greater number of people the pearl is known as a product of the East and of tropical seas, and few seem to be aware of the interesting fact that the industry of pearl-fishing is one of the oldest in the United

Kingdom, and that it is still carried on with considerable success, giving to those engaged in it a yearly return of, on an average, three thousand pounds. Nor are the single specimens of little account, for some of them are sold for as high a price as thirty or forty pounds.

The story of British pearls begins with the very earliest records of the country. The knowledge that there were pearls in Britain was probably one of the factors which caused Cæsar to invade that country, for Suetonius the Roman historian relates

that when Cæsar was planning the invasion he carefully compared the British pearls with the Oriental; and this gives a curious glimpse into the Gallic trade with Britain. The Romans were evidently keen to obtain pearls; but it is scarcely likely that they could obtain many from Scotland, where the finest were to be found, since the most productive rivers lie pretty well outside the area which was effectively occupied by the legions. Julius Cæsar gave a breastplate studded with British pearls as an offering to Venus Genetrix; but the gems seem to have been poor in shape and colour, for the historian speaks of them as being small, brownish, and leaden-coloured. Most probably they were only small seed-pearls got from the edible mussel of the seashore, large numbers of which are spoken of as having been obtained from the beds on the shores of the Irish Sea. Pliny, too, from his account of British pearls, would seem only to have seen the small pearls which Tacitus spoke of as being subfusca et liventia.

After the English invaders had conquered southern Britain and divided it into kingdoms, the learned Bede lived at Jarrow and wrote his history. Pearls from the fresh-water mussel were not then uncommon, for he speaks of mussels in the rivers containing pearls, sometimes pinky or hyacinthine, but oftenest pure white. Boece, the learned historian of medieval Scotland, gives a very full account of the fishery. According to that historian, 'the Hors mussilis, early in the morning, when the lift is clear and temperat, open their mouths above the water and maist greedelie swallis the dew of heaven,' and from that they produce pearls. This same reason for the production of pearls is also given by Camden in his Britannia. The mussels, Boece continues, are so gleg of hearing that any sound on the bank causes them to disappear among the mud. He gives a description of how men go into the rivers to fish the shells, and how, as Bellenden puts it in his translation, they would 'cleek them up with their tayis.' The details are so exact that it seems certain that Boece must have watched men fishing, probably in the river Tay, on the banks of which he was born, if he did not himself take part in it and cleek shells up with his 'tayis.' 'The pearls,' he says, 'that are gotten in Scotland are nocht of little value, for they have a clear, shinand whiteness, round and licht, and sometimes are as muckel as the nail of a man's finger, of which we have had part.' So that he at least possessed some.

At a later date, in the seventeenth century, there was some attempt made by James the Sixth to regulate the fishery. In 1620 Sir Thomas Menzies of Cults, in Aberdeenshire, presented to the king a large pearl, which tradition says is now the top pearl of the Scottish crown. It was found in the river Ythan, which old historians call the rich rig of Scotland. The present seems to have stimulated the king to institute a search for pearls in his kingdom. Letters were sent to the various men in

power to prosecute the search, and proclamations were issued ordering the pearls to be sold only to these men. The reply of the Earl of Melrose to the order of the king is in existence in full, and is extremely interesting. The Earl, acting under orders from the Lord Chancellor, had appointed Sir Robert Gordon of Sutherland, the Lord of Kintail, for waters in Ross, and Mr Patrick Maitland of Auchencrieff for the waters of Eythen. These men were to buy all pearls, and no others were to deal in them. But the crop of pearls seemed to fail suddenly. Sir Robert got none, and my Lord of Kintail had not heard of any in Kintail. But an explanation seems to be given of the scarcity in a later sentence in the letter. Mr Patrick Maitland 'persewed some men in Aberdeen before the Counsell for their unlawful buying of pearls since the proclamation, who compeiring, some confessed a small quantity but of no value, the rest being sworn and examined denied.' We hear no more after this of royal dealings in pearls; and probably the Pearl of Kings, as the Earl calls him, forgot all about them when he came to his larger kingdom. But some men appear to have received patents for the fishery, for among the unprinted Acts of Charles the Second's Parliament of 1633 there is an Act repealing the patent for the pearl-fishery granted to Mr Buchan of Auchmacoy, in Aberdeenshire.

The fishery then grew to greater proportions in the next century, pearls to the value of ten thousand pounds being sent from the Tay district alone in one year. In the old Statistical Account of Scotland this period of great activity is spoken of, and it is noted that in many districts considerable numbers of people were employed in the fishery. In the notes from the Teith district, from Cargill, and from Dowally, however, it is noted that the beds gave out or that the demand for pearls grew less. In the note concerning the parish of Cargill it is reported that there was in the custody of the Honourable Mrs Drummond a necklace of Scottish pearls which had been in the possession of the ladies of that family for several generations. About a hundred years later than the great fishery mentioned above a new impetus was given to the industry, and it became very successful. Fishing was rigorously prosecuted under the direction of Mr Younger, an Edinburgh jeweller, and the harvest was very plentiful. In 1864 great numbers of people were engaged fishing in the rivers in the Trossachs, and an interesting account of the great activity shown is given in a journal of the time by an eye-witness. In a quiet Scottish way, it was a near approach to the rush seen on some new gold-Young and old, male and female, rushed into the water and waded and dived and swam till the excitement became so intense as to be called by many the pearl fever. Pearls were found, and that not infrequently, which were sold for considerable sums, and Mr Younger paid to those engaged in the Teith alone about six hundred pounds. Since that date there have been no rushes for pearls, but each year finds a number of men engaged in the fishery in the most productive rivers. The men employed in the salmon-fishing spend much of their leisure time in the search.

Many of the pearls are sold directly by the finders to wealthy people residing in the neighbourhood of the rivers, the shooting tenants of Highland estates being in most cases ready customers; but an increasing trade is now done in these gems by local jewellers. Single pearls from the Tay have recently been bought at prices varying from five to thirty pounds, and one is reported as having been sold for eighty pounds. The rivers most frequently fished are those of the Tay basin, such as the Earn, Garry, and the Tay itself, the tributaries of the Forth and the lakes which they drain, and the Ythan. The Isla, too, and the North and South Esks are productive. The Aberdeenshire Dee and Don have fishers resident on their banks, and the river Dochart in Inverness-shire is reported to have been fished well.

The methods adopted in this singular fishery are somewhat primitive. The fisherman wades in the shallows against the stream and inserts the point of a long stick which he carries in his hand between the gaping valves of the mussel, which at once close on it, and he easily lifts the mussel up. But naturally the shallows are soon fished, and a boat or raft of some kind is used for the deeper parts. Leaning over the edge of the boat, the fisher uses a watertelescope, which consists of a long tin can with a glass bottom, enabling him to see below the ripples clearly. The shell can be taken out with a pole or by an iron instrument like a double spoon, fixed to the end of the pole, which closes over each shell by its natural spring. After a sufficient number have been fished, they are taken ashore and carefully opened and the pearls, if present, removed. The expert fisherman professes to recognise a pearlbearing shell from others, and certainly he is often correct. The writer recently saw a shell taken from the river Earn, which is reputed to hold the finest pearls, that had held three pearls which sold for eight pounds. Three ridges were pointed out running from the hinge to the edge of the valves, and such ridges, it was stated, always showed the presence of pearls. In the growth of the shell room had to be left for the pearls. Even if the oldestlooking and most corroded shells are chosen, great numbers are often opened before any pearls are got; but, of course, as in all forms of treasure-seeking, a lucky find may be made at the very beginning. The fishery is carried on mainly from May to September, when the rivers are at their lowest and clearest.

There are two genera of fresh-water mussels to be found in Scottish rivers—the swan mussel and the pearl mussel (Anodonta cygnea and Unio margaritifer), and to the casual observer they are not unlike. But pearls are rarely found in the

former, and the pearl-fisher soon comes to distinguish them easily. The shell of Unio is about six inches long and two and a half broad, oval in shape, and convex above, and swollen and solidlooking, usually glossy and of a brown colour. The shell of Anodonta is usually greenish-yellow in colour, and much thinner-looking and fragile in comparison with the true pearl-mussel. The main difference, however, is in the hinge. In the Unio there is a strong tooth, forming with the margin of the shell a groove into which a corresponding notched tooth on the other valve fits; on the hind side of the hinge there is also a long plate-like tooth which locks into a deeply grooved plate on the left valve. The hinge of Anodonta, on the other hand, as the name shows, is quite plain and without any interlocking teeth. The Unio is to be found in the more swiftly running streams in the mountainous parts of Europe, and the umbones or prominences above the hinge are nearly always eroded by the action of the carbon dioxide gas dissolved in the waters of the streams in which the mussel lives. The interior of the shells of both is covered with a pearly coating, which is valueless. Unio is often more crescent-shaped than the swan mussel.

The presence of pearls was a puzzle to the older naturalists, as we have seen; and though presentday scientists have, of course, departed from the dew theory for a considerable time past, still no definite cause can be given for the presence of the gems. The evidence that they can be produced by inserting some foreign body into the mussel is very doubtful, though Linnæus the Swedish naturalist is said to have owed no small part of his fame to the fact that he could produce pearls by inserting grains of sand between the valves of the freshwater mussels which are to be found in Continental rivers. Artificial pearl crosses are reported from China as having been obtained by placing a thin metal cross within the body of the pearl-oyster, as the marine pearl-mussel is commonly called, and allowing it to stay there till it became covered with nacreous matter. Professor Herdman, in his researches on the pearl-mussel of Ceylon, has found that the pearls in these shells are secreted to cover a parasite, usually a nematoid worm, which passes one of its life-stages within the shell; and no doubt a similar cause will be found for the presence of pearls in fresh-water mussels. The commonly accepted theory that a single grain of sand within the mantle is sufficient to produce a pearl must no doubt be departed from.

Though the old industry of pearl-fishing is not lessened in any way, yet there does not seem to be much hope for its growth. The shells might be increased in number by cultivation; but when the prices of Scottish pearls are compared with the very high prices obtained for good Oriental gems, they are not sufficiently large to warrant any large expenditure in obtaining greater numbers.

SCIENCE AND ARTS. THE MONTH:

OUR INCREASING KNOWLEDGE OF MALARIA.

CCORDING to Professor Ross, who, as a foremost investigator of malarial fever, has lately been publishing accounts of his researches, the characteristic mark of the disease in an infected patient is the presence

in the blood and certain glands of minute black granules. These have been found to be the discarded refuse-matter of numerous parasitic organisms. Such 'protozoa,' as they are called (not to be confounded with genuine bacteria), have a peculiar Some breed once every twenty-four property. hours, others once every second or every third day. The discovery of this definite variety of habit was an important fact, for it pointed at once to an explanation of the well-known intermittency of malarial fever. And the next stage of research soon showed the underlying connection. It was found that the moment of germination or 'sporulation' was the occasion of the ejection of the black bodies. These latter are the direct cause of the disease, acting as they do as a specific blood-poison. But perhaps the most valuable step of all has been gained by proof that actual infection of a human being by the parasite is communicated by the mosquito. Thus, although as yet no infallible method of cure has been laid down, an undoubted advance has been made in the direction of the next best-namely, prevention.

THE BRILLIG LIGHT.

From the catalogue of the Brillig Light Company of Berwick-on-Tweed one gathers that the name is derived from that wonderful poem in Alice in Wonderland beginning, "Twas brillig and the slithy toves.' The exact appositeness of the adjective is not quite apparent in view of Humpty Dumpty's explanation that 'brillig' means 'four o'clock in the afternoon, the time that you begin broiling things for dinner.' The brillig lamp is one designed to consume petrol. In most of the many varieties the petrol is contained in a receptacle at a higher level than the burner, which it consequently reaches by gravity. At the burner the petrol is converted into gas and used to heat the usual form of mantle to incandescence. There are other forms of lamp, however, in which the gas is burned as a naked flame, and one of these latter, which is said to yield a light of twenty candle-power, has the petrol-container fitted in the base, whence the liquid is sucked by a wick packed into a metal tube, with a special form of gas-burner at the top. It is said that the cost of lighting by means of the brillig light is about one farthing an hour for a light of eighty candle-power. These lamps were successfully used throughout the winter at two stations on the North-Eastern Railway, and gave entire satisfaction,

although the stations are constantly swept by strong winds.

...x

WEIGHTS AND MEASURES.

There is so much opposition to the proposed compulsory introduction of the metric system into Great Britain that it is probable that the suggested law will be set aside again for a while. Much has been made by the objectors to the metric system of the fact that the metre is not an exact ten-millionth part of the quadrant of the meridian, as its inventors believed it to be. For practical purposes this scarcely affects the question; the English yard is an arbitrarily selected standard, but it is none the worse for that in practical use, and there does not seem much likelihood of the yard being lost and needing to be recovered. It is the definite relation between the unit and its subdivisions and multiples which really matters, and not its relation to the diameter of the earth or any other recoverable standard. It is not denied that the metric system might possibly be improved upon in this and in other directions; but it is perhaps more important to this country that it should at once adopt the system which is already in practical use by most other civilised nations than that it should retain its splendid isolation by the adoption of a perfect system of measurement which is different from that employed by other countries. Major MacMahon has indicated in a recent lecture the source from which a new standard of length may perhaps be forthcoming. The proposal is to take the length of the light-wave of some standard light produced under certain defined conditions (reproducible at any time), and make this the standard of length from which all other units could be deduced. In some experiments already conducted, the vapour of metallic cadmium was produced in vacuo, and rendered incandescent by an electric spark. It is possible to measure to a nicety the wave-length of any particular portion of the spectrum from such a light-source, and it is proposed to adopt this wave-length as the standard of length. The period of vibration of the same wave would form the standard of time, and the mass of a molecule of some definite substance the unit of weight. DRAUGHTS.

Adverting to a recent paragraph in this column on ventilation without draughts, a correspondent suggests that the draught-screen we therein noticed is analogous to the opening of a window-sash with a wide bottom bead, and he is doubtful whether the air renewal would be effected so imperceptibly as was suggested. He then goes on to say: 'The supply of air to the fire should be distinct from that to the room, and should be drawn from a source as near the fireplace as possible. There is a very simple plan that every one can adopt without expense worth mentioning. Make a few holes -of, say, one inch diameter-through the floor, on each side of the chimney-breast, and lead the air from these by means of an inverted trough round to the front of the cheeks of the mantelpiece. The troughs may be covered with carpet or otherwise dealt with to match the floor, and the end nearest the fireplace may be covered with perforated zinc to prevent any entrance of mice, &c., the other end being closed.' In his assumption that the air for the fireplace should be supplied independently from that in the sitting-room we are not disposed to agree with our correspondent. The fire is undoubtedly a powerful pump sucking away the vitiated air from the room, and as such it is valuable, and should be encouraged. That it will produce draughts if no provision is made for the proper entrance of fresh air to replace that drawn away is undeniable. But such provision should be made in every sitting-room, either by some such makeshift contrivance as the partially opened window-sash with the broad bead at the bottom, or the draught-screen already alluded to; or, better still, by a properly arranged system of ventilation provided for in the structure of the building.

COMFORT FOR PIANISTS.

That demon of every pianist, the necessity for constant soul-destroying practice at the keyboard, is threatened with exorcism by an inventor who claims to have discovered a means whereby the muscles of the fingers and arm may be brought into a fit condition without it. Mr Macdonald Smith is, by his own description of himself, a scientist and a musician at once, and by virtue of this rare combination of qualities he claims to have made a discovery which has hitherto escaped attention. He states that continual practice at the keyboard, in most cases, is not only ineffectual in bringing the muscles into the best possible condition for playing difficult passages, but is even detrimental to the player. There are a few individuals so highly gifted by nature that they attain the most marvellous execution after constant practice; but ordinary human beings cannot hope to reach that perfection even if they practised to their utmost capacity. Yet, according to Mr Macdonald Smith, they may attain wonderful execution without practising at all, except so far as is necessary to gain familiarity with the different keys. In a little booklet, Light on Pianoforte Playing, issued by Mr Macdonald Smith at his address, 19 Bloomsbury Square, London, the many advantages of his method of giving suppleness to the fingers of his Pupils are clearly set forth, together with a number of convincing testimonials from those who have benefited. The book does not, however, give much description of the method itself, although some idea of the process may be gained. In a very apt illustration the author describes how the mopping up of a pool of ink with a sponge would take some hundreds of applications if the sponge were only half-squeezed every time, whereas if it were squeezed quite dry three or four would be sufficient. He likens the effect upon the muscles of the fingers and arm by ordinary piano practice to the half-squeezing of the sponge, and in his method of muscular training he aims at squeezing the muscles quite dry every time. He gives lessons either personally or by correspondence in his method of training and in the technical rules which he has laid down in connection therewith. The actual exercise involves a maximum of eight minutes' manipulation, away from the piano, every morning and evening; and if the results attained are only half as great as they are claimed to be, the author of the book has indeed conferred a great blessing upon a large section of the community.

ENGLISH BULBS.

The vast industry hitherto associated almost exclusively with Holland is gaining a very promising foothold in this country, according to an article in a recent number of the World's Work. It is said that the climate of Holland is just like that of England, only worse; hence it is only natural that the flowers which grow so well in the former country should also flourish here. In the Fen district of Lincolnshire there are many acres of land devoted to the growing of narcissi; and so successful has the industry become that several prominent Dutch growers have even paid England the compliment of buying their stock-bulbs in this country, while others are said to have seriously considered the advisability of purchasing land in Lincolnshire for the growing of bulbs, so as to compete with the Englishman in his own land. According to Mr F. W. Burbridge, M.A., in his address at the Narcissus Conference held in 1906, 'an acre of wheat or potatoes may be put down as worth from twenty to fifty pounds, according to locality, variety, &c.; but an acre of choice daffodils or narcissi may be worth anything from fifty to five hundred pounds, or even more.' Here, then, may perhaps be found an antidote for the agricultural depression in England, and even in Ireland, where the conditions are also said to be thoroughly suitable to the growing of bulbs and of flowers for the market. See the article 'A Visit to a Bulb-Farm in Ireland' in Chambers's for 1901.

THE EARTH AS A STEAM-BOILER.

It will be remembered that in the driving of the Simplon Tunnel intense heat was encountered in the very heart of the Alps, heat which but for modern methods of cooling, aided by the water from an ice-cold subterranean river which curiously enough had been previously encountered, would have incapacitated the workmen and rendered further progress impossible. At the bottom of all deep mines the earth is very considerably warmer than at the surface. A theoretical increase of temperature of one degree for every sixty feet of depth has been based upon the results obtained in a variety of localities. This must, however, be

taken as only approximate, for great variation exists in different parts of the globe. There can be no doubt whatever that the heat of the earth gradually increases with the depth, and upon this is based a theory for a new and general source of power. It is proposed to bore two holes directly into the earth's surface twelve thousand feet deep and fifty feet apart, and at this depth there should, theoretically, be a temperature of about two hundred and forty degrees, far above the boiling-point of water. Then it is suggested that very heavy charges of dynamite should be dropped to the bottom of each hole and exploded simultaneously, with the view of forming a connection underground between the two wells. This connection having been established, the idea is to pour cold water down one hole, and utilise the steam issuing from the other for the various industrial purposes to which steam is applicable. It will be seen, of course, that the scheme has this much in its favour, that, apart from the original velocity of the steam itself, there would be the extra pressure -some five thousand pounds to the square inchof the descending column of water. According to the American Inventor, the scheme as an undertaking would not be beyond our present standards of cost and enterprise. It is believed that in the Pittsburg district the plan might be carried out for about ten thousand pounds, and that after that was expended there would be practically an unlimited supply of high-pressure steam for the mere cost of the water from which it was produced.

ELECTRIC TRAINS ON STEAM RAILROADS.

The recent terrible accident on an electrified railroad in America points to a possible danger in the conversion of steam tracks to electrical uses. The steam locomotive, from its nature, has a centre of gravity at a considerable height above the rails, and in taking a curve at high speed there is a certain amount of give in the hammering pressure of the weight upon the outer rail. In the case of the electric locomotive the weight is hung very low indeed, for the motors are in line with the axes of the wheels, and the whole weight is concentrated low down and upon a short wheel-base. The effect when such a locomotive takes a curve at a higher speed than that for which the line has been superelevated is a tendency to squeeze the outer rail out of its position. In the accident on the recently converted New York Central Railroad, the short, powerful, and very heavy locomotive exerted so direct a pressure upon the outer rail that the metal actually sheared off the heads of the heavy spikes by which it was attached to the sleepers. It does not appear that the locomotive was so heavy as many of the steam-engines which had been running safely over the track for many years, but the weight was concentrated on so short a wheel-base that the hammering thrust was felt on a comparatively short portion of the track at a time, and the heads of the eighteen spikes were neatly sheared off in succession. It would seem that the super-elevation rules should be carefully revised in view of the changing conditions of traffic on the American railroads, changing conditions which will certainly obtain before long in this country also. The suggestion is made in American scientific papers that the curves should be super-elevated for the maximum speeds for the trains which are to pass over them, and not for the average speed, as is the present practice. The average speed was selected because in many cases slow trains have to pass over the same curves; but when accidents occur through the train jumping the track, it is always the outer rail which is jumped.

A DRY EXTRACT OF COFFEE.

Liquid extracts of coffee are common enough; not so the dry extract, resembling cocoa in appearance -the invention of Mr Frederick John Reichert, a London technical chemist—which is being brought out for the first time. Mr Reichert has been experimenting for eight years in perfecting a dry extract from the coffee-berry, without the aid or addition of any chemicals, which should not deteriorate by long keeping. It may not be generally known that when coffee is prepared in the usual way a considerable quantity of the infusion cannot be exhausted from the grounds, and is therefore wasted; but in the process of making this dry extract such waste is avoided. The woody fibre and fat have also been eliminated without impairing the flavour, with the result that there are no grounds, and one pound of raw coffee concentrated occupies about two and a half cubic inches and weighs little over three ounces. It is claimed that one pound of raw coffee converted into extract will produce from four to six breakfast-cupfuls more than when one pound of coffee is roasted, ground, and brewed in the usual way. It can be prepared for drinking in exactly the same way as cocoa, while the delicate aroma of the coffee has been preserved. If this extract can be sold cheaply enough it ought to prove a boon to motorists, cyclists, and travellers, as well as be much appreciated for general domestic use.

BLUE EYES.

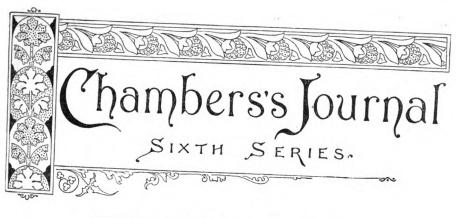

'Twas blue: not the blue of forget me-nots That hide among the fern; Nor was it the blue of lobelias On the banks of the babbling burn.

'Twas not the blue of the wide summer sky,
Though full of a heavenly glow;
Nor was it like the sky that swims
In the mirroring lake below.

'Twas stranger still: more like that night
Of the South—clear, radiant, deep—
That watched o'er Venice's whispering smiles
And golden Delhi's sleep;

The blue of Avelyon's fading shores,
Which veiled King Arthur's boat;
The distant blue of the fairy-haze
Where all man's wishes float.

GREGORY GREY.

ТНЕ. RIVER PASS.

By W. VICTOR COOK.

AUTHOR'S NOTE.

One of the most heroic of the many fine incidents in the early history of Canada was the stand made by Daulac (or Dollard) des Ormeaux and fifteen other young Frenchmen against the Iroquois army at the rapids of the Long Sault, on the Ottawa, in 1660. The French had made the cardinal blunder of allying themselves with the weak Huron nation instead of with the powerful and warlike Iroquois, who were, moreover, the sworn foes of the Hurons. The Iroquois organised a great confederacy of Indian nations against the French with such effect that the whites were in imminent danger of being swept out of the country. In the belief that the Iroquois had grown contemptuous of French courage, and that, if the country was to be saved for the white settlers, a supreme example was necessary to impress the natives, and prevent them from marching on Montreal, Daulac and his comrades voluntered to go out against the enemy, who were in strong force on the Ottawa. The offer was accepted, and after receiving the rites of the Church, the little band, at first accompanied by a few Hurons, set out for the Ottawa. At the head of the Long Sault Rapids they strengthened an old fort, and waited till the Iroquois came down the river. They were attacked, but held out for several days against the whole force of the Indians, who eventually sent for reinforcements. They were again attacked, and after a brave resistance were wiped out to the last man. It is said that four Hurons refused to leave them, and stayed and shared their fate. The news of the exploit was received in Montreal through the medium of a Huron. Statues of the Sixteen are placed along the façade of the Legislative Buildings at Quebec, and their names are preserved in the Seminary of St Sulpice at Montreal.

CHAPTER I.

the square before the church of Notre Dame at Montreal that is called the Place d'Armes to-day, a silent crowd of men and women waited in the May sunshine. A row of priests in black cassocks stood at

the entrance, and from the tower above a bell clanged in a vibrant monotone. Through their midst the crowd voluntarily left open a passage-way from the Rue Notre Dame to the church doors, and their expectant looks were directed down this to the long street of wooden houses. Here and there the

front of a house was draped in blue and white; here and there the lily banner of Old France hung from a window; but the crowd was strangely solemn. This was no festival procession that they were awaiting, with faces grave and anxious.

Hard by the step in front of the church door a tall and swarthy man in the moccasins and buckskin of a trapper stood watching with the rest. Like many of the men, he stood bareheaded, and the sun shone on the long jet-black hair that fell to his shoulders. His face was spare, with a hardy look of the forest life, and a fire lurked in the dark eyes that roved freely over the crowd. Gaunt and thin of figure, he might have arrested attention anywhere by the impression he conveyed of endurance and of independence. A short axe and a dagger hung in his belt.

'A long wait, mademoiselle,' said the man in a low voice to his next neighbour in the crowd, a citizen's daughter who stood with her father and

'Oui, monsieur. God give them safety, those brave men!'

The citizen murmured a word in his girl's ear, and she started and drew away slightly from the trapper. He gave a little bitter laugh, and nodded as if comprehending.

'Cest ça! Do not be frightened, little bird. There is no infection about a poor excommuniqué. Learn, pretty one, never to believe more than half of what they say about that wicked devil Jules Desbarres. One half-that is fair, hein! both to Jules and to Holy Mother Church?' He turned a look of angry contempt towards the row of waiting priests, and at the sound of his deep voice several of those nearest to him glanced up and drew back, so that the trapper was left, in a measure, alone.

'Merci, messieurs,' he said, with a contemptuous inclination. 'An excommunique has always elbow-

The bell clanged on. The tension in the waiting crowd became more acute. At last in the distance came the sound of chanting. Men's voices drew [All Rights Reserved.] MAY 4, 1907.

near, singing the Penitential Psalms. Here and there a woman in the crowd caught her breath in a sob and hid her face in her hands.

At length a little procession appeared, a procession of sixteen armed men walking slowly in Indian file, headed by a priest who bore the fleur-de-lys. Each man carried an arquebuse and wore a sword at his side. All were in the prime of youth. They chanted as they walked, looking neither to the right hand nor the left, and a sound of mingled weeping and benediction arose among the onlookers.

Jules Desbarres, the trapper, neither wept nor blessed, but he drew himself to his full height, and looked on the Sixteen with his stern face aglow with pride. He folded his arms tight across his chest, and as he watched the procession disappear into the church his nostrils dilated and his dark eyes flashed.

The clanging bell ceased its note and the crowd passed into the church after the young men, but Desbarres stood still in his place. In his imagination he could see it all, more vividly even than many of them that stood within: the consecration and the blessing, and the rank of armed men kneeling before the altar. He turned away, and with long, swinging strides descended to the banks of the wide St Lawrence.

As he passed the fortifications by the river a sentry held him a moment in talk.

'How goes it in the forest, Jules?'

'Burning and slaying,' said the trapper. 'From here to the Gulf the warriors of the Five Nations hold the land in terror.'

'Ay, that we know. Terror is king along the river, and no day passes but a fugitive from the eastward reaches us with some fresh tale of torture and death. But the army of the heathen on the Upper Ottawa—what is the news of them? Is it true, what men say, that they are three thousand strong?'

'It is less than the truth, my friend.'

'Mon Dieu! But are you certain, Monsieur Jules?'

'Death itself is not more certain,' replied the trapper. He tapped the sentry on the shoulder, seeming to take a grim satisfaction in the man's scared looks as he proceeded. 'I who speak to you have passed through the winter quarters of the Iroquois—and from Montreal Island here to the ocean there is no other man who could have done that and come out alive—and I tell you that when the new moon is full, five thousand braves will break camp and set out on the war-trail for Montreal. And may God have mercy on your souls!'

'Amen!' muttered the sentry, pale, and crossing himself. 'Five thousand! But the Governor's scouts said three thousand. Then this adventure of Monsieur des Ormeaux and his brave companions'—

'There is not a man of them who will survive,' said the trapper solemnly; 'and there is not a man of them but knows it, for I have told them. I

have spoken with Monsieur de Maisonneuve, the Governor, and told him the truth, and yet that brave man, Monsieur Daulac, and his comrades will lay down their lives for France. What did he say. think you, that captain of courage? "Monsieur Desbarres," says he, "we do not doubt you speak the truth. The pagans are glutted with success, and our men are everywhere dispirited with defeat and fear. The savages have sworn to sweep us Frenchmen into the sea, and if they carry Montreal all will be lost. It is necessary to take the offensive, and show a brave face, to cover the weakness of our garrison. It needs that a few shall stand for France -stand and not ask for aid-stand, if it must be, till the last man's dagger break in his hand. It is the only way to turn them from their design."

'But there are the Hurons,' objected the sentry. 'The Huron nation are our allies.'

'The Hurons!' Jules Desbarres spat on the ground. 'The Hurons are women. Who knows better than I? When we made that cursed alliance we brewed the mortal dish we eat of now. Adieu, monsieur! Keep your sword sharpened, and pray hard to the bon Dieu for His city of Montreal.'

The trapper strode down to the shore of the great, swift-flowing river. Close to the water's edge a birch-bark canoe lay drawn up on the strand, and beside it stood waiting an Indian girl, who smiled as he came up. She was graceful and soft-eyed as a deer—a very flower of her people. Without a word spoken, they launched the frail shell, and while the girl nestled in the bottom of the craft, Desbarres, with strong strokes of the paddle, sent it darting down-stream.

For some time they moved in silence save for the bubbling of the water beneath them. At sight of the girl's smiling eyes watching him the trapper's face lost a little of its sternness.

'You are happy, Woonona,' said he, in the soft Indian tongue that he had so well learned from her

'Your brothers the pale-faces would not have you to fight for them?' she said, not concealing her joy.

The Frenchman's mouth hardened in a moment, and he laughed his little bitter laugh. 'No, they would not have me. I told them many things it behoved them greatly to know. I would have cast in my lot with them, to stand and die with them, for, by the Mass, they are men to die with! But their priests long ago made me an outcast, pretty one, and this expedition is a very holy business. The priests make great medicine to-day before the Manitou, praying for the souls of the warriors.'

'I do not understand the ways of the pale-faces,' said Woonona; 'but I am glad they will not have you to fight for them—you who have the bold heart and the cunning brain of the white man and the red. The Iroquois will kill them all, but you will live.'

She gazed at him with eyes of love; but the

Frenchman, laying his paddle across his knees, knitted his brows and stared at the sunlit water dancing past.

'You will live with Woonona,' said the gentle voice.

'But I say they shall have me!' cried the trapper suddenly, and swore an oath in his own tongue.

The Indian girl started, and a wistful, half-frightened expression came on her face as she looked up at her lover's clouded brow.

Jules Desbarres gazed earnestly on her.

'Woonona,' said he—'O Woonona! Light-of-Morn! this is no small matter. My folks, have cast me out from among them; nevertheless, their blood runs in my veins, and when I see them harried like a herd before the hunters my heart cries out. Light-of-Morn, a little while since I spoke ill of your people. I said, "The Hurons are cowards and women."

'Yet we Hurons are friends with the French. And the chief, my father, and my brothers, are they women?'

'The chief, your father, and your brothers, do they not sit in their doors with buried hatchets while their friends are rooted out of the land, while the Iroquois nation, who have been their enemies since the world began, grow fat with spoil and drunken with our blood? Let the chief, your father, call his braves together; let but a few score take the war-path with me, and the name of the Huron nation, O Woonona! shall shine among brave warriors till the end of the world.'

The outcast's sombre face glowed with the emotion that his speech called up. He leaned towards the girl, and his words burned upon his lips.

Light-of-Morn, we pale-faces cannot die. A few of us, it may be, perish here and there. But if we fall, for every hair upon our heads there will come a hundred stronger than we in the great canoes from over the black water. Then they that have been our friends shall come to great honour, and with us rule all this land; but they that have fought against us when we were few and weak shall be utterly destroyed till their very name is lost. Light-of-Morn, I go to fight for my people against their enemies.

There was that in her lover's face and voice that held the Indian girl wondering. At length she put her hands on his knees as he sat with the paddle laid athwart.

'In any case,' she said in her low, musical speech, 'my white brother will not go alone. I will speak with my father, who loves you because of me; but even if he will not hear me, there is one of the Huron nation who will follow thee to the end. Weonona will not leave thee while the spirit is in her.'

The trapper gently took her alim brown wrists. 'Nay,' he said, smiling down on her—'nay, my forest floweret, that cannot be. We will speak to the chief together, and, if it may be, persuade

him to play the man. But the war-trail is too rough a place for thee, my pretty one. Nevertheless, Light-of-Morn, this I swear to thee because of thy brave heart: that whether thy people will take the path or no, there shall not be wanting a Huron warrior to stand beside the French in the great fight they go out to make, so that if they fall it shall be said, "A Huron stood with them to the last;" and when my people come from over the black water to take vengeance, the name of the Hurons shall sound sweetly in their ears, and that nation shall be spared for thy dear sake. And this I swear by the Holy Cross, and in my own tongue, que Dien me soit en aide!"

CHAPTER II.

ALTE-LA! Qui vive?

The sharp challenge of the sentry broke the light slumbers of his comrades round the camp-fire.

The leader sprang up, hand on sword, and strode to the side giving on the river, where the sentinel, with arquebuse ready, held cautious speech with one that stood below.

'A Huron brave, mon capitains, who demands to speak with you.'

Daulac des Ormeaux looked, and saw a warrior in full war-paint, but unarmed, who carried a small white flag. The full May moon, shimmering on the broad river behind, showed the dark silhouettes of a flotilla of perhaps a dozen canoes.

'Your business?' asked Daulac of the silent, waiting figure.

'We would follow the white men on the war-trail.'

The answer was in the broken French of the Indians who had traffic with the whites.

'We want no followers,' said Daulac. 'Why do you come?'

The Indian took a step nearer, but halted at the captain's warning cry. He was gaunt and tall, proudly sedate, with keen dark eyes that looked out fearlessly beneath the circlet of plumes that bound his brow.

'Chief,' said he, 'the moon shines bright. It is no time for deceit. Yet know that a half-hour ago I lay beside you by the fire. You are a little company, and here are a hundred of the boldest Huron braves. You heard no stroke of paddle when we came. If my warriors had sought your scalps you had all been dead men ere now. You go to fight the Iroquois, who are our foes and yours. Let us, then, go together.'

The white leader hesitated. He was suspicious, familiar with Indian guile.

'François,' he said to the sentinel, 'what is this that he says? He cannot have entered the camp?'

'Half-an-hour since,' continued the Indian imperturbably, 'ten of your company lay about the fire. While I lay among you, one rose and threw wood on the embers. Yet he saw me not. Thou, chief, hadst on the sleeve of thy sword-arm a token of blue ribbon, fastened with a brooch of silver. Here are the brooch and the ribbon.' He held them up.

Daulac des Ormeaux recoiled in amazement, feeling his sleeve with his left hand.

'Holy Mother! the heathen speaks truth.'

'The same hand that took the token could as easily have struck a dagger in thy heart,' said the Huron gravely.

'Let him draw near, François,' the French leader ordered. 'Ciel! To think we could be so easily outwitted! Come with me, friend.'

The Indian strode after him to the camp-fire, and, seating himself, proffered a pipe of tobacco, which was handed round the group.

'Why would you fight for us?' asked Daulac.

'Revenge is sweet to all,' said the Huron sententiously. 'See!' He held out his muscular brown hands, on which the flesh was twisted and scarred. He bared his chest, and showed the old sears of burning.

'We Hurons are a weak nation,' he continued.
'Alone, we cannot stand against the Iroquois. But it was told us: the white men take the war-trail.
And although not all our warriors would come, here are a hundred of the best.'

Daulac looked keenly at the impassive face of the Indian.

'By whom was this news brought to the Hurons?' he demanded.

'There is a certain hunter whom in our speech we call Gray Wolf,' said the other, with a momentary hesitation that escaped the watchful Frenchman. 'He is of your people, but he knows the forest like ourselves. He knows the speech alike of the white man and the red, of Huron and Iroquois, Mohawk and Algonquin. It was he who brought the news.'

'But,' said Des Ormeaux, 'this is no ordinary warfare that we go to wage. It is a fight to the end.'

'Where danger dwells, there is the warrior's home. Is it agreed that we come with you?'

'I will speak with my comrades. Wait,' said the French leader. He turned aside and conferred with his little band, while the Indian, stolid and motionless, stood in the moonlight before the campfire. Presently Daulac returned.

'Understand,' he said, 'we go to our death, one and all.'

'I understand. Yet death avoids the brave. Is it agreed?'

'It is agreed.'

Next day they went on together, the sixteen white men and the Huron band, paddling their canoes side by side up the great highway of the Ottawa, between the low hills of the distant banks and the dark pine-forests that whispered to the water's edge. The next day it was the same, and

the next after that. At last they came to a place where the increasing strength of the current compelled them to land and make a portage under the pines along the bank.

Here the Huron leader came to Daulac. 'Chief,' said he, 'that same Gray Wolf who gave us tidings of this journey told us also of a place that lies at the head of this rapid, and said that in that place ten men might make good their ground against a hundred.'

It was a long portage, and difficult. On their one hand the great river raced down between its narrowed banks in curling green eddies flecked with angry white splashes of foam. The noise of the rapids filled the air as the armed men toiled along, bearing their fragile craft on their shoulders, now making their tortuous way through a maze of dark pine-trunks, now scrambling on rocks or knee-deep in the bright-green grass of the Canadian spring. At the end of many hours of this kind of travel they emerged upon a wide, clear space by the waterside. They had passed the rapid, and the river here ran deep and smooth. Close to the bank an old fort stood half-dismantled. On the landward side of it, at a little distance, the pines brooded in a shadowed silence or whispered among themselves their own dark secrets when the breeze stirred their upper boughs.

'This is the place—a good place,' said the Huron.
'Here all men, before they run the rapids, put ashore and make spells to appease the spirits of the river. This is the place of which Gray Wolf spoke.'

Indeed, to a soldier's eye the place was unmatched for defence on all the river. The fort stood on a rising ground of rock, and there was no cover within a bowshot. On the east the river ran within ten yards of the stockades.

'We will await the heathen here,' said Daulac des Ormeaux. 'Comrades, let us make good the fort.'

So the little company laboured to bring up their scanty stores and repair the defences. In the midst of the fort they raised the lily flag of France. For a whole week they waited thus by the river, chafing at the delay.

On the last day of the week the Huron leader crouched alone in a thicket by the water's edge, ten miles above the camp as the crow flies, but many miles by the windings of the stream. Before his eyes there glided past a great fleet of canoes filled with many hundreds of warriors. He waited till the last had gone by, then rose to his feet, and at a swift run made his way towards the fort. Suddenly arose in his path the slight figure of an Indian girl. A cry came from her: 'Jules!'

He stopped in amaze, staring on her, and even under its stain his cheek blanched.

'Woonona!' he faltered. 'Art thou indeed Woonona?' Then he perceived how thin and worn she was, and he clasped her to him. 'How camest thou here, pretty one?' he said in gentle reproach.

'Where my white brother goes, I go,' she answered simply. 'I have followed. The way was long, and I was frightened; but the canoes were easy to see upon the river. I am very tired; but, since I have found thee, what of that?'

The seeming Indian smote his breast in an agony. But I cannot stay with thee, pretty one. See! the Iroquois come down the river in their strength, and my people and thine will be taken unawares if I fail to warn them. The fight will be to-night. Alas! alas! what shall I do with thee, Woonona?

'Stay!' she cried, clasping her arms about him. 'Stay! I knew that I should find my white brother, and save him. Stay with me, Jules, or I die.'

Jules Desbarres groaned like a man in torment while he carried her onward, his agile mind working to solve the dreadful problem of how to save her from the fiendish cruelty of the Iroquois.

While they were yet several miles from the fort he espied a small cave, on whose mouth the sun shone warmly, in the midst of a patch of rocky ground. Here he set her down.

'Woonona,' he said tenderly, looking in her eyes, 'I love thee better than life.'

She took his face between her hands, and smiled. 'I command thee, remain here till I come,' he said. 'If in three days I do not come, return to your people. But in case the Iroquois take thee, here is that which will deliver thee. Only swallow

this and have no fear of them. But do not swallow it till death is certain. Swear!'

'I swear,' she said, looking up in his face with the dumb trust of an animal. With a great cry, Jules Desbarres tore himself from her and ran towards the fort.

(To be continued.)

EXCURSION TRAINS: PRESENT AND PAST.

By G. A. SEKON, Editor of The Railway Magazine.

APPILY for excursionists of to-day, the necessity of getting up in the very early hours of the morning if one wishes to take advantage of the cheap fares of excursion trains has

almost become a thing of the past. Not only have the inconvenient hours of starting disappeared, but with them the slow speed; and on many lines the ramshackle rolling-stock in which in most cases excursion passengers formerly had to perform their uncomfortable and tedious journeys has disappeared also.

The commencement of these ameliorations in excursion traffic conditions is to be found in the half-day trips inaugurated some few years back from large centres of population in the Midlands to

It was evident, if travellers from such places a Birmingham, Wolverhampton, Nottingham, and Leicester were to be induced to leave their homes after midday, spend the late afternoon and evening in London, and arrive home soon after midnight, radical changes must be made in the working of excursion trains. The first improvement requisite was an increase of speed. People could not patrohise half-day excursions necessitating three hundred miles of railway travelling if ten hours out of a possible fourteen were to be spent in the train, so the new excursions were timed at express speeds. The next improvement was but a natural corollary of the acceleration of the excursion trains. The antiquated light-of-weight carriages were not suitable for running at express speed, so coaches heavier and better in every way had to be employed in these express excursions.

The half-day trips from the Midlands to London having proved so successful, it was not long before the enterprising Great Western and London and

North-Western Railways gave Londoners the opportunity of visiting Stratford-on-Avon by halfday excursions. These were highly successful, and similar trips were arranged to Weymouth, followed by excursions to nearer resorts on the Great Eastern system.

In August 1904 holiday-makers were astonished to learn that the Great Western Railway was advertising half-day trips to Weston-super-Mare, the trains running the whole one hundred and thirty-seven and a half miles, without an intermediate stop, in three hours-by corridor trainsat a fare of four shillings and threepence for the double journey, the charge working out at about one penny for five miles. About the same time the half-day excursion to Dorchester was quickened, the one hundred and forty-seven and a half miles being covered in three hours five minutes.

It goes without saying that, with the business acumen that characterises the management of the railways north of the Tweed, very liberal excursion arrangements are to be found in Scotland, where the economical practice of 'killing two birds with one stone' largely obtains. Special trains for excursionists are, of course, run; but this class of traffic is largely catered for by the issue of day-tickets available by the ordinary (including the express corridor) trains. For instance, on the North British Railway, the day-trip ticket from Carlisle to Aberdeen costs only five shillings and sixpence, although the journey in each direction is two hundred and twenty-nine miles. By the same railway, three hundred and forty miles is the distance from Edinburgh to Mallaig and back, whilst the 'there and back' distance between 'Auld Reekie' and Inverness is but eight miles less, yet but five shillings is asked for a day-trip ticket for either of these lengthy journeys. Long distance excursion trains

run by the North British Railway are booked to run at an inclusive speed of forty miles an hour, or over.

The Caledonian Railway will take one from Carlisle to Aberdeen and back, a distance of four hundred and eighty miles for the round trip, for the matter of five shillings and sixpence. What in railway parlance are known as 'guaranteed excursions' are very popular in Scotland, and for three shillings a head a train conveying five hundred passengers, or over, will be run one hundred and sixty miles; while for five hundred miles by such a train the fare will be only four shillings and sixpence. By these 'guaranteed' day excursions, the fare from Glasgow to Dingwall and back, a journey of four hundred miles, the charge is but four shillings.

In the matter of short distances, half-day or Saturday afternoon excursions, the Caledonian Railway offers facilities which are unique, besides being a marvel of cheapness. For instance, Aberdonians have a special non-stop excursion on Saturday afternoon to Brechin and Edzell, taking them to the base of the Grampians and back, a distance of nearly two hundred miles, for one shilling and sixpence or two shillings respectively.

From Glasgow to the Clyde coast there is a service of express trains and steamers by the Caledonian route which is unsurpassed in any other part of the world for comfort and promptitude. Passengers, for example, may leave the Central Station, Glasgow, any day during the season by an express train for Wemyss Bay or Gourock, there join the splendid steamer Duchess of Hamilton for an eight hours' cruise round the lochs and the Firth of Clyde, returning to Glasgow by another express train in the evening, for the remarkably low fare of four shillings.

The Glasgow and South-Western Railway conveys day-trippers from Glasgow to Carlisle and back, two hundred and thirty miles, by express trains, taking only about two and a half hours on each journey. The cost of this trip is but four shillings.

The Highland Railway will convey one in through excursion trains from Inverness to Glasgow and back, a distance of about three hundred and thirty miles, for five shillings; or, if the excursionist wants a longer railway ride for the same money, he can upon reaching Perth travel thence to, and return from, Glasgow by the North British Railway, and thus increase the distance travelled about twenty-two miles.

Whit-Monday of 1905 saw express half-day excursions in corridor coaches by the Great Northern Railway from King's Cross to far Skegness and back. These were advertised as 'non-stop,' but a halt was made at Spalding en route to replenish the water-supply of the locomotive. Some four thousand passengers availed themselves of the trip, six trains being required to convey them. So successful were these trips that last summer the Great Northern Railway was running the trains from

Leeds as well as from London to Skegness, and giving them a place in its time-tables, instead of advertising them as excursions.

Whit-Monday of last summer saw the Midland Railway as a wooer of the half-day excursionist, a trip being run from St Pancras to Matlock and back. So popular was it that the supply of special tickets gave out, and ordinary tickets stamped 'return' had to be used to supplement them.

Special corridor bogie coaches with lavatory accommodation, are being constructed by one railway exclusively for excursion traffic, so important is the new development expected to become.

What was the genesis of these cheap trips by railway? Simply the desire to enable teetotalers to attend temperance demonstrations. In 1841 a wood-turner of Leicester—Thomas Cook by name performed a fifteen miles' walk from his native town to Market Harborough to enable him to attend a temperance meeting. He beguiled the tedium of the walk by reading an account of the newly opened railways, and the thought occurred to him, 'Why not travel by train?' A temperance meeting was to be held at Loughborough in a few days, so Thomas Cook approached the directors of the Midland Counties Railway with a suggestion for a special train. He guaranteed sufficient passengers to make the running of the train profitable to the railway company, and on 5th July 1841 set out from Leicester to Loughborough with his first personally conducted tour, seven hundred and fifty passengers travelling by the train.

The success of the first excursion awakened in people who usually did not travel a desire to do so, and it will be of interest if we give some account of the earliest excursion trains.

It was at Easter, in 1844, that pleasure excursions appear to have first become general. Before this date some of the provincial lines had in the preceding summer run occasional trips, and the Great Western Railway, at Christmas 1843, had granted additional advantages for those anxious to visit their native places. On Easter Monday 1844 no less than thirty-seven thousand seven hundred and thirty-six travelled by the Greenwich Railway; while to Brighton was despatched a train of forty carriages drawn by four engines containing one thousand one hundred passengers; the train and passengers weighed three hundred tons, and exceeded three hundred yards in length. Upon these occasions the railway companies advertised 'an excursion train,' and ran one accordingly, for it appears as if the idea of dividing the train into several parts did not occur to those responsible for working the traffic. No doubt one reason for such management can be found in the fact that the signalling arrangements were of a very elementary description, and that no sufficient notice could be given to the officials on the other parts of the lines that special trains were being run, the electric telegraph not having been generally adopted by the railways, so that it was impossible at that time to give instantaneous notice to all concerned of any new arrangement.

The Grand Junction Railway, for the accommodation of this traffic, 'had their third-class carriages covered from the weather, so that they will now be on a footing with their second-class carriages, which they long ago set the example of closing in with glass.' The other lines soon followed the Grand Junction's lead, and advertised their excursions as being 'covered carriages,' which description survived in connection with excursion traffic on some railways until a decade or so back. In May 1884 we read that 'excursions also came off on the line between Cheltenham and Gloucester, on which occasion third-class carriages with seats were included in the arrangements.' From which we gather that up to that time the 'cheap trippers' had been obliged to stand when travelling at excursion fares

On the Whit-Monday of 1844 the Brighton Railway surpassed their Easter traffic. The first train from London Bridge to Brighton carried one thousand three hundred passengers in forty-four carriages, and at New Cross fifteen additional vehicles were added, the fifty-nine carriages being hauled by six locomotives. This train weighed four hundred and forty-five tons, and was the heaviest that had been conveyed on the Brighton Railway.

The excursions continued so to grow in popularity that a climax was reached on Sunday, September 1, no less than two thousand one hundred and fifty passengers booking to Brighton. These filled eighty carriages, and the company found it impossible to send all these forward as one train, so it was divided into three parts, each drawn by three engines.

On Monday, September 2, 1844, the Great Western Railway ran their first excursion from London. The train left London at 7 A.M. for Bath and Bristol, from which city it was continued on the Tuesday morning to Taunton and Exeter. The return train left Exeter at 4 P.M. on the same day, the night again being spent at Bristol or Bath, the passengers reaching London on Wednesday afternoon. The fares were: London to Bath and back, twenty-eight shillings first-class, nineteen shillings second; London to Bristol, thirty shillings first, twenty shillings second; London to Exeter, forty-eight shillings first, thirty-one shillings second. And if one person purchased twenty tickets or over, a discount of one shilling on each ticket was allowed. Some five hundred persons left Paddington by this maiden excursion of the Great Western Railway, and the number was doubled by those who joined the train at Slough, Reading, and other stations. This was the foundation of the famous broad-gauge excursions to the west of England that, until the

abolition of that gauge, grew yearly in popularity.

The Great North of England Railway ran an excursion from Darlington to Leeds, and covered the seventy miles in three and three-quarter hours, including stoppages. This was considered a quick journey for an excursion train.

In September 1844 the Manchester Guardian says: "The inhabitants of Hebden Bridge were delighted by a railway trip to Hull and back in one day at reduced fares. From an early hour in the morning numbers flocked from the hills and adjacent country, including many from Colne, Keighley, and Haworth. At seven o'clock the train, consisting of eighty-two carriages, drawn by three engines, started from Hebden Bridge Station, with two bands of music. At Normanton two engines of the York and North Midland were attached, and drew the long cavalcade to Selby, when it was drawn to Hull by two engines of the Hull and Selby Railway."

On Thursday, September 12, 1844, eight thousand passengers were conveyed from Leeds to Hull in two hundred and sixty carriages; but we have no information as to how many trains. On the same day one thousand five hundred excursionists were carried from Derby to York in fifty carriages; and, owing to both these excursions being on the same day, great difficulty was experienced in providing sufficient carriages to convey the traffic.

On the York and North Midland Railway it soon became general to send one engine with a train of forty carriages, and on two occasions one locomotive drew fifty-five loaded carriages. 'The majority of these passengers had never before travelled in a railway carriage, and consequently they require more watchfulness in preserving them from danger when getting in and out of the carriages.'

The North Union Railway conveyed two thousand two hundred and sixty-six passengers to Fleetwood in one train, while on the Liverpool and Manchester nearly three thousand were carried to the former place in one train.

One train on the Preston and Wyre Railway took one thousand four hundred and twenty-one passengers from Preston to Fleetwood. The train was drawn by one locomotive.

The Newcastle and Darlington Railway despatched an excursion to York on September 23, 1844, by which were carried four hundred and sixty-four first-class passengers at five shillings each, eight hundred and eighty second-class at four shillings, and five hundred and forty-three third-class at three shillings, or one thousand eight hundred and eighty-seven passengers and a total revenue of three hundred and seventy-three pounds nine shillings from one train. These figures are enough to make our present-day traffic superintendents turn green with envy.

On October 17, 1844, after the excursion traffic was over, the Board of Trade suddenly woke up to the fact that the railway companies required its valuable advice as to how to manage the excursion traffic, and a long circular was addressed to the managers of the various railways. The Board suggested that the speed of these trains should not exceed fifteen miles an hour, that the carriages should be on springs, and that extra guards should accompany the trains to enforce the railway com-

panies' bylaws and preserve order among the passengers. The railway companies made great sport of this circular, since it was not issued until the excursion traffic was over for the season; while the various railway papers discussed it in a style of mock gravity. One paper described this circular as 'the most extraordinary of all the extraordinary manifestoes of the Board of Trade—a manifesto in

which nothing is manifested except addle-headed senility and a wish to meddle with what they do not understand.'

The success of this first season of excursion trains caused the various railways to continue the policy in the following year, and the traffic has since grown into a developed part of railway management.

CHAPTER V.

IX weeks after Hoppy's trial—for the proceedings had to voyage to England and back—a large body of officers were again assembled, this time in the spacious mess-room of the Sooties, all those available of

that distinguished regiment being present, as well as representatives—by order—of every other military unit in cantonments. Once more poor Hoppy, without his sword and paler than ever, stood up before the throng. Beside him stood the acting adjutant of his corps-Vare having gone home to England on six months' sick-leave-holding in his hand a great sheaf of blue papers. These, at a sign from his colonel, he began to read aloud, gabbling away at top speed through all the stilted, would-be legal rigmarole that every man there present knew almost by heart. At last, however, these words were clearly heard: 'Guilty of all the charges,' followed by more mumblings, and then slowly and distinctly rang out those which all were anxiously waiting to hear:

'The court sentence Lieutenant F. L. E. Apner, One Hundred and Sixty-first Rifles, to be reprimanded and cashiered.

'Confirmed.

'(Signed) J. RANGER, Commanding Rhanibad.

'Approved; but I remit "to be cashiered."

'(Signed) WILLIAM, Commander-in-Chief.'

The start of astonishment which had run through the ranks of the assembly as they listened to such a severe sentence was succeeded by a faint murmur of relief as the mitigation of the punishment was heard. And the reprimanding having been already carried out by the mere fact of its announcement, there remained nothing more but for the adjutant to return Hoppy his long-lost sword and offer him the first of a stream of congratulations which now flowed upon him from all sides.

But the released man had small inclination to listen to anything just then. The words 'to be cashiered' rang through his head with persistent iteration, and he longed to get back to his own room and rest his throbbing brain. So he quickly pushed

his way out of the place and departed, repeating to himself time after time, as if he could not credit his ears, 'To be cashiered! to be cashiered!'

Arriving at his quarters, he locked the door, and sitting down on the edge of his camp-bed, buried his face in his hands; and what if one or two scalding tears did force themselves out between his fingers? A man of grit sobs, perhaps, not once since he attains his majority; but when he does it is a bad thing to see, and means that his feelings, trained in the stern school of repression, are in a state of sustained tension quite beyond the understanding of his weaker brethren.

To be cashiered! Oh, the disgrace of the thing! What did it matter that the Commander-in-Chief had remitted the sentence? It did not alter the fact that his conduct had appeared to a large tribunal of his comrades-in-arms deserving of such a punishment! Of course, had it not been for powerful influence at home, he told himself, the sentence would have stood as it had originally been given. He knew, and so did everybody else, that it was only because he was the son of his father and the prospective son-in-law of a wealthy Peer that the head of the army had interfered. There was no getting away from it. Friendly, but straightthinking, soldiers had found that his behaviour had merited a punishment almost as bad to a sensitive man as death; and come what might, and carve he ever such a successful career for himself in the future, he would always be known until the end of his life as a man who had once been cashiered, but been saved from the actual 'kick-out' by backstair influence at headquarters. He little knew-because of the oath of secrecy taken by courts-martial-that when deliberating upon his sentence the members had in some way received the impression-they never understood exactly how-that the punishment they ultimately awarded him was the only one acceptable to the authorities, as upholding the necessary stern discipline which must prevail for the security of all in time of war; and that it had also been buzzed about in a similarly unaccountable manner that Sir John Ranger's confirmation would also carry with it a private request to the 'great man' for a remission of the severer portion. This

he would never know, and would never guess at; and so the one crumb of comfort he might have gathered, the one little bit of knowledge that would in all probability have altered the whole subsequent course of events, was of necessity withheld from him even by those-and there were several-amongst his late judges who were reckoned his very particular friends. He must, of course, resign his commission as soon as the stir caused by his trouble had been forgotten—a matter of a couple of weeks at most, he told himself; and then he would go home and live quietly with his father until the time came for him to claim Lord Idsworth's daughter. But could he? Would it be honourable? Would Mirabelle, his darling-proud Belle -link herself for life to such as he? 'To be cashiered! to be cashiered!' Would it never stop ringing in his head, that awful sentence? He vividly remembered their last conversation ere he sailed, and her softly whispered words, 'Goodbye, my sweetheart; good-bye. Come back to me safe and sound in body and heart, Captain Hoppy

'Ha, ha!' he laughed bitterly. 'Of course I shall come back to her Hoppy, V.C. Very much so, only the letters she sets such store upon will not mean the little bit of bronze, but "very cashiered." Ha, ha, ha! capital joke that; hope she'll like it.' And again the horrid laugh, so unlike his usual one, echeed through the empty passages.

Suddenly his mood changed. He sat silently staring at the opposite wall for several minutes, motionless except for a nervous pulling at his fingers, a peculiar habit of his when engaged in considering knotty questions. There was a strange silence about; the neighbourhood, usually so noisy with the comings and goings of other subalterns, appeared quite deserted—perhaps by chance, perhaps delicately designed to allow him to get over his late trying ordeal in peace and quiet. He noticed it as he presently got upon his feet and walked across to his despatch-box, which stood upon the top of his military chest of drawers; but in his present temper he mistook its cause.

'Not only to be cashiered,' he sneered, quite forgetful of the congratulations of not long before, but sent to Coventry as well. All right, my fairwather friends; you need not be so very virtuous. I sha'n't shock you by my tainted presence much longer, humbugs!'—which unjust remarks show how perverted and distorted can our judgment become when we are labouring under the influence of imaginary slightings

Using a small key which hung upon his watch-chain, he unlocked the box, and taking out a square photograph-case of stamped leather, he opened it used to be used to b

bit of cardboard; and then, with a heavy sigh, as if resigning his hopes of heaven—as indeed he was—he replaced it in the box, snapped the lock, and with quiet deliberation took down from the wall an ugly-looking, bottle-shaped case of weather-stained brown leather.

Quickly opening it, as if the time had now come to hurry, he pulled out a large service-revolver, the same useful implement that he had carried with him in case of accidents-for you don't fall alive, if you can help it, into Asiatic hands—on that eventful day fraught with such evil consequences to him, which now seemed so far, so very far, away. It was unloaded, and six times he pulled the trigger and clicked the hammer, in case a grain of saud might have got into the mechanism and interfered with its deadly action. But Rex, who looked after the weapon, was far too good a soldier to neglect a little job so congenial to his love of all that pertained to shooting, and so no minute particle of flint, no little obstruction of any kind, had found a home among the springs and levers to delay the coming tragedy.

Muttering to himself, 'Two will be enough, I think. I surely sha'n't want more. Shall I write a line? No, not a word; it will be best for all that way,' he took from a table-drawer a small, square-shaped packet of something wrapped in strong brown paper, covered with black marks and letters, mysterious signs to the uninitiated, but denoting Government cartridges to the soldier. It was tied about securely with thick string, which he was rapidly proceeding to unloose, when a heavy footfall, apparently coming in his direction, rang along the passage outside.

Hoppy paused in his task while he listened; but as the steps halted at his door and a hand tried the handle, he feverishly recommenced to fumble at the stubborn knots.

'Hoppy,' cried a voice, 'may I come in?' But the wretched man gave no sign. He had locked the door; he need not fear interruption for the moment.

'Queer!' grumbled the visitor. 'I'm almost certain that he is there. Hoppy! I say, Hoppy, old chap, hang it all, are you asleep?'

But Hoppy still kept silent, and the string was untied now.

'Here goes, then,' cried the voice savagely; and, the rotten lock giving way under pressure from a stout shoulder, the door flew open just in time to allow the unceremonious intruder, with a wild, understanding yell, to rush forward and knock up the madman's arm as the hammer fell, and the slim bullet, ripping through ceiling and roof, went singing away up into the blue sky instead of through Hoppy's brain.

'Good heavens, man!' gasped the new arrival, as he deftly twisted the revolver out of the other's hand before the latter had time to realise exactly how it happened that he still was standing up alive and with a whole skin, 'you, of all people in the world, to be indulging in such monkey-tricks! You

ought to be ashamed of yourself, at your age, playing with a loaded revolver like any newly joined "griffin" handling a shooting-iron for the first time. Yes; no wonder you look like a silly cuckoo,' he continued vehemently. 'The only excuse that you can have is that the long arrest, and then the tommy-rot you have just been through in the mess, has set you a bit off your chump. Now, look here, my old son, just you give me your word of honour that you'll quit fooling around with any dangerous things of any kind whatever, or I'll march you off, whether you like it or not, straightway to the chief's bungalow, and tell him—well, I'll tell him exactly what has happened.'

'All right, old fellow,' answered the culprit as he grasped the other's hand. It was a young captain in his regiment, and a particular friend of his. 'I think I must have been, as you say, a little dotty on the crumpet,' smiling feebly; 'and I really have had a terribly bad time, as you know. But you need not be afraid. I am quite myself again now; and if only my head would get better, and cease ringing with those beastly words I heard this morning, I'd be able to think things over calmly. I'll lie down now for a bit,' he continued, 'and try and get as sleep, which I rather want, for ever since I heard that the papers had come back from England I haven't had a wink, as you may understand.'

'Best thing you can do, you poor old flea!' gently answered his friend, allowing himself the luxury of as much expression of feeling as the unwritten laws of his caste permitted. '1'll come and look you up again in a couple of hours. So long;' and he whistled himself away, slamming the door behind him, his warm heart genuinely aching for his chum's troubles in spite of his assumed jocularity.

When, true to his promise, he returned a few hours later to Hoppy's quarters, he found the latter's native servant fidgeting about the bed, whereon was lying his luckless master in the delirium of a sharp attack of fever.

The streets in the neighbourhood of St James's abound in quiet lodging-houses, whose tenantsretired butlers and valets for the most part-provide clean little rooms where that unique product the British officer is wont to roost in his periodical visits to town. Each has its own clientèle, as often as not drawn from but three or four regiments, and any observant person may note between the hours of 10 and 11 A.M. on week-days, and much later on Sundays, a continual opening and shutting of dingy doors as they disgorge numbers of cleanlimbed, well-groomed, sunburnt men, dressed in the perfection of quiet good taste, such as no other army in the world can show. Every Saturday afternoon Aldershot, Chatham, Colchester, all the garrison towns within reach of London, send up their quota, glad to escape from the monotony of barrack-life, to return thereto by the last train next day all the brighter for their visit to theatre or ballroom and a sight of their relations and friends. They sleep and breakfast at their lodgings, feeding at their clubs or elsewhere, and seldom come back to their rooms during the day until it is time to dress for dinner. As they are usually rather late for this important operation—for the correct tying of their white ties requires infinite time and patience—they return in unholy haste, striding along the narrow streets with coat-tails flying, or more often peering over the doors of darting, rubber-tired hansoms.

In one of these military nests, then, had Captain Vare bestowed himself on his arrival in England, ready to enjoy to the full his six months' leave of absence, and to bask in the smiles of sundry foolish hostesses who were anxious to 'lionise,' not the hero, it is true, but what was nearly as useful for their purpose, the other man concerned in a business which had set half London talking. As a matter of fact, they were rather glad than otherwise that it was only the second fiddle they had got among them, for his face was adorned with a conspicuous scar—which the other man, who was supposed to be in chains in Indian dungeons, would not have possessed—which greatly increased the éclat that his presence gave to their precious parties.

Thus the dapper captain found himself very much in request, many people, indeed, believing that it was he who at immense risk, and after performing prodigies of valour, had saved somebody's life somewhere. And the scar, which showed up so fascinatingly white against the slightly browned face, increased his prestige, and was, by the dear ladies, popularly supposed to be but the smallest of the many wounds which they credited him with bearing about his delicate little body.

Attired in a gorgeous dress-suit whose wonderfully embroidered satin cuffs and collar suggested to those privileged to behold it the work of some adoring fair one - which soft impeachment he neither accepted nor denied, though in reality the things came out of Bond Street-Captain Vare sat in the miniature sitting-room attached to his bedroom discussing what soldiers newly arrived from the East are wont to call a 'Europe breakfast.' The advantages enjoyed by this meal over those of its Asiatic rival appear to the uninitiated to consist in lateness of hour and its dishes of fresh smoked haddock and luscious kidneys and bacon. A daily paper, propped up against the toast-rack, spread its many columns of mostly inaccurate information before him, and as he munched his food and sipped his tea he lazily scanned the morning's news with an air of quiet contentment.

Suddenly his jaws ceased working. He bent his head sharply forward, and dropping his knife and fork after a second's eager scrutiny, he seized the paper with both hands, and pushing back his chair from the table, proceeded to read with the liveliest interest a small, unobtrusive paragraph in which a certain name had attracted his attention. It was as follows:

'A telegram has reached the War Office that the

sentence of the court-martial which some weeks ago was held in India on Lieutenant Apner of the One Hundred and Sixty-first Rifles was duly made known yesterday. This young officer, whose case created great interest during the late frontier troubles, owing to the diversity of opinion as to

his conduct at Rhanibad, which was very gallant though contrary to discipline, has been condemned to be reprimanded and cashiered. The Commanderin-Chief, however, has remitted the last portion of the sentence, leaving only the reprimand.'

(To be continued.)

THE EXERCISE OF THE FUTURE.

By EUSTACE MILES.

MONG the most marked features of recent years has been the study of diet. Side by side with it, as a means towards greater health and fitness, has come the study of exer-

cise, now as a fellow-worker with diet, now as a rival. In addition to the drug-advertiser, who claims that his drug is the panacea, and that nothing else is needful for physical well-being, there have arisen the food-advertiser, who claims that his food is the panacea, and the so-called 'physical culture' advertiser, who claims that his apparatus or his exercises are the panacea.

As Dr Josiah Oldfield has written in this Journal for January about the diet of the future, it is appropriate to supplement what he says by writing of the exercise of the future. Before I begin, however, I had better discuss briefly two questions. This discussion will clear the way for our subject. First, which will be the more important factor in national prosperity-diet or exercise? Undoubtedly, diet; for it adds new elements that become integral parts of the body; and the ideal diet will be as free as possible from elements that clog or break down the body. But exercise will not be far behind in influence; for it will help the body to use the food, to get rid of the waste, to take in fresh air, to work successfully, and—a most important, and therefore most neglected, art-to economise energy and to rest. Secondly, what is the exercise of the present? For the great majority of city-dwellers, who form three quarters of our population, the chief exercises of the present are walking and sitting, and they are performed remarkably badly. It may sound a paradox to call sitting an exercise; but it is one. It involves the use of strong muscles to hold the body in position. The result of sitting, as compared with lying, is a decided increase in the number of heart-beats; the result of walking is a still further increase.

With regard to walking, excellent as it is, it is not a complete exercise. Only an ignoramus can say that it is. It uses a great many muscles, but it does not use all; neither does it use enough muscles fully—I mean in the sense of stretching them fully and contracting them fully. It does not empty the minute blood-vessels thoroughly; it does not squeeze and shake the liver adequately. It will not be the sole, or even the chief, exercise of the future as it is of the present.

In addition to walking and sitting, cycling and gymnastics, and what is dignified by the term 'physical culture,' have been coming into vogue of late years. The ordinary gymnastics and 'physical culture' will have to be altered very considerably before they are fitted to survive. Gymnastics and a good deal of 'physical culture' with apparatus (especially heavy dumb-bells, grip-bells, and strainwork developers) involve a vast amount of stiff and heavy and utterly monotonous work, of which a very little should go quite far enough.

As to remedial 'physical culture' with scientific apparatus—for example, apparatus for curing round shoulders—that is a different matter. So is the physical culture of the better systems, such as the Ling. But even here there is a tendency to a smug self-satisfaction, as if the end of knowledge had been reached and the ideal had become the actual. There is not an existing system that has not a mighty lot of useful truth to learn.

Then there are boxing, fencing, singlestick, wrestling, and jujitsu. These are already excellent. Then there are games and athletics, such as cricket, football, hockey, fives, badminton, lawntennis, lacrosse, vigoro, and the sports, &c. These, as they are, are also excellent for those who have the space in which to play, and also the time and money. But the majority of people will not play these games as they now are. There will have to be some real changes made, chiefly in the direction of adaptations and additions. Then there is horseriding. This will not be a popular exercise; it is too expensive.

Much the same applies to the sports that take life—hunting, fishing, shooting, &c.—which a more obvious objection will some day help to abolish. Archery, target-shooting, however, and drilling—on more sensible lines than at present—will be in vogue, not so much from the desire to kill as from the desire to be so ready to defend home and country as to make an attack by any enemy utterly unlikely. Swimming and rowing are already popular. They will become more so.

This short and singularly incomplete sketch, which purposely omits many branches of exercise—motoring, farm-work, gardening, carpentering, building, &c.—has already served to point out what I think to be some of the directions in which the exercise of the future will differ from the exercise of the present.

The most striking feature of the exercise of the future will be that it is for all, not for a comparatively small section of the people. True, there will be many differences between the exercises of one age, one group, one class, and those of another age, group, and class. But there will assuredly be a common foundation. This foundation will include the correct ways of breathing, standing, walking, running, swimming, sitting, lying, relaxing, and so on. For example, instead of the development of one, and only one, way of breathing, as if this were the only way, every one who does not naturally breathe well will be taught the way to use and train the various breathingslower, middle, and upper-till the right way becomes automatic. At present only a few breathe satisfactorily. These are, for the most part, those who breathe satisfactorily by the light of nature without any special teaching; the rest are apt either to learn some one-sided system or else to go on in their perverted habits.

In the future the authorities-and through them the parents and school masters and mistresses-will teach children not only how to breathe, but also how to stand so that the chin will not poke forward, nor the spine be abnormally curved (partly through the habit of lopsided standing and sitting), nor the abdomen be projected, and so on. They will teach children how to walk and how to run with free and direct steps, and with the minimum of energy and the maximum of grace. They will teach children how to swim, making them first master the movements of the breast-stroke on land. And so forth.

The exercise of the future will, then, begin with the children, as does the education of the Hindus, whose children are taught not only about God the All-Father, but also about the right way to breathe and hold the body and relax the muscles. follows, as a corollary, that the exercise of the future will not be tedious and monotonous, but will be brief and interesting. If not at first, yet at least after a little practice, it will become enjoyable by itself, for its own sake, as washing is to a healthy man. It follows, as a second corollary, that the exercise of the future will be one of the chief considerations and studies of the best, the most refined and intelligent and painstaking, men and women in the nation.

Contrast the present state of affairs. First, there is fundamental training in the A B C of the body's arts for remarkably few. I may deviate for a moment to point out how the exercise of the future will be for all. At present authorities and individuals excuse themselves by saying that there is no time and no space for exercise. This, in the future, will be regarded as the sheerest nonsense, like the excuse of the lazy man who said that he had forgotten to rise in the morning. The exercise of the future, at least in this fundamental department, in the A B C of the body's arts, will find brief time and narrow space ample for its purposes.

The authorities and individuals will see things in perspective. They will begin by stealing time and space in a half-guilty and apologetic way. They will end by refusing to let this time and space be taken away from them. They will realise that an integral part of the liberty of the subject is both time and space for fundamental exercises.

The first contrast, then, is that at present there is fundamental training for remarkably few, and there is supposed to be no time or space for exercise for the majority. The second contrast is that at present the exercises offered to the few are, for the most part, tedious and monotonous, the varied and exciting exercises-such as golf and footballbeing assumed to be out of the question because of the lack of money to pay for them. In other words, the ordinary person thinks that he has to choose between long and dull drill-mostly strain-and-stress movements of the most desperately inhuman and unattractive shape-and costly yet expensive play-for example, to take two extremes, between the old army exercises still taught by some ignoramuses and a game of real tennis costing several shillings. In the future there will be a choice between 'physical culture' of an enjoyable kind, which will not be a severe tax on time or energy, and games and sports of a cheap kind, which will not be a severe tax on time or energy

or money either.

Games and sports at present seem to be confined to the few. Take lawn-tennis or fives, for instance. Admirable exercises, training the intelligence and character as well as the muscles, they are imagined to be out of reach of the masses, though it must be clear to all thinkers that the masses need and deserve such games every whit as much as the 'classes.' How will the future provide for the masses? First, it will popularise many games and sports now forgotten or despised. It will treat with respect not only cricket and football, but also prisoner's base, rounders, catch, dart-throwing, bowls, quoits, and dozens of other healthy amusements. It will provide cheap facilities for these amusements, and also for adapted forms of the already honoured games. For example, in addition to the cricket of the field-long may it reign !there will be adapted cricket, perhaps with small bats and soft balls, in courtyards (as in the Eltringham Street Council School's yard at Wandsworth), on flat roofs, in large bare rooms, and so on, as well as practice-nets in gymnasia (as in the St Bride Institute). In addition to the racquets of the racquet-court, there will be adapted racquets (or squash, as it is called) and fives, with soft balls, up against any wall. Secondly, the future, besides popularising the good but now neglected games, and adapting the now honoured games and providing facilities for them, will train children to play these games without injury and with success.

One of the bitterest yet fairest charges against the exercise of the present day is that of excess. It is urged that we, as a nation, play games too much

The accusation can only be made by the slipshod and unobservant, who have not studied the masses. It is only a few, comparatively, who play games too much. Most people -men, women, and childrendo not play nearly enough. But undoubtedly the few do play too much, wasting time and money, and straining themselves. In the future there will be moderation in play. And where there is excess, as there will certainly be, that excess will be less fatal than it is now. Why? Because the children of the future will have been trained, as I said before, in the fundamentals, in the A B C of the body's arts, one of which arts is play. They will have been trained to breathe well, to move well, to rest and relax well. What does this mean-to breathe well, to move well, to rest and relax well? How can we learn these habits? many readers are sure to wish to know. And I think that after a minute's reflection they will see in what direction my article points, and what a terrible mistake we are making in the present.
